Package ‘GPFDA’

January 29, 2021

Type Package
Title Gaussian Process for Functional Data Analysis
Version 3.1.1
Date 2021-01-29
Author Jian Qing Shi, Yafeng Cheng, Evandro Konzen
Maintainer Evandro Konzen <gpfda.r@gmail.com>
Description Functionalities for modelling functional data with multidimensional inputs, multivariate functional data, and non-separable and/or non-stationary covariance structure of function-valued processes. In addition, there are functionalities for functional regression models where the mean function depends on scalar and/or functional covariates and the covariance structure depends on functional covariates. The development version of the package can be found on <https://github.com/gpfda/GPFDA-dev>.
License GPL-3
Depends R (>= 3.6)
Imports Rcpp (>= 1.0.2), splines, mgcv, fields, interp, stats, graphics, grDevices, fda, fda.usc
LinkingTo Rcpp, RcppArmadillo

calcScaleDistMats  
*Calculate matrices for NSGP covariance function*

**Description**

Calculates matrices 'ScaleMat' and 'DistMat', which are used to obtain NSGP covariance matrices

**Usage**

`calcScaleDistMats(A_List, coords)`

**Arguments**

<table>
<thead>
<tr>
<th>A_List</th>
<th>List of anisotropy matrices</th>
</tr>
</thead>
<tbody>
<tr>
<td>coords</td>
<td>Matrix of input coordinates (covariates)</td>
</tr>
</tbody>
</table>
Value

A list of ScaleMat and DistMat matrices

Examples

```r
## See examples in vignette:
# vignette("nsgpr", package = "GPFDAt")
```

---

**co2**

- **co2**: data set for a real data example

---

Description

A data frame containing monthly CO2 data and annual average for each year. The original data has a sample size of 612, but the 5 of them which are missing was removed from our sample.

Usage

```r
co2
```

Format

A data frame with 13 columns (12 months and the annual average) and 51 rows (number of years).

Details

Data used in the real data example, see vignette("co2"). It is obtained from [https://cdiac.ess-dive.lbl.gov/ftp/trends/co2/maunaloa.co2](https://cdiac.ess-dive.lbl.gov/ftp/trends/co2/maunaloa.co2). Atmospheric CO2 values (ppmv) derived from in situ air samples collected at Mauna Loa, Hawaii, USA.

---

**covMat**

- **Calculate a covariance matrix**

Description

Evaluates one of the following covariance functions at input vectors \( t \) and \( t' \):

- Powered exponential
- Rational quadratic
- Matern
- Linear
Usage

cov.pow.ex(hyper, input, inputNew = NULL, gamma = 2)
cov.rat.qu(hyper, input, inputNew = NULL)
cov.matern(hyper, input, inputNew = NULL, nu)
cov.linear(hyper, input, inputNew = NULL)

Arguments

hyper The hyperparameters. It must be a list with certain names. See details.
input The covariate t. It must be either a matrix, where each column represents a
      covariate, or a vector if there is only one covariate.
inputNew The covariate t’. It also must be a vector or a matrix. If NULL (default), ‘in-
           putNew’ will be set to be equal to ‘input’ and the function will return a squared,
           symmetric covariance matrix.
gamma Power parameter used in powered exponential kernel function. It must be 0<gamma<=2.
      Default to 2, which gives the squared exponential covariance function.

nu Smoothness parameter of the Matern class. It must be a positive value.

Details

The names for the hyperparameters should be:

- "pow.ex.v" and "pow.ex.w" (powered exponential);
- "rat.qu.v", "rat.qu.w" and "rat.qu.a" (rational quadratic);
- "matern.v" and "matern.w" (Matern);
- "linear.i" and "linear.a" (linear);
- "vv" (Gaussian white noise).

Value

A covariance matrix

References

Press.
Description

Calculate the second derivative of the likelihood function with respect to one of the hyperparameters, given the first and second derivative of the kernel with respect to that hyperparameter.

Usage

D2(d1, d2, inv.Q, Alpha.Q)

Arguments

d1 First derivative of the kernel function with respect to the required hyperparameter.

d2 Second derivative of the kernel function with respect to the required hyperparameter.

inv.Q Inverse of covariance matrix Q.

Alpha.Q This is alpha * alpha’ - invQ, where invQ is the inverse of the covariance matrix Q, and alpha = invQ * Y, where Y is the response.

Details

The function calculates the second derivative of the log-likelihood, using the first and second derivative of the kernel functions.

Value

A number.

References

Examples

## This function is used in the vignette 'co2':
# vignette("co2", package = "GPFDA")
dataExampleGPFR

Data simulated in the GPFR example

Description

A list containing training and test data simulated from a functional regression model.

In the training set, there are $M=20$ independent realisations and the functional response and the functional covariate are observed on a grid of $n=20$ time points.

The test set includes a single realisation observed on a grid of $n_{\text{new}}=60$ time points.

Both training and test sets also have a scalar covariate.

Usage

dataExampleGPFR

Format

A list with seven elements:

- **tt** A vector of length 50
- **response_train** A (20 x 50) matrix
- **x_train** A (20 x 50) matrix
- **scalar_train** A (20 x 2) matrix
- **t_new** A vector of length 60
- **response_new** A vector of length 60
- **x_new** A vector of length 60
- **scalar_new** A (1 x 2) matrix

Details

Data used in the GPFR example, see vignette("gpfr").
dataExampleMGPR

Data simulated in the MGPR example

Description

A list containing data simulated from a MGPR model.

