Package ‘BayesSUR’

November 30, 2021

Type Package
Title Bayesian Seemingly Unrelated Regression
Version 2.0-1
Date 2021-11-29
Description Bayesian seemingly unrelated regression with general variable selection and dense/sparse covariance matrix. The sparse seemingly unrelated regression is described in Bottolo et al. (2021) <doi:10.1111/rssc.12490>, and the software paper is in Zhao et al. (2021) <arXiv:2104.14008>.

Author Marco Banterle [aut], Zhi Zhao [aut, cre], Leonardo Bottolo [ctb], Sylvia Richardson [ctb], Waldir Leocnio [ctb], Alex Lewin [aut], Manuela Zucknick [ctb]
Description

Main function of the package. Fits a range of models introduced in the package vignette BayesSUR.pdf. Returns an object of S3 class BayesSUR. There are three options for the prior on the residual covariance matrix (i.e., independent inverse-Gamma, inverse-Wishart and hyper-inverse Wishart) and three options for the prior on the latent indicator variable (i.e., independent Bernoulli, hotspot and Markov random field). So there are nine models in total. See details for their combinations.

Usage

BayesSUR(
  data = NULL,
  Y,
  X,
  X_0 = NULL,
)
covariancePrior = "HIW",
gammaPrior = "hotspot",
betaPrior = "independent",
nIter = 10000,
burnin = 5000,
nChains = 2,
outFilePath = "",
gammaSampler = "bandit",
gammaInit = "R",
mrfG = NULL,
standardize = TRUE,
standardize.response = TRUE,
maxThreads = 1,
output_gamma = TRUE,
output_beta = TRUE,
output_Gy = TRUE,
output_sigmaRho = TRUE,
output_pi = TRUE,
output_tail = TRUE,
output_model_size = TRUE,
output_model_visit = FALSE,
output_CPO = FALSE,
output_Y = TRUE,
output_X = TRUE,
hyperpar = list(),
tmpFolder = "tmp/"
)

Arguments

data a numeric matrix with variables on the columns and observations on the rows, if arguments Y and X (and possibly X_0) are vectors. Can be NULL if arguments Y and X (and possibly X_0) are numeric matrices.

Y, X vectors of indices (with respect to the data matrix) for the outcomes (Y) and the predictors to select (X) respectively; if the data argument is NULL, these needs to be numeric matrices containing the data instead, with variables on the columns and observations on the rows.

X_0 vectors of indices (with respect to the data matrix) for the fixed predictors that are not selected, i.e. always included in the model; if the data argument is not provided, this needs to be a numeric matrix containing the data instead, with variables on the columns and observations on the rows.

covariancePrior string indicating the prior for the covariance $C$; it has to be either HIW for the hyper-inverse-Wishar (which will result in a sparse covariance matrix), IW for the inverse-Wishart prior ( dense covariance ) or IG for independent inverse-Gamma on all the diagonal elements and 0 otherwise. See the details for the model specification
BayesSUR

- **gammaPrior**: string indicating the gamma prior to use, either hotspot (default) for the Hotspot prior of Bottolo (2011), MRF for the Markov Random Field prior or hierarchical for a simpler hierarchical prior. See the details for the model specification.

- **betaPrior**: string indicating the prior for regression coefficients; it has to be either independent for independent spike-and-slab priors (only slab part for $X_0$ if specified), or reGroup for weakly normal priors for mandatory variables (random effects) and spike-and-slab priors for other variables.

- **nIter**: number of iterations for the MCMC procedure. Default 10000.

- **burnin**: number of iterations to discard at the start of the chain. Default is 5000.

- **nChains**: number of parallel tempered chains to run (default 2). The temperature is adapted during the burnin phase.

- **outFilePath**: path to where the output files are to be written.

- **gammaSampler**: string indicating the type of sampler for gamma, either bandit for the Thompson sampling inspired sampler or MC3 for the usual MC^3 sampler. See Russo et al. (2018) or Madigan and York (1995) for details.

- **gammaInit**: gamma initialisation to either all-zeros (0), all ones (1), MLE-informed (MLE) or (default) randomly (R).

- **mrfG**: either a matrix or a path to the file containing (the edge list of) the G matrix for the MRF prior on gamma (if necessary).

- **standardize**: logical flag for X variable standardization. Default is standardize=TRUE. The coefficients are returned on the standardized scale.

- **standardize.response**: logical flag for Y standardization. Default is standardize.response=TRUE.

- **maxThreads**: maximum threads used for parallelization. Default is 1. Reproducibility of results with set.seed() is only guaranteed if maxThreads=1.

- **output_gamma**: allow (TRUE) or suppress (FALSE) the output for gamma. See the return value below for more information.

- **output_beta**: allow (TRUE) or suppress (FALSE) the output for beta. See the return value below for more information.

- **output_Gy**: allow (TRUE) or suppress (FALSE) the output for Gy. See the return value below for more information.

- **output_sigmaRho**: allow (TRUE) or suppress (FALSE) the output for sigmaRho. See the return value below for more information.

- **output_pi**: allow (TRUE) or suppress (FALSE) the output for pi. See the return value below for more information.

