Package ‘TTAinterfaceTrendAnalysis’

October 6, 2021

Type Package

Title Temporal Trend Analysis Graphical Interface

Version 1.5.8

Date 2021-10-06

Description This interface was created to develop a standard procedure to analyse temporal trend in the framework of the OSPAR convention. The analysis process run through 4 successive steps : 1) manipulate your data, 2) select the parameters you want to analyse, 3) build your regulated time series, 4) perform diagnosis and analysis and 5) read the results. Statistical analysis call other package function such as Kendall tests or cusum() function.

License GPL (>= 2)

**TTAinterface-package  ** *Interface Package for Temporal Trend Analysis*

**Description**

A friendly interface to perform Temporal Trend Analyses (MannKendall tests). Just follow the successive step from the data formatting to the results sorting.

**Details**

- **Package:** TTAinterface
- **Type:** Package
- **Version:** 1.5.7
- **Date:** 2021-05-27
- **License:** GPL (>=2)

**Author(s)**

David Devreker, Alain Lefebvre
Maintainer: <david.devreker@ifremer.fr>

**References**

**Description**

Display logo, version and developers name and email of the package.
Envir

Usage

about()

Details

Display logo, version and developers name of the package.

Envir  A temporary environment to stock data and objects

Description

The function create an environment where the data, arguments and objects that are used between the different functions of the package will be stored for better exchange processes.

Usage

Envir()

Details

Objects passed through the environment 'Envir' are called in the other function as Envir$objects

fixdata  Fixdata function

Description

Simply modify your database through the interface.

Usage

fixdata()

Value

The edited database that is automatically read by the interface to replace former values.

Note

fixdata() call the function fix() that acts on the raw database. The fix() function itself calls the function edit() from the package utils.

fix edit
FULLoption

Main function

Description

This is the core function of the interface. It receive arguments from the interface (see the function <TTAinterface>) and build regularized time series, perform diagnostics and analyses.

Usage

```R
FULLoption(param, depth=NULL, sal = NULL, site=NULL, rawdata="NO", select="NO", resume.reg="NO", test.normality="NO", plotB = "NO", selectBox="ByYears", log.trans="NO", plotZ="NO", datashow="NO", help.timestep = "NO", auto.timestep = "NO", time.step = NULL, help.aggreg = "NO", auto.aggreg = "NO", aggreg = NULL, mix = "YES", outliers.re = "NO", na.replace="NO", start = NULL, end = NULL, months = c(1:12), norm = "NO", npsu = 30, test.on.remaider = "NO", autocorr = "NO", spectrum="NO", anomaly="NO", a.barplot="NO", zsmooth="NO", local.trend = "NO", test = "MK")
```

Arguments

- **param**: The name of the parameter you want to analyse. It must be the name of the column where your data are. Have to be enter like this: "yourparam".
- **depth**: If existing, the depth interval where your data will be analysed. If values are different from depth max and depth min, missing values are excluded. Depth column must be named as 'DEPTH'. Enter the value like this: c(a,b). For analysis at one specific depth you can enter c(a,a).
- **sal**: Same thing as for the depth Salinity column must be named as 'S'.
- **site**: Labels of sampling site as they appear in the database. Enter the value like this: c("S1", "S2").
- **rawdata**: Perform descriptive statistics on raw database, can be "YES" or "NO" (the default).
- **select**: Perform descriptive statistics on selected parameter and site, can be "YES" or "NO" (the default).
- **resume.reg**: Perform descriptive statistics on regularized time series, can be "YES" or "NO" (the default).
- **test.normality**: Perform a Shapiro-Wilk normality test on selected parameter, can be "YES" or "NO" (the default).
- **plotB**: Display a boxplot of raw data with outliers identified as circle, can be "YES" or "NO" (the default).
- **selectBox**: Options for plotB: allow to choose between boxplot by years or by months.
- **log.trans**: This option transforms your data in log(x+1) prior to perform analysis.
- **plotZ**: Display a plot of the regularized time series, can be "YES" or "NO" (the default).
- **datashow**: Show a table of the regularized data, can be "YES" or "NO" (the default).
help.timestep  Display an advice for time step selection, base on the mean time that separate two successive measurements. Can be "YES" or "NO" (the default).