The dataset contains 30 realisations from a trivariate process. Each of the three functions is observed on 250 time points on \([0,1]\).

Usage

dataExampleMGPR

Format

A list with two elements:

- **input** List of 3 numeric vectors, each one being the time points where the corresponding function is observed.
- **response** List of 3 matrices containing the observed 250 datapoints. Each column is an independent realisation.

Details

Data used in the MGPR example, see vignette("mgpr").

distanceMatrix

Calculate generalised distances

Description

Calculate the generalised distance between vectors \(t\) and \(t'\) using an anisotropy matrix \(A\).

- **distMat** and **distMatSq** calculate:

\[
[(t - t')^{p/2}]^T A (t - t')^{p/2}
\]

- **distMatLinear** and **distMatLinearSq** calculate:

\[t^T A t'\]
Usage

distMat(input, inputNew, A, power)
distMatSq(input, A, power)
distMatLinear(input, inputNew, A)
distMatLinearSq(input, A)

Arguments

input Vector of the input coordinate t
inputNew Vector of the input coordinate t'
A Anisotropy matrix A
power Power value p

Details

The `distMatSq` and `distMatLinearSq` functions are used when input vectors t and t' are identical, returning a symmetric matrix.

When `distMat` and `distMatSq` functions are used in powered exponential kernels, power=1 gives the exponential kernel and power=2 gives the squared exponential one.

`distMatLinear` and `distMatLinearSq` functions are used in the linear covariance kernel.

Value

A matrix

---

**GPFDA**: A package for Gaussian Process Regression for Functional Data Analysis

**Description**

Gaussian Process Regression for Functional Data Analysis

**Details**

The main functions of the package are:

- **gpr** Gaussian process regression using stationary separable covariance kernels.
- **nsgpr** Gaussian process regression using nonstationary and/or nonseparable covariance kernels.
- **mgpr** Multivariate Gaussian process – regression for multivariate outputs.
**Description**

Use functional regression (FR) model for the mean structure and Gaussian Process (GP) for the covariance structure.

Let 'n' be the number of time points 't' of functional objects and 'nrep' the number of independent replications in the sample.

**Usage**

```r
gpfr(
  response,
  time = NULL,
  uReg = NULL,
  fxReg = NULL,
  fyList = NULL,
  uCoefList = NULL,
  fxList = NULL,
  concurrent = TRUE,
  fxCoefList = NULL,
  gpReg = NULL,
  hyper = NULL,
  NewHyper = NULL,
  Cov = "pow.ex",
  gamma = 2,
  nu = 1.5,
  useGradient = T,
  rel.tol = 1e-10,
  trace.iter = 5,
  fitting = FALSE
)
```
Arguments

response: Response data. It can be an 'fd' object or a matrix with 'nrep' rows and 'n' columns.

time: Input 't' of functional objects. It is a numeric vector of length 'n'.

uReg: Scalar covariates for the FR model. It should be a matrix with 'nrep' rows.

fxReg: Functional covariates for the FR model. It can be a matrix with 'nrep' rows and 'n' columns, an 'fd' object, or a list of matrices or 'fd' objects.

fyList: A list to control the smoothing of response.

uCoefList: A list to control the smoothing of the regression coefficient function of the scalar covariates in the FR model.

fxList: A list to control the smoothing of functional covariates in the FR model.

concurrent: Logical. If TRUE (default), concurrent functional regression will be carried out; otherwise, the full functional regression will be carried out.

fxCoefList: A list to control the smoothing of the regression coefficient function of functional covariates in the functional concurrent model.

gpReg: Covariates in the GP model. It should be a matrix, a numeric vector, an 'fd' object, a list of matrices or a list of 'fd' objects.

hyper: Vector of initial hyperparameters. Default to NULL.

NewHyper: Vector of names of new hyperparameters from the customized kernel function.

Cov: Covariance function(s) to use. Options are: 'linear', 'pow.ex', 'rat.qu', and 'matern'. Default to 'power.ex'.

gamma: Power parameter used in powered exponential kernel function. It must be 0<gamma<=2.

nu: Smoothness parameter of the Matern class. It must be a positive value.

useGradient: Logical. If TRUE, first derivatives will be used in the optimization.

rel.tol: Relative tolerance passed to nlminb(). Default to be 1e-10.

trace.iter: Print the processing of iterations of optimization.

fitting: Logical. If TRUE, fitting is carried out. Default to FALSE.

Details

fyList is a list with the following items:

- time: a sequence of time points; default to be 100 points from 0 to 1.
- nbasis: number of basis functions used in smoothing, default to be less than or equal to 23.
- norder: order of the functional curves; default to be 6.
- bSpline: logical. If TRUE (default), B-splines basis is used; otherwise, Fourier basis is used.
- Pen: default to be c(0,0), meaning that the penalty is only applied to the second order derivative of the curve, with no penalty for the zero-th and first order derivatives of the curve.
- lambda: smoothing parameter for the penalty, default to be 1e-4.
fxList is similar to fyList. However, it is a list of lists to allow for different specifications for each functional covariate if there are multiple ones.

uCoefList and fxCoefList are similar to each other. Each one is expected to be a list of lists. If a list of one element is provided, then the items of this element are applied to each of the functional coefficients of scalar covariates and of functional covariates, respectively.