- **output_tail**: allow (TRUE) or suppress (FALSE) the output for tail (hotspot tail probability). See the return value below for more information.

- **output_model_size**: allow (TRUE) or suppress (FALSE) the output for model_size. See the return value below for more information.

- **output_model_visit**: allow (TRUE) or suppress (FALSE) the output for all visited models over the MCMC iterations. Default is FALSE. See the return value below for more information.
BayesSUR

output_CPO allow (TRUE) or suppress (FALSE) the output for (scaled) conditional predictive ordinates (*.CPO_out.txt), CPO with joint posterior predictive of the response variables (*.CPOsummary_out.txt) and widely applicable information criterion (*.WAIC_out.txt). See the return value below for more information.

output_Y allow (TRUE) or suppress (FALSE) the output for responses dataset Y.

output_X allow (TRUE) or suppress (FALSE) the output for predictors dataset X.

hyperpar a list of named hyperparameters to use instead of the default values. Valid names are mrf_d, mrf_e, a_sigma, b_sigma, a_tau, b_tau, nu, a_eta, b_eta, a_o, b_o, a_pi, b_pi, a_w and b_w. Their default values are a_w=2, b_w=5, a_omega=2, b_omega=1, a_o=2, b_o=p-2, a_pi=2, b_pi=1, nu=s+2, a_tau=0.1, b_tau=10, a_eta=0.1, b_eta=1, a_sigma=1, b_sigma=1, mrf_d=-3 and mrf_e=0.03. See the vignette for more information.

tmpFolder the path to a temporary folder where intermediate data files are stored (will be erased at the end of the chain). It is specified relative to outFilePath.

Details

The arguments covariancePrior and gammaPrior specify the model HRR, dSUR or SSUR with different gamma prior. Let \( \gamma_{jk} \) be latent indicator variable of each coefficient and \( C \) be covariance matrix of response variables. The nine models specified through the arguments covariancePrior and gammaPrior are as follows.

<table>
<thead>
<tr>
<th>( C ) ~</th>
<th>( \gamma_{jk} ) ~</th>
<th>HRR</th>
<th>dSUR</th>
<th>SSUR</th>
</tr>
</thead>
<tbody>
<tr>
<td>indep</td>
<td>Bernoulli</td>
<td>B</td>
<td>B</td>
<td>B</td>
</tr>
<tr>
<td>IW</td>
<td>hotspot</td>
<td>H</td>
<td>H</td>
<td>H</td>
</tr>
<tr>
<td>HIW</td>
<td>MRF</td>
<td>M</td>
<td>M</td>
<td>M</td>
</tr>
</tbody>
</table>

Value

An object of class BayesSUR is saved as obj_BayesSUR.RData in the output file, including the following components:

- status - the running status
- input - a list of all input parameters by the user
- output - a list of the all output filenames:
  - "*_logP_out.txt" - contains each row for the 1000t-th iteration’s log-likelihoods of parameters, i.e., Tau, Eta, JunctionTree, SigmaRho, O, Pi, Gamma, W, Beta and data conditional log-likelihood depending on the models.
  - "*_gamma_out.txt" - posterior mean of the latent indicator matrix.
  - "*_pi_out.txt" - posterior mean of the predictor effects (propensity) by decomposing the probability of the latent indicator.
  - "*_hotspot_tail_p_out.txt" - posterior mean of the hotspot tail probability. Only available for the hotspot prior on the gamma.
  - "*_beta_out.txt" - posterior mean of the coefficients matrix.
  - "*_Gy_out.txt" - posterior mean of the response graph. Only available for the HIW prior on the covariance.
BayesSUR

- ".*_sigmaRho_out.txt" - posterior mean of the transformed parameters. Not available for the IG prior on the covariance.
- ".*_model_size_out.txt" - contains each row for the 1000-th iteration's model sizes of the multiple response variables.
- ".*_model_visit_gy_out.txt" - contains each row for the nonzero indices of the vectorized estimated graph matrix for each iteration.
- ".*_model_visit_gamma_out.txt" - contains each row for the nonzero indices of the vectorized estimated gamma matrix for each iteration.
- ".*_CPO_out.txt" - the (scaled) conditional predictive ordinates (CPO).
- ".*_CPOsumy_out.txt" - the (scaled) conditional predictive ordinates (CPO) with joint posterior predictive of the response variables.
- ".*_WAIC_out.txt" - the widely applicable information criterion (WAIC).
- ".*_Y.txt" - responses dataset.
- ".*_X.txt" - predictors dataset.
- ".*_X0.txt" - fixed predictors dataset.

• call - the matched call.

