

# Package ‘SteppedPower’

February 4, 2021

**Type** Package

**Title** Power Calculation for Stepped Wedge Designs

**Version** 0.1.0

**Description** Tools for power and sample size calculation as well as design diagnostics for longitudinal mixed model settings, with a focus on stepped wedge designs. All calculations are oracle estimates i.e. assume random effect variances to be known (or guessed) in advance. The method is introduced in Hussey and Hughes (2007) <doi:10.1016/j.cct.2006.05.007>, extensions are discussed in Li et al. (2020) <doi:10.1177/0962280220932962>.

**Imports** Matrix, plotly, grDevices, stats, utils

**Suggests** knitr, rmarkdown, testthat, swCRTdesign, pwr

**License** MIT + file LICENSE

**Encoding** UTF-8

**LazyData** true

**RoxygenNote** 7.1.1

**VignetteBuilder** knitr

**NeedsCompilation** no

**Author** Philipp Mildenerger [aut, cre]  
(<<https://orcid.org/0000-0002-7367-1708>>),  
Federico Marini [ctb] (<<https://orcid.org/0000-0003-3252-7758>>)

**Maintainer** Philipp Mildenerger <[pmildenb@uni-mainz.de](mailto:pmildenb@uni-mainz.de)>

**Repository** CRAN

## Index 19

---

compute_wlsPower	<i>Compute Power via weighted least squares</i>
------------------	---

---

## Description

This function calls ‘construct\_DesMat’ and ‘construct\_CovMat’ to construct the design and covariance matrix, respectively. These matrices are used to calculate the variance of the treatment effect estimator which is then used to calculate the power to detect the assumed treatment effect.

## Usage

```
compute_wlsPower(
  DesMat,
  EffSize,
  sigma,
  tau = 0,
  eta = NULL,
  tauAR = NULL,
  etaAR = NULL,
  rho = NULL,
  gamma = NULL,
  psi = NULL,
  N = NULL,
  CovMat = NULL,
  dfAdjust = "none",
  sig.level = 0.05,
  INDIV_LVL = FALSE,
  verbose = 1
)
```

## Arguments

DesMat	list, containing a matrix, the design matrix, numeric timepoints, numeric total number of Clusters
--------	--

EffSize	raw effect, i.e. difference between mean under control and mean under intervention
sigma	numeric, residual error of cluster means if no N given.
tau	numeric, standard deviation of random intercepts
eta	numeric (scalar or matrix), standard deviation of random slopes. If 'eta' is given as scalar, 'trtMat' is needed as well.
tauAR	numeric (scalar), value between 0 and 1. Defaults to NULL. If 'tauAR' is not NULL, the random intercept 'tau' is AR1-correlated. *Currently not compatible with 'rho'!=0 !*
etaAR	numeric (scalar), value between 0 and 1. Defaults to NULL. If 'etaAR' is not NULL, the random slope 'eta' is AR1-correlated. *Currently not compatible with 'rho'!=0 !*
rho	numeric (scalar), correlation of 'tau' and 'eta'
gamma	numeric (scalar), random time effect
psi	numeric (scalar), random subject specific intercept. Leads to a closed cohort setting
N	numeric, number of individuals per cluster. Either a scalar, vector of length #Clusters or a matrix of dimension #Clusters x timepoints. Defaults to 'rep(1,sum(CI))' if not passed.
CovMat	numeric, a positive-semidefinite matrix with (#Clusters · timepoints) rows and columns. If 'CovMat' is given, 'sigma', 'tau', 'eta', 'rho' and 'psi' are ignored.
dfAdjust	character, one of the following: "none", "between-within", "containment", "residual".
sig.level	numeric (scalar), significance level, defaults to 0.05
INDIV_LVL	logical, should the computation be conducted on an individual level? This leads to longer run time and is mainly for diagnostic purposes.
verbose	integer, how much information should the function return?

### Value

The return depends on the 'verbose' parameter. If 'verbose'=0, only the power is returned. If 'verbose'=1 (the default), a list containing power and the parameters of the specific setting is returned. If requested (by 'verbose'=2) this list also contains relevant matrices.

---

construct\_CovBlk

*Construct a Block of the Covariance Matrix*

---

### Description

Constructs the covariance matrix for multiple measurements of the same cluster. This function is not designed to be used directly.