auto.timestep  Autoexecute the advice without display it.

time.step  Choice of the time step for data aggregation during the build of the time series, can be "Fortnight", "Semi-fortnight", "Mensual", "Annual" or "Mono-mensual" for an aggregation of the data of a month of all years (e.g. all January data).

help.aggreg  Display an advice for method of aggregation selection, base on Wilcoxon p.value between rawdata and the different method. Can be "YES" or "NO" (the default).

auto.aggreg  Autoexecute the advice without display it.

 aggreg  Choice of the method of aggregation during the build of the time series, can be "Mean", "Median", "Max" for maximal value selection or "Quantile" for selection of the quantile 90

mix  Allow to mix the data of all sampling site during analysis. Permanently set to "YES" and removed from the GUI since version 1.5.

outliers.re  Remove the outliers from the rawdata, the outliers list is save in a .csv file. (for outliers visual identification see boxplot section).

na.replace  Replace missing values with median of the corresponding cycle (week, month...) for lags longer than 3 days and linear regression for shorter missed period. Can be "YES" or "NO" (the default).

start  Define the first year of data analysis (by default the first of the database).

del  Define the last year of data analysis (by default the last of the database).

months  Define the months of data analysis (by default the twelve months).

norm  Compute normalised values of nutrients at the salinity npsu for each years, can be "YES" or "NO" (the default).

npsu  Compute normalised values of nutrients at the salinity npsu for each years, 30 by default.

test.on.remaider  Extract the reminders from the data series using the stl package functions to perform statistical analysis.

autocorr  Display the autocorrelation diagramme of the regularized time series using the acf function with arguments : lag.max = ((nrow(TimeSerie))/2), na.action = na.pass. Can be "YES" or "NO" (the default)

spectrum  Display the Fourrier spectrum of the regularized time series using a Smoothed Periodogram (spec.pgram). Can be "YES" or "NO" (the default).

anomaly  Display a color box (function filled.contour) plot by year each time.step (months or weeks) minus the mean of the time.step of all years. Red colors show positive anomalies and blue colors negative anomalies. Can be "YES" or "NO" (the default).

a.barplot  Display an anomaly barplot as a function of the time.step. Red colors show positive anomalies and blue colors negative anomalies. Can be "YES" or "NO" (the default).

zsMOOTH  Display a detrended plot of the time series using the stl function with arguments s.window="periodic", na.action=na.fail. Can be "YES" or "NO" (the default).
local.trend    Display the interactive cusum plot of the time series (local.trend of the pastecs package) that allow to manually identify the period of change in the tendency using the function identify and perform a Kendall family test on each identified period (see test section). Can be "YES" or "NO" (the default).

test    Perform a test to evaluate the presence and the magnitude of a temporal trend on the time series. Can be "MK" for Seasonal Mann-Kendall test (the default), "SMK" for the same test with detail for each time step, "LOESS" that fit a polynomial surface determined by one or more numerical predictors, using local fitting; a MK is perform on this fitting.

Value

Results are return as .png figures or .txt files Results are also directly readable directly in the right part of the interface.

Save path can be choose using the option ’Select directory’ (see the function selectdirectory more informations)

Name of saved filed follow the nomenclature : Original.file.name_analysis.name_parameter.txt/png or for multiple period analysis (see cusum for more details) : Original.file.name_analysis.name_parameter_starting.year_ending.years.txt

analysis.names are :

_boxplot_ for boxplot figure (.png). _Outliers_ for the save of removed outliers (.txt). _TimeSeries_ for the plot of the regularized time series (.png). _Regularised_data_ for the table of regularized time series (.txt). _Autocor_ for the autocorrelation diagram (.png). _Spectrum_ for the Fourier spectrum plot (.png). _ColorPlot_ for the anomaly color plot (.png). _Anomaly BarPlot_ for the anomaly barplot (.png) _Detrended_ for detrended plot (.png). _Local_Global Trend_ for result of Seasonal Mann Kendall apply to local trend (.txt). _Local_Seasonal Trend_ same as above with detail for each time step (.txt). _Global Trend_ for result of Seasonal Mann Kendall (.txt). _Seasonal Trend_ same as above with detail for each time step (.txt). _LOESSplot_ for loess plot (.png). _NormalNutri_ for analysis of normalized values of nutrients (.png).