References

Examples

data("exampleEQTL", package = "BayesSUR")
hyperpar <- list( a_w = 2 , b_w = 5 )
set.seed(9173)
fit <- BayesSUR(Y = exampleEQTL[["blockList"]][[1]],
X = exampleEQTL[["blockList"]][[2]],
data = exampleEQTL[["data"]], outFilePath = tempdir(),
nIter = 100 , burnin = 50, nChains = 2, gammaPrior = "hotspot",
hyperpar = hyperpar, tmpFolder = "tmp/", output_CPO=TRUE)

## check output
# show the summary information
summary(fit)

# show the estimated beta, gamma and graph of responses Gy
plot(fit, estimator=c("beta","gamma","Gy"), type="heatmap")
## Not run:

```r
# Set up temporary work directory for saving a pdf figure
td <- tempdir()
oldwd <- getwd()
setwd(td)

# Produce authentic math formulas in the graph
plot(fit, estimator=c("beta", "gamma", "Gy"), type="heatmap", fig.tex = TRUE)
system(paste(getOption("pdfviewer"), "ParamEstimator.pdf"))
setwd(oldwd)
```

## End(Not run)

---

### Description

Run a SUR Bayesian sampler – internal function

### Arguments

- **dataFile**: path to data file
- **outFilePath**: path to where the output is to be written
- **nIter**: number of iterations
- **nChains**: number of parallel chains to run

**NOTE THAT THIS IS BASICALLY JUST A WRAPPER**

---

### coef.BayesSUR

**coef method for class BayesSUR**

### Description

Extract the posterior mean of the coefficients of a BayesSUR class object

### Usage

```r
## S3 method for class 'BayesSUR'
coef(object, beta.type = "marginal", Pmax = 0, ...)
```
elpd

elpd

elementary log pointwise predictive density

description
Measure the prediction accuracy by the elpd (expected log pointwise predictive density). The out-of-sample predictive fit can either be estimated by Bayesian leave-one-out cross-validation (LOO) or by widely applicable information criterion (WAIC) (Vehtari et al. 2017).

usage
elpd(object, method = "LOO")

arguments
object
an object of class BayesSUR
beta.type
type of output beta. Default is marginal, giving marginal beta estimation. If beta.type="conditional", it gives beta estimation conditional on gamma=1.
Pmax
If Pmax=0.5 and beta.type="conditional", it gives median probability model betas. Default is 0.

value
Estimated coefficients are from an object of class BayesSUR. If the BayesSUR specified data standardization, the fitted values are base based on standardized data.

examples

data("exampleQTL", package = "BayesSUR")
hyperpar <- list( a_w = 2, b_w = 5 )

set.seed(9173)
fit <- BayesSUR(Y = exampleEQTL[["blockList"]][[1]],
X = exampleEQTL[["blockList"]][[2]],
data = exampleEQTL[["data"]], outFilePath = tempdir(),
nIter = 100, burnin = 50, nChains = 2, gammaPrior = "hotspot",
hyperpar = hyperpar, tmpFolder = "tmp")

## check prediction
beta.hat <- coef(fit)
Arguments

object  an object of class BayesSUR
method  the name of the prediction accuracy index. Default is the "LOO" (Bayesian LOO estimate of out-of-sample predictive fit). The other index is the "WAIC" (widely applicable information criterion). For the HRR models, both "LOO" and "WAIC" are computed based on the multivariate t-distribution of the posterior predictive rather than approximation of importance sampling.

Value

Return the prediction accuracy measure from an object of class BayesSUR. It is elpd.loo if the argument method="LOO" and elpd.WAIC if method="WAIC".

References

Examples

data("exampleEQTL", package = "BayesSUR")
hyperpar = list( a_w = 2 , b_w = 5 )

set.seed(9173)
fit <- BayesSUR(Y = exampleEQTL["blockList"][1], X = exampleEQTL["blockList"][2], data = exampleEQTL["data"], outfilePath = tempdir(), nIter = 100, burnin = 50, nChains = 2, gammaPrior = "hotspot", hyperpar = hyperpar, tmpFolder = "tmp/", output_CPO=TRUE)

## check output
# print the prediction accuracy elpd (expected log pointwise predictive density)
# by the Bayesian LOO estimate of out-of-sample predictive fit
elpd(fit, method="LOO")

exampleEQTL  Simulated data set to mimic a small expression quantitative trait loci (eQTL) example

Description

Simulated data set to mimic a small expression quantitative trait loci (eQTL) example, with p=150 single nucleotide polymorphisms (SNPs) as explanatory variables, s=10 gene expression features as response variables and data for n=100 observations. Loading the data will load the associated blockList object needed to fit the model with BayesSUR(). The R code for generating the simulated data is given in the Examples paragraph.

#importFrom BDgraph rgwish #importFrom gRbase mcsMAT #importFrom scrime simulateSNPs
Usage

exampleEQTL

Format

An object of class list of length 4.

Examples

# Load the eQTL sample dataset
data("exampleEQTL", package = "BayesSUR")
str(exampleEQTL)

    ## Write data file to the user’s directory by save()

    ## End(Not run)
Description

Preprocessed data set to mimic a small pharmacogenetic example from the Genomics of Drug Sensitivity in Cancer (GDSC) database, with p=850 gene features as explanatory variables, s=7 drugs sensitivity data as response variables and data for n=498 cell lines. Gene features include p1=343 gene expression features (GEX), p2=426 by copy number variations (CNV) and p3=68 mutated genes (MUT). Loading the data will load the associated blockList (and mrfG) objects needed to fit the model with BayesSUR(). The R code for generating the simulated data is given in the Examples paragraph.

Usage

e.exampleGDSC

Format

An object of class list of length 3.