- rtime: range of time, default to be c(0,1).
- nbasis: number of basis functions used in smoothing, default to be less than or equal to 19.
- norder: order of the functional curves; default to be 6.
- bSpline: logical. If TRUE (default), B-splines basis is used; otherwise, Fourier basis is used.
- Pen: default to be c(0,0).
- lambda: smoothing parameter for the penalty, default to be 1e4.
- bivar: logical. Used for non-concurrent models; if TRUE, bivariate basis will be used; if FALSE (default), normal basis will be used; see details in bifdPar.
- lambdas: smoothing parameter for the penalty of the additional basis, default to be 1.

Note that all items have default settings.

Value

A list containing:

- hyper Estimated hyperparameters
- I A vector of estimated standard deviation of hyperparameters
- modellist List of FR models fitted before Gaussian process
- CovFun Covariance function used
- gamma Parameter 'gamma' used in Gaussian process with powered exponential kernel
- nu Parameter 'nu' used in Gaussian process with Matern kernel
- init_resp Raw response data
- resid_resp Residual after the fitted values from FR models have been taken out
- fitted Fitted values
- fitted.sd Standard deviation of the fitted values
- ModelType The type of the model applied in the function.
- lTrain Training scalar covariates for the FR model
- fTrain Training functional covariates for the FR model
- mfTrainfd List of 'fd' objects from training data for FR model with functional covariates
- gpTrain Training data for Gaussian Process
- time Input time 't'
- iuuL Inverse of covariance matrix for uReg
- iuuF Inverse of covariance matrix for fxReg
- fittedFM Fitted values from the FR model
- fyList fyList object used
References

Examples

```r
## See examples in vignette:
# vignette("gpfr", package = "GPFDA")
```

**gpfrPredict**

Prediction of GPFR model

Description

Make predictions for test input data based on the GPFR model learnt by the `gpfr` function. Both Type I and Type II predictions can be made.

Usage

```r
gpfrPredict(
  train,
  testInputGP,
  testTime = NULL,
  uReg = NULL,
  fxReg = NULL,
  gpReg = NULL,
  GPpredict = TRUE
)
```

Arguments

- **train**: An object of class `gpfr` obtained by the `gpfr` function.
- **testInputGP**: Test input data for the GP prediction. It must be a numeric vector, a matrix or an `fd` object.
- **testTime**: Test time points for prediction. If NULL, default settings will be applied.
- **uReg**: Scalar covariates data of a new batch for the FR model.
- **fxReg**: Functional covariates data of a new batch for the FR model.
- **gpReg**: Input data for the GP part used for Type I prediction. It must be a list of three items. The names of the items must be 'response', 'input', and 'time'. The item 'response' is the observed response for a new batch; 'input' is the observed functional covariates for a new batch; 'time' is the observed time for the previous two. If NULL (default), Type II prediction is carried out.
- **GPpredict**: Logical. If TRUE (default), GPFR prediction is carried out; otherwise only predictions based on the FR model is carried out.
Details
If 'gpReg' is provided, then Type I prediction is made. Otherwise, Type II prediction is made.

Value
A list containing:

- **ypred.mean**  The mean values of the prediction.
- **ypred.sd**  The standard deviation of the predictions.
- **predictionType**  Prediction type if GPFR prediction is carried out.
- **train**  All items trained by 'gpfr'.

References

Examples
```r
## See examples in vignette:
# vignette("gpfr", package = "GPFDA")
```

---

**gpr**

*Gaussian process regression (GPR) model*

Description
Gaussian process regression for a single or multiple independent realisations.

Usage
```r
gpr(
    response,
    input,
    Cov = "pow.ex",
    m = NULL,
    hyper = NULL,
    NewHyper = NULL,
    meanModel = 0,
    mu = NULL,
    gamma = 2,
    nu = 1.5,
    useGradient = T,
    iter.max = 100,
)```
rel.tol = 8e-10,
trace = 0,
nInitCandidates = 1000
)

Arguments

response Response data. It should be a matrix, where each column is a realisation. It can be a vector if there is only one realisation.

input Input covariates. It must be either a matrix, where each column represents a covariate, or a vector if there is only one covariate.

Cov Covariance function(s) to use. Options are: 'linear', 'pow.ex', 'rat.qu', and 'matern'. Default to 'power.ex'.

m If Subset of Data is to be used, m denotes the subset size and cannot be larger than the total sample size. Default to NULL.

hyper The hyperparameters. Default to NULL. If not NULL, then it must be a list with appropriate names.

NewHyper Vector of names of the new hyperparameters of the customized kernel function. These names must have the format: xxxxxx.x, i.e. '6 digit' followed by 'a dot' followed by '1 digit'. This is required for both 'hyper' and 'NewHyper'

meanModel Type of mean function. It can be

0 Zero mean function
1 Constant mean function to be estimated
't' Linear model for the mean function
'avg' The average across replications is used as the mean function. This is only used if there are more than two realisations observed at the same input coordinate values.

Default to 0. If argument 'mu' is specified, then 'meanModel' will be set to 'userDefined'.

mu Mean function specified by the user. It must be a vector. Its length must be the same as the sample size, that is, nrow(response).

gamma Power parameter used in powered exponential kernel function. It must be 0<gamma<=2.

nu Smoothness parameter of the Matern class. It must be a positive value.

useGradient Logical. If TRUE, first derivatives will be used in the optimization.

iter.max Maximum number of iterations allowed. Default to 100. If 'rel.tol' is reduced, then the number of iterations needed will be less.

rel.tol Relative convergence tolerance. Default to 8e-10. Smaller rel.tol means higher accuracy and more time to converge.

trace The value of the objective function and the parameters is printed every trace’th iteration. Defaults to 0 which indicates no trace information is to be printed.

nInitCandidates Number of initial hyperparameter vectors. The optimization starts with the best.
Details

The most important function of the package. It fits the GPR model and stores everything necessary for prediction. The optimization used in the function is 'nlminb'. The names for the hyperparameters should be: "linear.a" for linear covariance function, "pow.ex.w", "pow.ex.v" for power exponential, "rat.qu.s", "rat.qu.a" for rational quadratic, "matern.w", "matern.v" for Matern, "vv" for variance of Gaussian white noise. All hyperparameters should be in one list.

Value

A list containing:

- **hyper** Hyperparameters vector estimated from training data
- **var.hyper** Variance of the estimated hyperparameters
- **fitted.mean** Fitted values for the training data
- **fitted.sd** Standard deviation of the fitted values for the training data
- **train.x** Training covariates
- **train.y** Training response
- **train.yOri** Original training response
- **train.DataOri** Original training covariates
- **idxSubset** Index vector identifying which observations were selected if Subset of Data was used.
- **CovFun** Covariance function type
- **gamma** Parameter used in powered exponential covariance function
- **nu** Parameter used in Matern covariance function
- **Q** Covariance matrix
- **mean** Mean function
- **meanModel** Mean model used
- **meanLinearModel** 'lm' object if mean is a linear regression. NULL otherwise.
- **conv** An integer. 0 means converge; 1 otherwise.
- **hyper0** Starting point of the hyperparameters vector.

References

Examples