See values output of corresponding functions.

interpTs    Interpolate or substitute missing time series values (code of the former wq package)

Description

Interpolates or substitutes missing data in a time series for gaps up to a specified size.
Usage

```r
interpTs(x, type = c("linear", "series.median", "series.mean", "cycle.median", "cycle.mean"), gap = NULL)
```

Arguments

- `x`: object of class "ts" or "mts"
- `type`: method of interpolation or substitution
- `gap`: maximum gap to be replaced

Value

The time series with some or all missing values replaced.

Author(s)

Alan D. Jassby and James E. Cloern

---

mannKen

*Mann-Kendall trend test and the Sen slope (code modified from the former wq package)*

Description

Applies Kendall’s tau test for the significance of a monotonic time series trend. Also calculates the Sen slope as an estimate of this trend.

Usage

```r
mannKen(x, ...)
```

Arguments

- `x`: A numeric vector, matrix or data frame
- `...`: Other arguments to pass to plotting function

Value

A list of the following if `x` is a vector:

- `sen.slope` (Sen slope)
- `sen.slope.rel` (Relative Sen slope)
- `p.value` (Significance of slope)
- `S` (Kendall’s S)
- `varS` (Variance of S)
- `miss` (Fraction of missing slopes connecting first and last fifths of `x` or a matrix with corresponding columns if `x` is a matrix or data frame.)
**Description**

Calculates the Seasonal or Regional Kendall test of trend significance, including an estimate of the Sen slope.

**Usage**

```r
seaKen(x, ...)  
```

**Arguments**

- `x`: A numeric vector, matrix or data frame made up of seasonal time series
- `...`: Other arguments to pass to plotting function

**Value**

A list of the following if `x` is a vector: `seaKen` returns a list with the following members:
- `sen.slope`: Sen slope
- `sen.slope.pct`: Sen slope as percent of mean
- `p.value`: significance of slope
- `miss`: for each season, the fraction missing of slopes connecting first and last 20 percent of the years or a matrix with corresponding columns if `x` is a matrix or data frame.

**Author(s)**

Alan D. Jassby and James E. Cloern

**See Also**

- `seaKen`, `seasonTrend`
seasonTrend

Determine seasonal trends (code modified from the former wq package)

Description

Finds the trend for each season and each variable in a time series.

Usage

seasonTrend(x, ...)

Arguments

x Time series vector, or time series matrix with column names
...

Further options to pass to plotting function

Value

A data frame with the following fields:

- series series names
- season season number
- sen.slope Sen slope in original units per year
- sen.slope.rel Sen slope divided by median for that specific season and series
- p p-value for the trend according to the Mann-Kendall test.
- missing Proportion of slopes joining first and last fifths of the data that are missing

Author(s)

Alan D. Jassby and James E. Cloern

mannKen
selectdirectory  

Saved path selection

Description

Allow to chose the directory where results (.txt and .png files) will be saved.

Usage

selectdirectory()

Details

It select the main save directory: the package will create appropriate sub-folder as function of selected parameters, statistics, methods etc. Then you will be able to perform successive analyses without overwriting the previous results.

SRNDunkerque  

Coastal survey near the Gravelines power plant form 1995 to 2010

Description

Variation in temperature, salinity and chlorophyll-a concentration (microg/l) monthly measured between 1995 and 2010 at three different stations distributed onshore to offshore (North Sea) near the city of Dunkerque (north of France) for the SRN monitoring program (Ifremer). This database contain many missing values.

Format

A data.frame (TXT) containing 1561 measurements of temperature, salinity and chlorophyll-a concentration

Source

The Ifremer QUADRIGE_2 meta-database
TTAinterface

---

**Description**

A friendly user graphic interface to perform temporal trend analysis. The interface offer multiple options to select parameters and build time series that the user can follow step by step. Some options are selected by default to let the hurry user to do really quick analysis. Some diagnostic tools are also present.

**Usage**

```r
TTAinterface()
```

**Value**

Results are saved in .txt files or .png figures in the desire directory (see selectdirectory). See 'FULLoption' values fore more details.