Examples

# Load the GDSC sample dataset
data("exampleGDSC", package = "BayesSUR")
str(exampleGDSC)

## Not run:
#===============
# This code below is to do preprocessing of GDSC data and obtain the complete dataset
# "exampleGDSC.rda" above. The user needs load the datasets from
# https://www.cancerrxgene.org release 5.
# But downloading and transforming the three used datasets below to *.csv files first.

## Write data file exampleGDSC.rda to the user's directory by save()

## End(Not run)
getEstimator

description

Return the fitted response values that correspond to the posterior mean estimates from a BayesSUR class object.

Usage

## S3 method for class 'BayesSUR'
fitted(object, Pmax = 0, beta.type = "marginal", ...)

Arguments

object an object of class BayesSUR
Pmax valid if beta.type="conditional". If beta.type="conditional" and Pmax=0.5, it gives median probability model betas. Default is 0
beta.type type of estimated beta for the fitted model. Default is marginal, giving marginal beta estimation. If beta.type="conditional", it gives beta estimation conditional on gamma=1
... other arguments

Value

Fitted values extracted from an object of class BayesSUR. If the BayesSUR specified data standardization, the fitted values are base based on standardized data.

Examples

data("exampleEQTL", package = "BayesSUR")
hyperpar <- list( a_w = 2 , b_w = 5 )
set.seed(9173)
fit <- BayesSUR(Y = exampleEQTL["blockList"][[1]],
X = exampleEQTL["blockList"][[2]],
data = exampleEQTL["data"], outfilePath = tempdir(),
nIter = 100, burnin = 50, nChains = 2, gammaPrior = "hotspot",
hyperpar = hyperpar, tmpFolder = "tmp/"
)

## check fitted values
fitted.val <- fitted(fit)

---

getEstimator  

extract the posterior mean of the parameters

description

Extract the posterior mean of the parameters of a BayesSUR class object.
Usage

getEstimator(object, estimator = "gamma", Pmax = 0, beta.type = "marginal")

Arguments

object an object of class BayesSUR
estimator the name of one estimator. Default is the latent indicator estimator "gamma". Other options "beta", "Gy", "CPO" and "logP" correspond the marginal (conditional) coefficient matrix if beta.type="marginal"("conditional"), response graph and conditional predictive ordinate (CPO) respectively
Pmax threshold that truncate the estimator "gamma" or "Gy". Default is 0. If Pmax=0.5 and beta.type= "conditional", it gives median probability model betas
beta.type the type of output beta. Default is marginal, giving marginal beta estimation. If beta.type="conditional", it gives beta estimation conditional on gamma=1

Value

Return the estimator from an object of class BayesSUR. It is a matrix if the length of argument marginal is greater than 1. Otherwise, it is a list

Examples

data("exampleEQTL", package = "BayesSUR")
hyperpar <- list( a_w = 2 , b_w = 5 )

set.seed(9173)
fit <- BayesSUR(Y = exampleEQTL["blockList"][1],
X = exampleEQTL["blockList"][2],
data = exampleEQTL["data"], outFilePath = tempdir(),
nIter = 100, burnin = 50, nChains = 2, gammaPrior = "hotspot",
hyperpar = hyperpar, tmpFolder = "tmp/"
)

# extract the posterior mean of the coefficients matrix
beta_hat <- getEstimator(fit, estimator="beta")

plot.BayesSUR create a selection of plots for a BayesSUR class object

Description

plot method for class BayesSUR. This is the main plot function to be called by the user. This function calls one or several of the following functions: plotEstimator(), plotGraph(), plotMCMCdiag(), plotManhattan(), plotNetwork(), plotCPO().
Usage

## S3 method for class 'BayesSUR'
plot(x, estimator = NULL, type = NULL, ...)

Arguments

x an object of class BayesSUR

estimator It is in c(NULL, 'beta', 'gamma', 'Gy', 'logP', 'CPO') and works by combing with argument type.

- If estimator is in c("beta", "gamma", "Gy") and argument type="heatmap", it prints heatmaps of the specified estimator in estimator by a call to to function plotEstimator() for more other arguments.
- If estimator="Gy" and argument type="graph", it prints a structure graph of "Gy" by a call to function plotGraph() for more other arguments.
- If estimator=c("gamma","Gy") and argument type="network", it prints the estimated network between the response variables and predictors with nonzero coefficients by a call to function plotMCMCdiag() for more other arguments.
- If estimator=NULL (default) and type=NULL (default), it interactively prints the plots of estimators (i.e., beta, gamma and (or) Gy), response graph Gy, network, Manhattan and MCMC diagnostics.