```r
## See examples in vignettes:
# vignette("gpr_ex1", package = "GPFDA")
# vignette("gpr_ex2", package = "GPFDA")
# vignette("co2", package = "GPFDA")
```
gprPredict

Prediction of GPR model

Description

Prediction of GPR model

Usage

gprPredict(
  train = NULL,
  inputNew = NULL,
  noiseFreePred = F,
  hyper = NULL,
  input = NULL,
  Y = NULL,
  mSR = NULL,
  Cov = NULL,
  gamma = NULL,
  nu = NULL,
  meanModel = 0,
  mu = 0
)

Arguments

- **train**: A 'gpr' object obtained from 'gpr' function. Default to NULL. If NULL, learning is done based on the other given arguments; otherwise, prediction is made based on the trained model of class gpr'.
- **inputNew**: Test input covariates. It must be either a matrix, where each column represents a covariate, or a vector if there is only one covariate.
- **noiseFreePred**: Logical. If TRUE, predictions will be noise-free.
- **hyper**: The hyperparameters. Default to NULL. If not NULL, then it must be a list with appropriate names.
- **input**: Input covariates. It must be either a matrix, where each column represents a covariate, or a vector if there is only one covariate.
- **Y**: Training response. It should be a matrix, where each column is a realisation. It can be a vector if there is only one realisation.
- **mSR**: Subset size m if Subset of Regressors method is used for prediction. It must be smaller than the total sample size.
- **Cov**: Covariance function(s) to use. Options are: 'linear', 'pow.ex', 'rat.qu', and 'matern'. Default to 'pow.ex'.
- **gamma**: Power parameter used in powered exponential kernel function. It must be 0<gamma<=2.
- **nu**: Smoothness parameter of the Matern class. It must be a positive value.
meanModel  Type of mean function. It can be
  0  Zero mean function
  1  Constant mean function to be estimated
     't'  Linear model for the mean function
     'avg' The average across replications is used as the mean function. This is
           only used if there are more than two realisations observed at the same input
           coordinate values.

Default to 0. If argument 'mu' is specified, then 'meanModel' will be set to
'userDefined'.

mu  Mean function specified by the user. It must be a vector. Its length must be the
     same as the sample size, that is, nrow(response).

Value

A list containing

   pred.mean  Mean of predictions
   pred.sd  Standard deviation of predictions
   newdata  Test input data
   noiseFreePred  Logical. If TRUE, predictions are noise-free.
   ...  Objects of 'gpr' class.

Examples

   ## See examples in vignettes:
   
   # vignette("gpr_ex1", package = "GPFDA")
   # vignette("gpr_ex2", package = "GPFDA")
   # vignette("co2", package = "GPFDA")
Arguments

mat
Input data, should be a matrix with ncol time points and nrow replications or samples.

fdList
A list with following items:

  time Sequence of time points (default to be 100 points from 0 to 1).
  nbasis Number of basis functions used in smoothing, default to be less or equal to 23.
  norder Order of the functional curves default to be 6.
  bSpline Logical, if TRUE (default), b-Spline basis is used; otherwise, Fourier basis is used.
  Pen Default to be c(0,0), meaning that the penalty is on the second order derivative of the curve, since the weight for zero-th and first order derivatives of the curve are set to zero.
  lambda Smoothing parameter for the penalty. Default to be 1e-4.

Details

All items listed above have default values. If any item is required to change, add that item into the list; otherwise, leave it as NULL. For example, if one only wants to change the number of basis functions, do:

```
mat2fd(SomeMatrix, list(nbasis=21))
```

Value

An 'fd' object

References

Examples