**Usage**

```
construct_CovBlk(
  sigma,
  tau,
  eta = NULL,
  tauAR = NULL,
  etaAR = NULL,
  rho = NULL
)
```

**Arguments**

sigma	numeric (vector of length ‘timepoints’), residual error
tau	numeric (vector of length ‘timepoints’), standard deviation of random intercepts
eta	numeric (vector of length ‘timepoints’), standard deviation of random slope
tauAR	numeric (scalar), value between 0 and 1. Defaults to NULL. If ‘tauAR’ is not NULL, the random intercept ‘tau’ is AR1-correlated. *Currently not compatible with ‘rho’!=0 !*
etaAR	numeric (scalar), value between 0 and 1. Defaults to NULL. If ‘etaAR’ is not NULL, the random slope ‘eta’ is AR1-correlated. *Currently not compatible with ‘rho’!=0 !*
rho	numeric (scalar), correlation of ‘tau’ and ‘eta’

**Value**

a block of a covariance matrix, corresponding to intra-cluster covariance over time for one cluster

**Examples**

```
construct_CovBlk(sigma=rep(2,5), tau=rep(1,5))
```

---

construct_CovMat	<i>Construct a Covariance Matrix constructs a (block diagonal) covariance matrix. This function calls ‘construct_CovBlk’ (or ‘construct_CovSubMat’ in case of repeated observations of the same individuals) for each block.</i>
------------------	--

---

**Description**

Construct a Covariance Matrix

constructs a (block diagonal) covariance matrix. This function calls ‘construct\_CovBlk’ (or ‘construct\_CovSubMat’ in case of repeated observations of the same individuals) for each block.

**Usage**

```

construct_CovMat(
  SumCl = NULL,
  timepoints = NULL,
  sigma,
  tau,
  eta = NULL,
  tauAR = NULL,
  etaAR = NULL,
  rho = NULL,
  gamma = NULL,
  trtMat = NULL,
  N = NULL,
  CovBlk = NULL,
  psi = NULL,
  INDIV_LVL = FALSE
)

```

**Arguments**

SumCl	total number of clusters
timepoints	numeric (scalar or vector), number of timepoints (periods). If design is swd, timepoints defaults to length(Cl)+1. Defaults to 1 for parallel designs.
sigma	numeric, residual error of cluster means if no N given.
tau	numeric, standard deviation of random intercepts
eta	numeric (scalar or matrix), standard deviation of random slopes. If 'eta' is given as scalar, 'trtMat' is needed as well.
tauAR	numeric (scalar), value between 0 and 1. Defaults to NULL. If 'tauAR' is not NULL, the random intercept 'tau' is AR1-correlated. *Currently not compatible with 'rho'!=0 !*
etaAR	numeric (scalar), value between 0 and 1. Defaults to NULL. If 'etaAR' is not NULL, the random slope 'eta' is AR1-correlated. *Currently not compatible with 'rho'!=0 !*
rho	numeric (scalar), correlation of 'tau' and 'eta'
gamma	numeric (scalar), random time effect
trtMat	a matrix of dimension *#Cluster* x *timepoints* as produced by the function 'construct_trtMat', indicating the cluster-periods that receive interventional treatment. Defaults to NULL. If trtMat is given, the arguments 'SumCl' and 'timepoints' are ignored (!).
N	numeric, number of individuals per cluster. Either a scalar, vector of length #Clusters or a matrix of dimension #Clusters x timepoints. Defaults to 'rep(1,sum(Cl))' if not passed.
CovBlk	a matrix of dimension *timepoints* x *timepoints*.
psi	numeric (scalar), random subject specific intercept. Leads to a closed cohort setting

INDIV\_LVL      logical, should the computation be conducted on an individual level? This leads to longer run time and is mainly for diagnostic purposes.