... other arguments, see functions plotEstimator(), plotGraph(), plotNetwork(), plotManhattan(), plotMCMCdiag() or plotCPO()

Examples

data("exampleEQTL", package = "BayesSUR")
hyperpar = list( a_w = 2 , b_w = 5 )

set.seed(9173)
fit <- BayesSUR(Y = exampleEQTL[["blockList"]][[1]],
X = exampleEQTL[["blockList"]][[2]],
data = exampleEQTL[["data"]], outFilePath = tempdir(),
niter = 100, burnin = 0, nchains = 2, gammaPrior = "hotspot",
hyperpar = hyperpar, tmpFolder = "tmp/" )
## check output
## Not run:
# Show the interactive plots. Note that it needs at least 2000*(nbloc+1) iterations
# for the diagnostic plots where nbloc=3 by default
plot(fit)

## End(Not run)

## plot heatmaps of the estimated beta, gamma and Gy
plot(fit, estimator=c("beta", "gamma", "Gy"), type="heatmap")

## plot estimated graph of responses Gy
plot(fit, estimator="Gy", type="graph")

## plot network between response variables and associated predictors
plot(fit, estimator=c("gamma", "Gy"), type="network")

## print Manhattan-like plots
plot(fit, estimator="gamma", type="Manhattan")

## print MCMC diagnostic plots
plot(fit, estimator="logP", type="diagnostics")

---

**plotCPO**

*plot the conditional predictive ordinate*

### Description

Plot the conditional predictive ordinate (CPO) for each individual of a fitted model generated by `BayesSUR` which is a `BayesSUR` object. CPO is a handy posterior predictive check because it may be used to identify outliers, influential observations, and for hypothesis testing across different non-nested models (Gelfand 1996).

### Usage

```r
plotCPO(
  x,
  outlier.mark = TRUE,
  outlier.thresh = 0.01,
  scale.CPO = TRUE,
  x.loc = FALSE,
  axis.label = NULL,
  las = 0,
  cex.axis = 1,
  mark.pos = c(0, -0.01),
  mark.color = 2,
  mark.cex = 0.8,
)```
plotCPO

```r
xlab = "Observations",
ylab = NULL,
...
```

**Arguments**

- `x`: an object of class `BayesSUR`
- `outlier.mark`: mark the outliers with the response names. The default is `FALSE`
- `outlier.thresh`: threshold for the CPOs. The default is `0.01`.
- `scale.CPO`: scaled CPOs which is divided by their maximum. The default is `TRUE`
- `x.loc`: a vector of features distance
- `axis.label`: a vector of predictor names which are shown in CPO plot. The default is `NULL` only showing the indices. The value "auto" show the predictor names from the original data.
- `las`: graphical parameter of `plot.default`
- `cex.axis`: graphical parameter of `plot.default`
- `mark.pos`: the location of the marked text relative to the point
- `mark.color`: the color of the marked text. The default color is red
- `mark.cex`: the font size of the marked text. The default font size is `0.8`
- `xlab`: a title for the x axis
- `ylab`: a title for the y axis
- `...`: other arguments

**Details**

The default threshold for the CPOs to detect the outliers is 0.01 by Congdon (2005). It can be tuned by the argument `outlier.thresh`.

**References**

- Statisticat, LLC (2013). *Bayesian Inference*. Farmington, CT: Statisticat, LLC.

**Examples**

```r
data("exampleEQTL", package = "BayesSUR")
hyperpar <- list( a_w = 2 , b_w = 5 )
set.seed(9173)
fit <- BayesSUR(Y = exampleEQTL["blockList"][[1]],
```
```
X = exampleEQTL["blockList"][[2]],
data = exampleEQTL["data"], outFilePath = tempdir(),
nIter = 100, burnin = 50, nChains = 2, gammaPrior = "hotspot",
hyperpar = hyperpar, tmpFolder = "tmp/", output_CPO=TRUE)

## check output
# plot the conditional predictive ordinate (CPO)
plotCPO(fit)
```

---

**plotEstimator**  
*plot the estimators*

**Description**

Plot the posterior mean estimators from a BayesSUR class object, including the coefficients beta, latent indicator variable gamma and graph of responses.

**Usage**

```r
plotEstimator(
x,  
estimator = NULL,
colorScale.gamma = grey((100:0)/100),
colorScale.beta = c("blue", "white", "red"),
legend.cex.axis = 1,
name.responses = NA,
name.predictors = NA,
xlab = "",
ylab = "",
fig.tex = FALSE,
output = "ParamEstimator",
header = "",
header.cex = 2,
tick = FALSE,
mgp = c(2.5, 1, 0),
title.beta = NA,
title.gamma = NA,
title.Gy = NA,
cex.main = 1.5,
...)
```

**Arguments**

- `x`: an object of class BayesSUR
estimator  print the heatmap of estimators. The value "beta" is for the estimated coefficients matrix, "gamma" for the latent indicator matrix and "Gy" for the graph of responses

colorScale.gamma  value palette for gamma

colorScale.beta  a vector of three colors for diverging color schemes

legend.cex.axis  magnification of axis annotation relative to cex

name.responses  a vector of the response names. The default is "NA" only to show the locations. The value "auto" show the response names from the original data.

name.predictors  a vector of the predictor names. The default is "NA" only to show the locations. The value "auto" show the predictor names from the original data.

xlab  a title for the x axis

ylab  a title for the y axis

fig.tex  print the figure through LaTex. Default is "FALSE"

output  the file name of printed figure

header  the main title

header.cex  size of the main title for all estimators

tick  a logical value specifying whether tickmarks and an axis line should be drawn. Default is "FALSE"

mgp  the margin line (in mex units) for the axis title, axis labels and axis line

title.beta  a title for the printed "beta"

title.gamma  a title for the printed "gamma"

title.Gy  a title for the printed "Gy"

cex.main  size of the title for each estimator

...  other arguments

Examples

data("exampleEQTL", package = "BayesSUR")

hyperpar <- list( a_w = 2 , b_w = 5 )

set.seed(9173)

fit <- BayesSUR(Y = exampleEQTL[["blockList"]][[1]],
X = exampleEQTL[["blockList"]][[2]],
data = exampleEQTL[["data"]], outFilePath = tempdir(),
nIter = 100, burnin = 50, nChains = 2, gammaPrior = "hotspot",
hyperpar = hyperpar, tmpFolder = "tmp/"
)

## check output

# Plot the estimators from the fitted object

plotEstimator(fit, estimator=c("beta","gamma","Gy"))
## Not run:
#Set up temporary work directory for saving a pdf figure
td <- tempdir()
oldwd <- getwd()
setwd(td)

# Produce authentic math formulas in the graph
plotEstimator(fit, estimator=c("beta","gamma","Gy"), fig.tex = TRUE)

system(paste(getOption("pdfviewer"), "ParamEstimator.pdf"))

setwd(oldwd)

## End(Not run)

---

**plotGraph**

*plot the estimated graph for multiple response variables*

### Description

Plot the estimated graph for multiple response variables from a BayesSUR class object.

### Usage