```
require(fda)
require(fda.usc)
nrep <- 20  # number of replications
n <- 100    # number of time points
input <- seq(-1, pi, length.out=n)  # time points
ry <- rnorm(nrep, sd=10)
y <- matrix(NA, ncol=n, nrow=nrep)
for(i in 1:nrep) y[i,] <- sin(2*input)*ry[i]
plot.fdata(fdata(y,input))

yfd <- mat2fd(y, list(lambda=0.01))
plot(yfd)

yfd <- mat2fd(y, list(lambda=0.00001))
plot(yfd)
```
mgpCovMat

Calculate a multivariate Gaussian processes covariance matrix given a vector of hyperparameters

Description

Calculate a multivariate Gaussian processes covariance matrix given a vector of hyperparameters

Usage

mgpCovMat(Data, hp)

Arguments

Data

List of two elements: ‘input’ and ‘response’. The element ‘input’ is a list of N vectors, where each vector represents the input covariate values for a particular output. The element ‘response’ is the corresponding list of N matrices (if there are multiple realisations) or vectors (for a single realisation) representing the response variables.

hp

Vector of hyperparameters

Value

Covariance matrix

References

Examples

## See examples in vignette:
# vignette("mgpr", package = "GPFDA")

mgpr

Multivariate Gaussian process regression (MGPR) model

Description

Multivariate Gaussian process regression where each of the N outputs is unidimensional. The multivariate output is allowed to have multiple independent realisations.

Usage

mgpr(Data, m = NULL, meanModel = 0, mu = NULL)
Arguments

Data List of two elements: 'input' and 'response'. The element 'input' is a list of N vectors, where each vector represents the input covariate values for a particular output. The element 'response' is the corresponding list of N matrices (if there are multiple realisations) or vectors (for a single realisation) representing the response variables.

m If Subset of Data is to be used in the estimation, m denotes the subset size. It cannot be larger than the total sample size. Default to NULL (Subsetting is not used).

meanModel Type of mean function applied to all outputs. It can be

0 Zero mean function for each output.

1 Constant mean function to be estimated for each output.

't' Linear model for the mean function of each output.

'avg' The average across replications is used as the mean function of each output. This can only be used if there are more than two realisations observed at the same input values.

Default to 0. If argument 'mu' is specified, then 'meanModel' will be set to 'userDefined'.

mu Vector of concatenated mean function values defined by the user. Default to NULL.

Value

A list containing:

- fitted.mean Fitted values for the training data
- fitted.sd Standard deviation of the fitted values for training data
- N Number of response variables
- X Original input variables
- Y Original response
- idx Index vector identifying to which output the elements of concatenated vectors correspond to.
- Cov Covariance matrix
- mean Concatenated mean function
- meanModel Mean model used for each output
- meanLinearModel 'lm' object for each output if the linear regression model is used for the mean functions. NULL otherwise.

References

Examples

# vignette("mgpr", package = "GPFDA")
Description
Prediction of MGPR model

Usage
mgprPredict(
  train,
  DataObs = NULL,
  DataNew,
  noiseFreePred = F,
  meanModel = NULL,
  mu = 0
)

Arguments
  train A 'mgpr' object obtained from 'mgpr' function. If NULL, predictions are made based on DataObs informed by the user.
  DataObs List of observed data. Default to NULL. If NULL, predictions are made based on the trained data (included in the object of class 'mgpr') used for learning.
  DataNew List of test input data.
  noiseFreePred Logical. If TRUE, predictions will be noise-free.
  meanModel Type of mean function applied to all outputs. It can be
    0 Zero mean function for each output.
    1 Constant mean function to be estimated for each output.
    't' Linear model for the mean function of each output.
    'avg' The average across replications is used as the mean function of each output. This can only be used if there are more than two realisations observed at the same input values.
    Default to 0. If argument 'mu' is specified, then 'meanModel' will be set to 'userDefined'.
  mu Vector of concatenated mean function values defined by the user. Default to NULL.

Value
A list containing
  pred.mean Mean of predictions for the test set.
  pred.sd Standard deviation of predictions for the test set.
  noiseFreePred Logical. If TRUE, predictions are noise-free.

### nsgpCovMat

*Calculate a NSGP covariance matrix given a vector of hyperparameters*

#### Description

Calculate a NSGP covariance matrix given a vector of hyperparameters

#### Usage

```r
nsgpCovMat(
  hp, input, inputSubsetIdx = NULL, nBasis = 5, corrModel = corrModel, gamma = NULL, nu = NULL, cyclic = NULL, whichTau = NULL, calcCov = T)
```

#### Arguments

- `hp`: Vector of hyperparameters estimated by function `nsgpr`.
- `input`: List of Q input variables (see Details).
- `inputSubsetIdx`: A list identifying a subset of the input values to be used in the estimation (see Details).
- `nBasis`: Number of B-spline basis functions in each coordinate direction along which parameters change.
- `corrModel`: Correlation function specification used for `g(.)`. It can be either "pow.ex" or "matern".
- `gamma`: Power parameter used in powered exponential kernel function. It must be 0<\(\gamma\)\leq 2.
- `nu`: Smoothness parameter of the Matern class. It must be a positive value.
- `cyclic`: Logical vector of dimension Q which defines which covariates are cyclic (periodic). For example, if basis functions should be cyclic only in the first coordinate direction, then cyclic=c(T,F). cyclic must have the same dimension of whichTau. If cyclic is TRUE for some coordinate direction, then cyclic B-spline functions will be used and the varying parameters (and their first two derivatives) will match at the boundaries of that coordinate direction.
whichTau Logical vector of dimension Q identifying which input coordinates the parameters are function of. For example, if Q=2 and parameters change only with respect to the first coordinate, then we set whichTau=c(T,F).

calcCov Logical. Calculate covariance matrix or not. If FALSE, time or spatially-varying parameters are still provided.

Value
A list containing

\textbf{Cov} Covariance matrix

\textbf{vareps} Noise variance

\textbf{As\_perTau} List of varying anisotropy matrix over the input space

\textbf{sig2\_perTau} Vector of signal variance over the input space

References

Examples