### Value

a covariance matrix

### Examples

```
## Two clusters, three timepoints,
## residual standard error sd=3, random slope sd=1.
construct_CovMat(SumCl=2, timepoints=3, sigma=3, tau=1)
##
##
## ... with random slope as AR-1 process
construct_CovMat(SumCl=2, timepoints=3, sigma=3, tau=1, tauAR=.8)
##
##

## ... with sigma and tau varying over time and between clusters:
construct_CovMat(SumCl=2, timepoints=3,
                sigma=matrix(c(1,2,2,1,1,2), nrow=2, byrow=TRUE),
                tau=matrix(c(.2, .1, .1, .2, .2, .1), nrow=2, byrow=TRUE),
                N=c(3,4))
```

---

construct\_CovSubMat      *Construct a Block of the Covariance Matrix*

---

### Description

Constructs the covariance matrix for multiple measurements of the same cluster if the same individuals are observed at all time periods. This function is not designed to be used directly.

### Usage

```
construct_CovSubMat(
  N,
  timepoints,
  sigma,
  tau,
  eta = NULL,
  tauAR = NULL,
  etaAR = NULL,
  rho = NULL,
  gamma = 0,
  trtMat = NULL,
  psi = NULL,
```

```

    INDIV_LVL = FALSE
  )

```

### Arguments

N	Number of individuals per cluster
timepoints	numeric (scalar or vector), number of timepoints (periods). If design is swd, timepoints defaults to length(Cl)+1. Defaults to 1 for parallel designs.
sigma	numeric (vector of length 'timepoints'), residual error
tau	numeric (vector of length 'timepoints'), standard deviation of random intercepts
eta	numeric (vector of length 'timepoints'), standard deviation of random slope
tauAR	numeric (scalar), value between 0 and 1. Defaults to NULL. If 'tauAR' is not NULL, the random intercept 'tau' is AR1-correlated. *Currently not compatible with 'rho'!=0 !*
etaAR	numeric (scalar), value between 0 and 1. Defaults to NULL. If 'etaAR' is not NULL, the random slope 'eta' is AR1-correlated. *Currently not compatible with 'rho'!=0 !*
rho	numeric (scalar), correlation of 'tau' and 'eta'
gamma	numeric (vector of length 'timepoints'), standard deviation of a random time effect.
trtMat	a matrix of dimension <i>*#Cluster*</i> x <i>*timepoints*</i> as produced by the function 'construct_trtMat', indicating the cluster-periods that receive interventional treatment. Defaults to NULL. If trtMat is given, the arguments 'SumCl' and 'timepoints' are ignored (!).
psi	numeric (scalar), random subject specific intercept. Leads to a closed cohort setting
INDIV_LVL	logical, should the computation be conducted on an individual level? This leads to longer run time and is mainly for diagnostic purposes.

### Value

a block of a covariance matrix with two levels of clustering, corresponding to intra-cluster covariance over time for one cluster

---

construct_DesMat	<i>Construct the Design Matrix Constructs the design matrix with one column for every (fixed) parameter to be estimated and one row for every cluster for every timepoint. This function calls 'construct_trtMat' to construct a matrix with '#cluster' columns and '#timepoints' rows, indicating treatment status fore each cluster at each timepoint. This is then transformed into the first column of the design matrix. 'construct_CovMat' further calls 'construct_timeajust' to get the fixed effect(s) of the timepoints. Note: Unlike the usual notation, the treatment effect is in the first column (for easier access by higher level functions).</i>
------------------	--

---

## Description

Construct the Design Matrix

Constructs the design matrix with one column for every (fixed) parameter to be estimated and one row for every cluster for every timepoint. This function calls 'construct\_trtMat' to construct a matrix with '#cluster' columns and '#timepoints' rows, indicating treatment status fore each cluster at each timepoint. This is then transformed into the first column of the design matrix. 'construct\_CovMat' further calls 'construct\_timeajust' to get the fixed effect(s) of the timepoints.

Note: Unlike the usual notation, the treatment effect is in the first column (for easier access by higher level functions).

## Usage

```
construct_DesMat(
  Cl = NULL,
  trtDelay = NULL,
  dsntype = "SWD",
  timepoints = NULL,
  timeAdjust = "factor",
  period = NULL,
  trtmatrix = NULL,
  timeBlk = NULL,
  N = NULL,
  INDIV_LVL = FALSE
)
```