```r
plotGraph(
  x, 
Pmax = 0.5, 
  main = "Estimated graph of responses", 
  edge.width = 2, 
  edge.weight = FALSE, 
  vertex.label = NULL, 
  vertex.label.color = "black", 
  vertex.size = 30, 
  vertex.color = "dodgerblue", 
  vertex.frame.color = NA, 
  ... 
)
```

### Arguments

- **x**: either an object of class BayesSUR (default) or a symmetric numeric matrix representing an adjacency matrix for a given graph structure. If x is an adjacency matrix, argument main="Given graph of responses" by default.
- **Pmax**: a value for thresholding the learning structure matrix of multiple response variables. Default is 0.5
- **main**: an overall title for the plot
- **edge.width**: edge width. Default is 2
edge.weight draw weighted edges after thresholding at 0.5. The default value FALSE is not to draw weighted edges
vertex.label character vector used to label the nodes
vertex.label.color label color. Default is "black"
vertex.size node size. Default is 30
vertex.color node color. Default is "dodgerblue"
vertex.frame.color node color. Default is "NA"
... other arguments

Examples

data("exampleEQTL", package = "BayesSUR")
hyperpar <- list( a_w = 2 , b_w = 5 )

set.seed(9173)
fit <- BayesSUR(Y = exampleEQTL["blockList"][[1]],
X = exampleEQTL["blockList"][[2]],
data = exampleEQTL["data"], outdirPath = tempdir(),
niter = 100, burnin = 50, nChains = 2, gammaPrior = "hotspot",
hyperpar = hyperpar, tmpFolder = "tmp/"
)

## check output
# show the graph relationship between responses
plotGraph(fit, estimator = "Gy")

plotManhattan

plot Manhattan-like plots for marginal posterior inclusion probabilities (mPIP) and numbers of responses of association for predictors

Description

Plot Manhattan-like plots for marginal posterior inclusion probabilities (mPIP) and numbers of responses of association for predictors of a "BayesSUR" class object.

Usage

plotManhattan(
  x,
  which = c(1, 2),
  x.loc = FALSE,
  axis.label = "auto",
  mark.responses = NULL,
  xlab1 = "Predictors",
  ylab1 = "mPIP",
...)

Arguments

xlab2 = "Predictors",
ylab2 = "No. of responses",
threshold = 0.5,
las = 0,
cex.axis = 1,
mark.pos = c(0, 0),
mark.color = 2,
mark.cex = 0.8,
header = "",
...
)

Arguments

x

an object of class BayesSUR

which

if it's value "1" showing the Manhattan-like plot of the marginal posterior inclusion probabilities (mPIP). If it's value "2" showing the Manhattan-like plot of the number of responses. The default is to show both figures.

x.loc

a vector of features distance

axis.label

a vector of predictor names which are shown in the Manhattan-like plot. The value "NULL" only showing the indices. The default "auto" show the predictor names from the original data.

mark.responses

a vector of response names which are shown in the Manhattan-like plot for the mPIP

xlab1

a title for the x axis of Manhattan-like plot for the mPIP

ylab1

a title for the y axis of Manhattan-like plot for the mPIP

xlab2

a title for the x axis of Manhattan-like plot for the numbers of responses

ylab2

a title for the y axis of Manhattan-like plot for the numbers of responses

threshold

threshold for showing number of response variables significantly associated with each feature

las

graphical parameter of plot.default

cex.axis

graphical parameter of plot.default

mark.pos

the location of the marked text relative to the point

mark.color

the color of the marked text. The default color is red.

mark.cex

the fontsize of the marked text. The default fontsize is 0.8.

header

the main title

... other arguments

Examples

data("exampleEQTL", package = "BayesSUR")
hyperpar <- list(a_w = 2, b_w = 5)
set.seed(9173)
fit <- BayesSUR(Y = exampleEQTL[["blockList"]][[1]],
X = exampleEQTL[["blockList"]][[2]],
data = exampleEQTL[["data"]], outfilePath = tempdir(),
nIter = 100, burnin = 50, nChains = 2, gammaPrior = "hotspot",
hyperpar = hyperpar, tmpFolder = "tmp/"
)

## check output
# show the Manhattan-like plots
plotManhattan(fit)

plotMCMCdiag(fit)

---

**plotMCMCdiag**

**plot MCMC diagnostic plots**

---

**Description**

Show trace plots and diagnostic density plots of a fitted model object of class "BayesSUR".

**Usage**