```r
## See examples in vignette:
# vignette("nsgpr", package = "GPFDAnsgpCovMatAsym
Calculate an asymmetric NSGP covariance matrix

Description
Calculate an asymmetric NSGP covariance matrix

Usage
nsgpCovMatAsym(hp, input, inputNew, nBasis = 5, corrModel = corrModel, gamma = NULL, nu = NULL, cyclic = NULL, whichTau = NULL)```
Arguments

- **hp**: Vector of hyperparameters estimated by function nsgpr.
- **input**: List of Q input variables (see Details).
- **inputNew**: List of Q test set input variables.
- **nBasis**: Number of B-spline basis functions in each coordinate direction along which parameters change.
- **corrModel**: Correlation function specification used for g(.). It can be either "pow.ex" or "matern".
- **gamma**: Power parameter used in powered exponential kernel function. It must be 0<gamma<=2.
- **nu**: Smoothness parameter of the Matern class. It must be a positive value.
- **cyclic**: Logical vector of dimension Q which defines which covariates are cyclic (periodic). For example, if basis functions should be cyclic only in the first coordinate direction, then cyclic=c(T,F). cyclic must have the same dimension of whichTau. If cyclic is TRUE for some coordinate direction, then cyclic B-spline functions will be used and the varying parameters (and their first two derivatives) will match at the boundaries of that coordinate direction.
- **whichTau**: Logical vector of dimension Q identifying which input coordinates the parameters are function of. For example, if Q=2 and parameters change only with respect to the first coordinate, then we set whichTau=c(T,F).

Value

An asymmetric covariance matrix

References

nsgpr

Estimation of a nonseparable and/or nonstationary covariance structure (NSGPR model)

Description

Estimate the covariance structure of a zero-mean Gaussian Process with Q-dimensional input coordinates (covariates).

Multiple realisations for the response variable can be used, provided they are observed on the same grid of dimension n_1 x n_2 x ... x n_Q.

Let n = n_1 x n_2 x ... x n_Q and let nSamples be the number of realisations.
Usage

nsgpr(
    response,
    input,
    corrModel = "pow.ex",
    gamma = 2,
    nu = 1.5,
    whichTau = NULL,
    nBasis = 5,
    cyclic = NULL,
    unitSignalVariance = F,
    zeroNoiseVariance = F,
    sepCov = F,
    nInitCandidates = 300,
    absBounds = 6,
    inputSubsetIdx = NULL
)

Arguments

response  Response variable. This should be a (n x nSamples) matrix where each column is a realisation
input      List of Q input variables (see Details). It can be either "pow.ex" or "matern".
corrModel Correlation function specification used for g(.). It can be either "pow.ex" or "matern".
gamma     Power parameter used in powered exponential kernel function. It must be 0<gamma<=2.
nu         Smoothness parameter of the Matern class. It must be a positive value.
whichTau  Logical vector of dimension Q identifying which input coordinates the parameters are function of. For example, if Q=2 and parameters change only with respect to the first coordinate, then we set whichTau=c(T,F).
nBasis     Number of B-spline basis functions in each coordinate direction along which parameters change.
cyclic     Logical vector of dimension Q which defines which covariates are cyclic (periodic). For example, if basis functions should be cyclic only in the first coordinate direction, then cyclic=c(T,F). cyclic must have the same dimension of whichTau. If cyclic is TRUE for some coordinate direction, then cyclic B-spline functions will be used and the varying parameters (and their first two derivatives) will match at the boundaries of that coordinate direction.
unitSignalVariance Logical. TRUE if we assume realisations have variance 1. This is useful when we want to estimate an NSGP correlation function.
zeroNoiseVariance Logical. TRUE if we assume the realisations are noise-free.
sepCov     Logical. TRUE only if we fix to zero all off-diagonal elements of the varying anisotropy matrix. Default to FALSE, allowing for a separable covariance function.
nInitCandidates  
number of initial hyperparameter vectors which are used to evaluate the log-likelihood function at a first step. After evaluating the log-likelihood using these 'nInitCandidates' vectors, the optimisation via nlminb() begins with the best of these vectors.

absBounds  
lower and upper boundaries for B-spline coefficients (if wanted).

inputSubsetIdx  
A list identifying a subset of the input values to be used in the estimation (see Details).

Details

The input argument for Q=2 can be constructed as follows:

```r
n1 <- 10
n2 <- 1000
input <- list()
input[[1]] <- seq(0,1,length.out = n1)
input[[2]] <- seq(0,1,length.out = n2)
```

If we want to use every third lattice point in the second input variable (using Subset of Data), then we can set

```r
inputSubsetIdx <- list()
inputSubsetIdx[[1]] <- 1:n1
inputSubsetIdx[[2]] <- seq(1,n2, by=3)
```

Value

A list containing:

- **MLEsts**  Maximum likelihood estimates of B-spline coefficients and noise variance.
- **response** Matrix of response.
- **inputMat**  Input coordinates in a matrix form
- **corrModel** Correlation function specification used for g(.)