## Arguments

Cl	integer (vector), number of clusters per sequence group (in SWD), or number in control and intervention (in parallel designs)
trtDelay	numeric (possibly vector), value(s) between 0 and 1 specifying the intervention effect in the first (second ... ) intervention phase
dsntype	character, defines the type of design. Options are "SWD", "parallel" and "parallel_baseline", defaults to "SWD".
timepoints	numeric (scalar or vector), number of timepoints (periods). If design is swd, timepoints defaults to length(Cl)+1. Defaults to 1 for parallel designs.
timeAdjust	character, specifies adjustment for time periods. One of the following: "factor", "linear", "none", "periodic". Defaults to "factor".
period	numeric (scalar)
trtmatrix	an optional user defined matrix to define treatment allocation
timeBlk	an optional user defined matrix that defines the time adjustment in one cluster. Is repeated for every cluster.
N	numeric, number of individuals per cluster. Either a scalar, vector of length #Clusters or a matrix of dimension #Clusters x timepoints. Defaults to 'rep(1,sum(Cl))' if not passed.
INDIV_LVL	logical, should the computation be conducted on an individual level? This leads to longer run time and is mainly for diagnostic purposes.

**Value**

an object of class DesMat

**Examples**

```
construct_DesMat(CI=c(2,0,1))
construct_DesMat(CI=c(2,0,1), N=c(1,3,2))
```

---

construct\_timeadjust    *Construct the time period adjustment in the design matrix*

---

**Description**

Construct the time period adjustment in the design matrix

**Usage**

```
construct_timeadjust(
  CI,
  timepoints,
  timeAdjust = "factor",
  period = NULL,
  timeBlk = NULL
)
```

**Arguments**

CI	integer (vector), number of clusters per sequence group (in SWD), or number in control and intervention (in parallel designs)
timepoints	numeric (scalar or vector), number of timepoints (periods). If design is swd, timepoints defaults to length(CI)+1. Defaults to 1 for parallel designs.
timeAdjust	character, specifies adjustment for time periods. One of the following: "factor", "linear", "none", "periodic". Defaults to "factor".
period	numeric (scalar)
timeBlk	an optional user defined matrix that defines the time adjustment in one cluster. Is repeated for every cluster.

**Value**

a matrix with one row for every cluster at every timepoint and columns depending of adjustment type.

---

construct_trtMat	<i>Construct Treatment Matrix</i>
------------------	-----------------------------------

---

**Description**

Constructs a matrix of '#cluster' rows and '#timepoint' columns, indicating treatment status in each cluster at each timepoint.

**Usage**

```
construct_trtMat(Cl, trtDelay, dsntype, timepoints = NULL)
```

**Arguments**

Cl	integer (vector), number of clusters per sequence group (in SWD), or number in control and intervention (in parallel designs)
trtDelay	numeric (possibly vector), value(s) between 0 and 1 specifying the intervention effect in the first (second ... ) intervention phase
dsntype	character, defines the type of design. Options are "SWD", "parallel" and "parallel_baseline", defaults to "SWD".
timepoints	numeric (scalar or vector), number of timepoints (periods). If design is swd, timepoints defaults to length(Cl)+1. Defaults to 1 for parallel designs.

**Value**

a matrix trtMat, where rows and columns correspond to cluster and timepoints, respectively

**Examples**

```
construct_trtMat(Cl=c(1,2,1), trtDelay=c(.2,.8), dsntype="SWD")
```

---

plot.DesMat	<i>plot.DesMat</i>
-------------	--------------------

---

**Description**

plot.DesMat

**Usage**

```
## S3 method for class 'DesMat'
plot(x, ...)
```

**Arguments**

x                    d  
 ...                  Arguments to be passed to methods

**Value**

a plotly html widget, displaying the treatment status

---

plot.wlsPower                  *plot an object of class 'wlsPower'*

---

**Description**

Plot a matrix that visualises the influence of each cluster for each timepoint

**Usage**

```
## S3 method for class 'wlsPower'
plot(x, ...)
```

**Arguments**

x                    object of class wlsPower  
 ...                  Arguments to be passed to methods

**Value**

a plotly html widget

---

print.DesMat                  *print.DesMat*

---

**Description**

print.DesMat

**Usage**

```
## S3 method for class 'DesMat'
print(x, ...)
```

**Arguments**

x                    object of class DesMat  
 ...                  Arguments to be passed to methods

**Value**

Messages with information about the design.