```r
plotMCMCdiag(x, nbloc = 3, HIWg = NULL, header = "", ...)  
```

**Arguments**

- `x` an object of class BayesSUR
- `nbloc` number of splits for the last half iterations after subtracting burn-in length
- `HIWg` diagnostic plot of the response graph. Default is NULL. HIW="degree" prints the diagnostic of the degrees of response nodes. HIW="edges" prints the diagnostic of every edge between two responses. HIW="lik" prints the diagnostic of the posterior likelihoods of the hyperparameters related to the response relationships
- `header` the main title
- `...` other arguments for the plots of the log-likelihood and model size

**Examples**

```r
data("exampleEQTL", package = "BayesSUR")
hyperpar <- list( a_w = 2 , b_w = 5 )

set.seed(9173)
fit <- BayesSUR(Y = exampleEQTL[["blockList"]][[1]],
X = exampleEQTL[["blockList"]][[2]],
data = exampleEQTL[["data"]], outfilePath = tempdir(),
nIter = 100, burnin = 50, nChains = 2, gammaPrior = "hotspot",
hyperpar = hyperpar, tmpFolder = "tmp/"
)

## check output
plotMCMCdiag(fit)
```
plotNetwork

plot the network representation of the associations between responses and predictors

Description

Plot the network representation of the associations between responses and predictors, based on the estimated gamma matrix and graph of responses from a "BayesSUR" class object.

Usage

plotNetwork(
  x,
  includeResponse = NULL,
  excludeResponse = NULL,
  includePredictor = NULL,
  excludePredictor = NULL,
  MatrixGamma = NULL,
  PmaxPredictor = 0.5,
  PmaxResponse = 0.5,
  nodesizePredictor = 2,
  nodesizeResponse = 15,
  no.isolates = FALSE,
  lineup = 1.2,
  gray.alpha = 0.6,
  edgewith.response = 5,
  edgewith.predictor = 2,
  edge.weight = FALSE,
  label.predictor = NULL,
  label.response = NULL,
  color.predictor = NULL,
  color.response = NULL,
  name.predictors = NULL,
  name.responses = NULL,
  vertex.frame.color = NA,
  layoutInCircle = FALSE,
  header = "",
  ...
)

Arguments

x
  an object of class BayesSUR
includeResponse
  A vector of the response names which are shown in the network
excludeResponse
  A vector of the response names which are not shown in the network
includePredictor
   A vector of the predictor names which are shown in the network

excludePredictor
   A vector of the predictor names which are not shown in the network

MatrixGamma
   A matrix or dataframe of the latent indicator variable. Default is NULL and to
   extrat it from object of class inheriting from an object of class "BayesSUR"

PmaxPredictor
   cutpoint for thresholding the estimated latent indicator variable. Default is 0.5

PmaxResponse
   cutpoint for thresholding the learning structure matrix of multiple response vari-
   ables. Default is 0.5

nodesizePredictor
   node size of Predictors in the output graph. Default is 15

nodesizeResponse
   node size of response variables in the output graph. Default is 25

no.isolates
   remove isolated nodes from responses graph and Full graph, may get problem if
   there are also isolated Predictors

lineup
   A ratio of the heights between responses’ area and Predictors’

gray.alpha
   the opacity. The default is 0.6

edgewith.response
   the edge width between response nodes

edgewith.predictor
   the edge width between the predictor and response node

edge.weight
   draw weighted edges after thresholding at 0.5. The defaul value FALSE is not to
   draw weighted edges

label.predictor
   A vector of the names of predictors

label.response
   A vector of the names of response variables

color.predictor
   color of the predictor nodes

color.response
   color of the response nodes

name.predictors
   A subtitle for the predictors

name.responses
   A subtitle for the responses

vertex.frame.color
   color of the frame of the vertices. If you don’t want vertices to have a frame,
   supply NA as the color name

layoutInCircle
   place vertices on a circle, in the order of their vertex ids. The default is FALSE

header
   the main title

... other arguments
Examples

data("exampleEQTL", package = "BayesSUR")
hyperpar <- list( a_w = 2, b_w = 5 )

## check output
# show the Network representation of the associations between responses and features
plotNetwork(fit)

### predict.BayesSUR

**Description**

Predict responses corresponding to the posterior mean of the coefficients, return posterior mean of coefficients or indices of nonzero coefficients of a BayesSUR class object.

**Usage**