References

Examples

```r
## See examples in vignette:
# vignette("nsgpr", package = "GPFDA")
```
Prediction of NSGPR model

Usage

```r
nsgprPredict(
  hp,
  response,
  input,
  inputNew,
  noiseFreePred = F,
  nBasis = nBasis,
  corrModel = corrModel,
  gamma = gamma,
  nu = nu,
  cyclic = cyclic,
  whichTau = whichTau
)
```

Arguments

- `hp`: Vector of hyperparameters estimated by function nsgpr.
- `response`: Response variable. This should be a (n x nSamples) matrix where each column is a realisation.
- `input`: List of Q input variables (see Details).
- `inputNew`: List of Q test set input variables.
- `noiseFreePred`: Logical. If TRUE, predictions will be noise-free.
- `nBasis`: Number of B-spline basis functions in each coordinate direction along which parameters change.
- `corrModel`: Correlation function specification used for g(.). It can be either "pow.ex" or "matern".
- `gamma`: Power parameter used in powered exponential kernel function. It must be 0<gamma<=2.
- `nu`: Smoothness parameter of the Matern class. It must be a positive value.
- `cyclic`: Logical vector of dimension Q which defines which covariates are cyclic (periodic). For example, if basis functions should be cyclic only in the first coordinate direction, then cyclic=c(T,F). cyclic must have the same dimension of whichTau. If cyclic is TRUE for some coordinate direction, then cyclic B-spline functions will be used and the varying parameters (and their first two derivatives) will match at the boundaries of that coordinate direction.
- `whichTau`: Logical vector of dimension Q identifying which input coordinates the parameters are function of. For example, if Q=2 and parameters change only with respect to the first coordinate, then we set whichTau=c(T,F).
plot.gpfr

Value

A list containing

- **pred.mean**  Mean of predictions for the test set.
- **pred.sd**  Standard deviation of predictions for the test set.
- **noiseFreePred**  Logical. If TRUE, predictions are noise-free.

References

Examples

```r
## See examples in vignette:
# vignette("nsgpr", package = "GPFDA")
```

---

**plot.gpfr**  
*Plot GPFR model for either training or prediction*

---

Description

Plot GPFR model for either training or prediction

Usage

```r
## S3 method for class 'gpfr'
plot(x,
     type = c("raw", "meanFunction", "fitted", "prediction"),
     ylab = "y",
     xlab = "t",
     ylim = NULL,
     realisations = NULL,
     alpha = 0.05,
     colourTrain = 2,
     colourNew = 4,
     mar = c(4.5, 5.1, 2.2, 0.8),
     oma = c(0, 0, 1, 0),
     cex.lab = 1.5,
     cex.axis = 1,
     cex.main = 1.5,
     ...)
```

**plot.gpr**

Plot Gaussian process for a given object of class `’gpr’`.

**Arguments**

- **x**
  Plot GPFR for training or prediction from a given object of `’gpr’` class.

- **type**
  Required type of plots. Options are: `’raw’`, `’meanFunction’`, `’fitted’` and `’prediction’`.

- **ylab**
  Title for the y axis.

- **xlab**
  Title for the x axis.

- **ylim**
  Graphical parameter. If NULL (default), it is chosen automatically.

- **realisations**
  Index vector identifying which training realisations should be plotted. If NULL (default), all training realisations are plotted. For predictions, `’realisations’` should be `’0’` if no training realisation is to be plotted.

- **alpha**
  Significance level used for `’fitted’` or `’prediction’`. Default is 0.05.

- **colourTrain**
  Colour for training realisations when `’type’` is set to `’prediction’` and `’realisations’` is positive.

- **colourNew**
  Colour for predictive mean for the new curve when `’type’` is set to `’prediction’`.

- **mar**
  Graphical parameter passed to `par()`.

- **oma**
  Graphical parameter passed to `par()`.

- **cex.lab**
  Graphical parameter passed to `par()`.

- **cex.axis**
  Graphical parameter passed to `par()`.

- **cex.main**
  Graphical parameter passed to `par()`.

- **...**
  Other graphical parameters passed to `plot()`.

**Value**

A plot.

**Examples**

```r
## See examples in vignette:
# vignette("gpfr", package = "GPFDA")
```

---

**plot.gpr**

Plot GPR model for either training or prediction

**Description**

Plot Gaussian process for a given object of class `’gpr’`. 
Usage

```r
## S3 method for class 'gpr'
plot(
x, 
fitted = F,
col.no = 1,
ylim = NULL,
realisation = NULL,
main = NULL,
cex.points = NULL,
lwd.points = NULL,
pch = NULL,
lwd = NULL,
...
)
```

Arguments

- `x`: The `gpr` object from either training or predicting of the Gaussian Process.
- `fitted`: Logical. Plot fitted values or not. Default to FALSE. If FALSE, plot the predictions.
- `col.no`: Column number of the input matrix. If the input matrix has more than one columns, than one of them will be used in the plot. Default to be the first one.
- `ylim`: Range value for y-axis.
- `realisation`: Integer identifying which realisation should be plotted (if there are multiple).
- `main`: Title for the plot
- `cex.points`: Graphical parameter
- `lwd.points`: Graphical parameter
- `pch`: Graphical parameter
- `lwd`: Graphical parameter
- `...`: Graphical parameters passed to plot().

Value

A plot

Examples

```r
## See examples in vignette:
# vignette("gpr_ex1", package = "GPFDA")
```
**plot.mgpr**  
*Plot predictions of GPR model*

---

**Description**

Plot predictions of each element of the multivariate Gaussian Process for a given an object of class 'mgpr'.