---

print.wlsPower	<i>print.wlsPower</i>
----------------	-----------------------

---

**Description**

print.wlsPower

**Usage**

```
## S3 method for class 'wlsPower'  
print(x, ...)
```

**Arguments**

x	object of class wlsPower
...	Arguments to be passed to methods

**Value**

Messages, containing information about (at least) power and significance level

---

SteppedPower-pkg	<i>SteppedPower</i>
------------------	---------------------

---

**Description**

SteppedPower offers tools for power and sample size calculation as well as design diagnostics for longitudinal mixed model settings, with a focus on stepped wedge designs. All calculations are oracle estimates i.e. assume random effect variances to be known (or guessed) in advance.

**Author(s)**

Philipp Mildenerger <pmildenb@uni-mainz.de>

tTestPwr	<i>Compute Power of a Wald Test computes the power of a scaled Wald test given a standard error, an effect size, the degrees of freedom of the t-distribution and a significance level. Computes the exact power, see second example</i>
----------	--

---

### Description

Compute Power of a Wald Test

computes the power of a scaled Wald test given a standard error, an effect size, the degrees of freedom of the t-distribution and a significance level. Computes the exact power, see second example

### Usage

```
tTestPwr(d, se, df, sig.level = 0.05)
```

### Arguments

d	numeric, raw effect
se	numeric, standard error
df	numeric, degrees of freedom of the t-distribution
sig.level	numeric, significance level, defaults to 0.05

### Value

a scalar

### Examples

```
tTestPwr(4,1,10) ; tTestPwr(4,1,30) ; tTestPwr(4,1,Inf)
```

---

wlsPower	<i>Compute power</i>
----------	----------------------

---

### Description

This is the main function of the SteppedPower package. It calls the constructor functions for the design matrix and covariance matrix, and then calculates the variance of the intervention effect estimator. The latter is then used to compute the power of a Wald test of a (given) intervention effect.

**Usage**

```
wlsPower(
  Cl = NULL,
  timepoints = NULL,
  DesMat = NULL,
  trtDelay = NULL,
  incomplete = NULL,
  timeAdjust = "factor",
  period = NULL,
  dsntype = "SWD",
  mu0,
  mu1,
  marginal_mu = FALSE,
  sigma = 1,
  tau = NULL,
  eta = NULL,
  tauAR = NULL,
  rho = NULL,
  gamma = NULL,
  psi = NULL,
  alpha_0_1_2 = NULL,
  CovMat = NULL,
  N = NULL,
  Power = NULL,
  family = "gaussian",
  N_range = c(1, 1000),
  sig.level = 0.05,
  dfAdjust = "none",
  INDIV_LVL = FALSE,
  verbose = 1
)
```

**Arguments**

Cl	integer (vector), number of clusters per sequence group (in SWD), or number in control and intervention (in parallel designs)
timepoints	numeric (scalar or vector), number of timepoints (periods). If design is swd, timepoints defaults to length(Cl)+1. Defaults to 1 for parallel designs.
DesMat	matrix of dimension ... , if supplied, 'timepoints', 'Cl', 'trtDelay' are ignored.
trtDelay	numeric (possibly vector), value(s) between 0 and 1 specifying the intervention effect in the first (second ... ) intervention phase
incomplete	integer, either a vector (only for SWD) or a matrix. A vector defines the number of periods before and after the switch from control to intervention that are observed. A matrix consists of 1's for observed clusterperiods and 0's for unobserved clusterperiods.
timeAdjust	character, specifies adjustment for time periods. One of the following: "factor", "linear", "none", "periodic". Defaults to "factor".