```r
## S3 method for class 'BayesSUR'
predict(object, newx, type = "response", beta.type = "marginal", Pmax = 0, ...)
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>object</td>
<td>an object of class BayesSUR</td>
</tr>
<tr>
<td>newx</td>
<td>Matrix of new values for x at which predictions are to be made. Must be a matrix</td>
</tr>
<tr>
<td>type</td>
<td>Type of prediction required. type=&quot;response&quot; gives the fitted responses; type=&quot;coefficients&quot; returns the estimated coefficients depending on the arguments beta.type and Pmax. type=&quot;nonzero&quot; returns a list of the indices of the nonzero coefficients corresponding to the estimated latent indicator variable thresholding at Pmax</td>
</tr>
<tr>
<td>beta.type</td>
<td>the type of estimated coefficients beta for prediction. Default is marginal, giving marginal beta estimation. If beta.type=&quot;conditional&quot;, it gives conditional beta estimation</td>
</tr>
<tr>
<td>Pmax</td>
<td>If type=&quot;nonzero&quot;, it is a threshold for the estimated latent indicator variable. If type=&quot;coefficients&quot;, beta.type=&quot;conditional&quot; and Pmax=0.5, it gives median probability model betas. Default is 0</td>
</tr>
<tr>
<td>...</td>
<td>other arguments</td>
</tr>
</tbody>
</table>
Value

Predicted values extracted from an object of class BayesSUR. If the BayesSUR specified data standardization, the fitted values are base based on standardized data.

Examples

data("exampleEQTL", package = "BayesSUR")
hyperpar <- list(a_w = 2, b_w = 5)
set.seed(9173)
fit <- BayesSUR(Y = exampleEQTL["blockList"][[1]],
X = exampleEQTL["blockList"][[2]],
data = exampleEQTL["data"], outFilePath = tempdir(),
nIter = 100, burnin = 50, nChains = 2, gammaPrior = "hotspot",
hyperpar = hyperpar, tmpFolder = "tmp/")

## check prediction
predict.val <- predict(fit, newx=exampleEQTL["blockList"][[2]])

### S3 method for class 'BayesSUR'

print(x, Pmax = 0.5, ...)

Arguments

- **x**: an object of class BayesSUR
- **Pmax**: threshold that truncates the estimated coefficients based on thresholding the estimated latent indicator variable. Default is 0.5
- ... other arguments

Value

Return a short summary from an object of class BayesSUR, including the number of selected predictors with mPIP>Pmax and the expected log pointwise predictive density estimates (i.e., elpd.LOO and elpd.WAIC).
Examples

data("exampleEQTL", package = "BayesSUR")
hyperpar = list(a_w = 2, b_w = 5)

set.seed(9173)
fit <- BayesSUR(Y = exampleEQTL["blockList"][1],
X = exampleEQTL["blockList"][2],
data = exampleEQTL["data"], outfilePath = tempdir(),
nIter = 100, burnin = 50, nChains = 2, gammaPrior = "hotspot",
hyperpar = hyperpar, tmpFolder = "tmp/", output_CPO = TRUE)

## check output
# show the print information
print(fit)

summary.BayesSUR

summary method for class BayesSUR

Description

Summary method for class BayesSUR. It includes the argument matching information, Top predictors/responses on average mPIP across all responses/predictors, elpd estimates, MCMC specification, model specification and hyper-parameters. The summarized number of the selected variable corresponds to the posterior mean of the latent indicator variable thresholding at 0.5 by default.

Usage

## S3 method for class 'BayesSUR'
summary(object, Pmax = 0.5, ...)

Arguments

object an object of class BayesSUR
Pmax threshold that truncates the estimated coefficients based on thresholding the estimated latent indicator variable. Default is 0.5
... other arguments

Value

Return a result summary from an object of class BayesSUR, including the CPOs, number of selected predictors with mPIP>Pmax, top 10 predictors on average mPIP across all responses, top 10 responses on average mPIP across all predictors, Expected log pointwise predictive density (elpd) estimates, MCMC specification, model specification (i.e., covariance prior and gamma prior) and hyper-parameters.
**Examples**

```r
data(exampleEQTL, package = "BayesSUR")
hyperpar = list(a_w = 2, b_w = 5)

set.seed(9173)
fit <- BayesSUR(Y = exampleEQTL["blockList"][[1]],
               X = exampleEQTL["blockList"][[2]],
               data = exampleEQTL["data"], outFilePath = tempdir(),
               nIter = 100, burnin = 50, nChains = 2, gammaPrior = "hotspot",
               hyperpar = hyperpar, tmpFolder = "tmp/", output_CPO=TRUE)

## check output
# show the summary information
summary(fit)
```

**Description**

Indices list of target genes corresponding the example_GDSC data set. It has two components representing the gene indices of the MAPK/ERK pathway and BCR-ABL gene fusion in the example_GDSC data set.

**Usage**

targetGene

**Format**

An object of class list of length 2.

**Examples**

```r
# Load the indices of gene targets from the GDSC sample dataset
data("targetGene", package = "BayesSUR")
str(targetGene)

## Not run:
# ==============
# This code below is to do preprocessing of GDSC data and obtain the complete dataset
# "targetGene.rda" above. The user needs load the datasets from
# ftp://ftp.sanger.ac.uk/pub4/cancerrxgene/releases/release-5.0/.
# But downloading and transforming the three used datasets below to *.csv files first.
# ================
requireNamespace("plyr", quietly = TRUE)
requireNamespace("data.table", quietly = TRUE)