**Usage**

```r  
## S3 method for class 'mgpr'
plot(
  x,  
  DataObs,  
  DataNew,  
  realisation,  
  alpha = 0.05,  
  ylim = NULL,  
  mfrow = NULL,  
  cex = 2,  
  mar = c(4.5, 7.1, 0.2, 0.8),  
  oma = c(0, 0, 0, 0),  
  cex.lab = 2,  
  cex.axis = 1.5,  
  ...  
)  
```

**Arguments**

- `x`  
  An object of class 'mgpr'.

- `DataObs`  
  List of observed data.

- `DataNew`  
  List of test data.

- `realisation`  
  Index identifying which realisation should be plotted.

- `alpha`  
  Significance level used for MGPR predictions. Default is 0.05.

- `ylim`  
  Range of y-axis.

- `mfrow`  
  Graphical parameter.

- `cex`  
  Graphical parameter.

- `mar`  
  Graphical parameter passed to `par()`.

- `oma`  
  Graphical parameter passed to `par()`.

- `cex.lab`  
  Graphical parameter passed to `par()`.

- `cex.axis`  
  Graphical parameter passed to `par()`.

- `...`  
  Graphical parameters passed to `plot()`.
Value
A plot showing predictions of each element of the multivariate process.

Examples

```r
## See examples in vignette:
# vignette("mgpr", package = "GPFDA")
```

---

**plotImage**

*Draw an image plot for a given two-dimensional input*

---

Description

Draw an image plot for a given two-dimensional input

Usage

```r
plotImage(
  response, 
  input, 
  realisation = 1, 
  n1, 
  n2, 
  main = "", 
  zlim = NULL, 
  cex.axis = 1, 
  cex.lab = 2.5, 
  legend.cex.axis = 1, 
  font.main = 2, 
  cex.main = 2, 
  legend.width = 2, 
  mar = c(2.1, 2.1, 3.1, 6.1), 
  oma = c(0, 1, 0, 0), 
  nGrid = 200, 
  enlarge_zlim = NULL
)
```

Arguments

- `response` Data to be plotted (e.g. matrix of predictions)
- `input` Matrix of two columns representing the input coordinates.
- `realisation` Integer identifying which realisation should be plotted (if there are multiple).
- `n1` Number of datapoints in the first coordinate direction
- `n2` Number of datapoints in the second coordinate direction
- `main` Title for the plot
plotmgpCovFun

plotmgpCovFun

plotmgpCovFun( type = "Cov", output, outputp, Data, hp, idx, ylim = NULL, xlim = NULL, mar = c(4.5, 5.1, 2.2, 0.8), oma = c(0, 0, 0, 0), cex.lab = 1.5, cex.axis = 1, cex.main = 1.5 )

Value

A plot

Examples

## See examples in vignette:
# vignette("gpr_ex2", package = "GPFDA")

Description

Plot auto- or cross-covariance function of a multivariate Gaussian process

Usage

plotmgpCovFun( type = "Cov", output, outputp, Data, hp, idx, ylim = NULL, xlim = NULL, mar = c(4.5, 5.1, 2.2, 0.8), oma = c(0, 0, 0, 0), cex.lab = 1.5, cex.axis = 1, cex.main = 1.5 )

zlim Range of z-axis
cex.axis Graphical parameter
cex.lab Graphical parameter
legend.cex.axis Graphical parameter
font.main Graphical parameter
cex.main Graphical parameter
legend.width Graphical parameter
mar Graphical parameter
oma Graphical parameter
nGrid Dimension of output grid in each coordinate direction
enlarge_zlim Additional quantity to increase the range of zlim
Arguments

- **type** Logical. It can be either 'Cov' (for covariance function) or 'Cor' (for corresponding correlation function).
- **output** Integer identifying one element of the multivariate process.
- **outputp** Integer identifying one element of the multivariate process. If 'output' and 'outputp' are the same, the auto-covariance function will be plotted. Otherwise, the cross-covariance function between 'output' and 'outputp' will be plotted.

Data

- **List of two elements: 'input' and 'response'.** The element 'input' is a list of N vectors, where each vector represents the input covariate values for a particular output. The element 'response' is the corresponding list of N matrices (if there are multiple realisations) or vectors (for a single realisation) representing the response variables.
- **hp** Vector of hyperparameters
- **idx** Index vector identifying to which output the elements of concatenated vectors correspond to.
- **ylim** Graphical parameter
- **xlim** Graphical parameter
- **mar** Graphical parameter passed to par().
- **oma** Graphical parameter passed to par().
- **cex.lab** Graphical parameter passed to par().
- **cex.axis** Graphical parameter passed to par().
- **cex.main** Graphical parameter passed to par().

Value

A plot

Examples

```r
## See examples in vignette:
# vignette("mgpr", package = "GPFDA")
```

unscaledCorr **Calculate an unscaled NSGP correlation matrix**

Description

Calculate an unscaled NSGP correlation matrix

Usage

```r
unscaledCorr(Dist.mat, corrModel, gamma = NULL, nu = NULL)
```
Arguments

- **Dist.mat**: Distance matrix
- **corrModel**: Correlation function specification used for \( g(.) \). It can be either "pow.ex" or "matern".
- **gamma**: Power parameter used in powered exponential kernel function. It must be \( 0 < \gamma \leq 2 \).
- **nu**: Smoothness parameter of the Matern class. It must be a positive value.

Value

A matrix

References

Examples

```r