period	numeric (scalar)
dsntype	character, defines the type of design. Options are "SWD", "parallel" and "parallel_baseline", defaults to "SWD".
mu0	numeric (scalar), mean under control
mu1	numeric (scalar), mean under treatment
marginal_mu	logical. Only relevant for non-gaussian outcome. Indicates whether mu0 and mu1 are to be interpreted as marginal prevalence under control and under treatment, respectively, or whether they denote the prevalence conditional on random effects being 0 (It defaults to the latter).
sigma	numeric, residual error of cluster means if no N given.
tau	numeric, standard deviation of random intercepts
eta	numeric (scalar or matrix), standard deviation of random slopes. If 'eta' is given as scalar, 'trtMat' is needed as well.
tauAR	numeric (scalar), value between 0 and 1. Defaults to NULL. If 'tauAR' is not NULL, the random intercept 'tau' is AR1-correlated. *Currently not compatible with 'rho'!=0 !*
rho	numeric (scalar), correlation of 'tau' and 'eta'
gamma	numeric (scalar), random time effect
psi	numeric (scalar), random subject specific intercept. Leads to a closed cohort setting
alpha_0_1_2	numeric vector of length 3, that consists of alpha_0, alpha_1 and alpha_2. This is an alternative way to define the correlation structure, following Li et al. (2018).
CovMat	numeric, a positive-semidefinite matrix with (#Clusters · timepoints) rows and columns. If 'CovMat' is given, 'sigma', 'tau', 'eta', 'rho' and 'psi' are ignored.
N	numeric, number of individuals per cluster. Either a scalar, vector of length #Clusters or a matrix of dimension #Clusters x timepoints. Defaults to 'rep(1,sum(CI))' if not passed.
Power	numeric, a specified target power. If supplied, the minimal 'N' is returned.
family	character, distribution family. One of "gaussian", "binomial". Defaults to "gaussian"
N_range	numeric, vector specifying the lower and upper bound for 'N', ignored if 'Power' is NULL.
sig.level	numeric (scalar), significance level, defaults to 0.05
dfAdjust	character, one of the following: "none", "between-within", "containment", "residual".
INDIV_LVL	logical, should the computation be conducted on an individual level? This leads to longer run time and is mainly for diagnostic purposes.
verbose	integer, how much information should the function return?

### Details

Let  $\theta := \mu_1 - \mu_0$  the treatment effect under investigation. The variance of the treatment effect estimator  $\hat{\theta}$  can then be estimated via weighted least squares (see also vignette 'Getting Started').

**Value**

The return depends on the 'verbose' parameter. If 'verbose'=0, only the power is returned. If 'verbose'=1 (the default), a list containing power and the parameters of the specific setting is returned. If requested (by 'verbose'=2) this list also contains relevant matrices.

**Examples**

```
## See also vignette for more examples
##
##
## stepped wedge design with 5 Clusters in 5 sequences,
## residual standard deviation 2,
## cluster effect sd = 0.33, and 10 individuals per cluster.
## Further, let the mean under the null and alternative hypothesis 0 and 1,
## respectively.
wlsPower(mu0=0, mu1=1, Cl=rep(1,5), sigma=2, tau=0.33, N=10)
##
##
## ... with auto-regressive cluster effect `tauAR=0.7`.
wlsPower(mu0=0, mu1=1, Cl=rep(1,5), sigma=2, tau=0.33, tauAR=0.7, N=10)
##
##
## ... with varying cluster size
wlsPower(mu0=0, mu1=1, Cl=rep(1,5), sigma=2, tau=0.33, N=c(12,8,10,9,14))
wlsPower(mu0=0, mu1=1, Cl=rep(1,5), sigma=2, tau=0.33,
         N=matrix(c(12,8,10,9,14,
                    11,8,10,9,13,
                    11,7,11,8,12,
                    10,7,10,8,11,
                    9,7, 9,7,11,
                    9,6, 8,7,11),5,6))
##
##
## ... with random treatment effect (with standard deviation 0.2),
## which is correlated with the cluster effect with `rho`=0.25.
wlsPower(mu0=0, mu1=1, Cl=rep(1,5), sigma=2, tau=0.33, eta=.2, rho=.25, N=10)
##
##
## ... with missing observations (a.k.a. incomplete stepped wedge design)
wlsPower(mu0=0, mu1=1, Cl=rep(1,5), sigma=2, tau=0.33, N=10, incomplete=3)
wlsPower(mu0=0, mu1=1, Cl=rep(1,5), sigma=2, tau=0.33, N=10,
         incomplete=matrix(c(1,1,1,0,0,
                             1,1,1,1,0,
                             1,1,1,1,1,
                             1,1,1,1,1,
                             0,1,1,1,1,
                             0,0,1,1,1),5,6))
## -> the same.
##
## ... with two levels of clustering. This arises if the patients are
## observed over the whole study period
## (often referred to as closed cohort design) or if subclusters exist
```

```

## (such as wards within clinics). For
mod_aggr <- wlsPower(mu0=0, mu1=1, Cl=rep(1,5),
