Title  ZOIP Distribution, ZOIP Regression, ZOIP Mixed Regression

Description  The ZOIP distribution (Zeros Ones Inflated Proportional) is a proportional data distribution inflated with zeros and/or ones, this distribution is defined on the most known proportional data distributions, the beta and simplex distribution, Jørgensen and Barndorff-Nielsen (1991) <doi:10.1016/0047-259X(91)90008-P>, also allows it to have different parameterizations of the beta distribution, Ferrari and Cribari-Neto (2004) <doi:10.1080/0266476042000214501>, Rigby and Stasinopoulos (2005) <doi:10.18637/jss.v023.i07>. The ZOIP distribution has four parameters, two of which correspond to the proportion of zeros and ones, and the other two correspond to the distribution of the proportional data of your choice. The 'ZOIP' package allows adjustments of regression models for fixed and mixed effects for proportional data inflated with zeros and/or ones.

dZOIP  ................................................... 3
Description

Extract ZOIP model coefficients.

Usage

### S3 method for class 'ZOIP'

```r
cdf(object, ...)```

Arguments

- `object`: An object of class ZOIP.
- `...`: other arguments.

Examples

```r
# Test 1
library(ZOIP)
library(boot)
n<-1000
x1<-(runif(n))
x2<-(runif(n))
b1<-0.3
b2<-0.5
b3<-0.9
sigma_i<-(boot::inv.logit(b1+b2*x1+b3*x2))
c1<-0.2
c2<-1
c3<-0.1
mu_i<-(boot::inv.logit(c1+c2*x1))
d1<-0.07
p0_i<-(rep(d1,length(n)))
e1<-0.02
e2<-4```
p1.1<-boot::inv.logit(e1+e2*x2)
param<-cbind(mu_i,sigma_i,p0_i,p1_i)

system.time(y_i<-apply(param,1,function(x){rZOIP(1, mu=x[1], sigma=x[2], p0=x[3], p1=x[4], family='R-S')}))
data<-as.data.frame(cbind(y_i,x1,x2))

formula.mu=y_i~x1
formula.sigma=~x1+x2
formula.p0=~1
formula.p1=~x1+x2
link=c('logit','logit','identity','logit')
family='R-S'
mod<RM.ZOIP(formula.mu=formula.mu,formula.sigma=formula.sigma, formula.p0=formula.p0,formula.p1=formula.p1,data=data,link=link,family=family)
coef(mod)

---

dZOIP

ZOIP Distribution

Description

The dZOIP function defines the probability density function of the ZOIP distribution.

Usage

```
dZOIP(x, mu = 0.5, sigma = 0.1, p0 = 0.08333333, p1 = 0.08333333, family = "R-S", log = FALSE)
```

Arguments

- **x**: quantiles vector.
- **mu**: vector of location parameters.
- **sigma**: vector of scale parameters.
- **p0**: parameter of proportion of zeros.
- **p1**: parameter of proportion of ones.
- **family**: choice of the parameterization or distribution, family = 'R-S' parameterization beta distribution Rigby and Stasinopoulos, 'F-C' distribution Beta parametrization Ferrari and Cribari-Neto, 'Original' Beta distribution classic parameterization, 'Simplex' simplex distribution.
- **log**: logical; if TRUE, the probabilities of p will be given as log (p).
Details

x has ZOIP distribution with shape parameters "\( \mu \)", scale "\( \sigma \)"., proportion of zeros "\( p_0 \)" and proportion of ones "\( p_1 \)"., has density: \( p_0 \) if \( x = 0 \), \( p_1 \) if \( x = 1 \), \((1 - p_0 - p_1)f(x; \mu, \sigma)\) yes \( 0 < x < 1 \).

where \( p_0 \geq 0 \) represents the probability that \( x = 0 \), \( p_1 \geq 0 \) represents the probability that \( x = 1 \), \( 0 \leq p_0 + p_1 \leq 1 \) and \( f(x; \mu, \sigma) \) represents some of the functions of probability density for proportional data, such as the beta distribution with its different parameterizations and the simplex distribution.

When family = ' R-S ' uses the beta distribution with beta parameterization Rigby and Stasinopoulos (2005) which has a beta distribution function. \( \mu \) is the parameter of mean and shape, plus \( \sigma \) is the dispersion parameter of the distribution. family = ' F-C ' distribution Beta parameterization Ferrari and Cribari-Neto (2004), where \( \sigma = \phi \), \( \phi \) is a precision parameter. family = ' Original ' beta distribution original parameterization where \( \mu = a \), a parameter of form 1; \( \sigma = b \), b parameter of form 2. family = ' Simplex ' simplex distribution. proposed by Barndorff-Nielsen and Jørgensen (1991)

Examples

```
library(zoip)
dZOIP(x=0.5, mu = 0.2, sigma = 0.5, p0 = 0.2, p1 =0.2,family='R-S',log = FALSE)
dZOIP(x=0.5, mu = 0.2, sigma = 3, p0 = 0.2, p1 = 0.2,family='F-C',log = FALSE)
dZOIP(x=0.5, mu = 0.6, sigma = 2.4, p0 = 0.2, p1 = 0.2,family='Original',log = FALSE)
dZOIP(x=0.5, mu = 0.2, sigma = 3, p0 = 0, p1 = 0,family='Simplex',log = FALSE)
dZOIP(x=0.5, mu = 0.2, sigma = 0.5, p0 = 0, p1 =0.2,family='R-S',log = FALSE)
dZOIP(x=0.5, mu = 0.2, sigma = 0.5, p0 = 0, p1 =0.2,family='R-S',log = FALSE)
```

print.ZOIP

---

Description

print a ZOIP model.

Usage

```
## S3 method for class 'ZOIP'
print(x, ...)
```

Arguments

- `x` An object of class ZOIP.
- ... other arguments.
Examples

```r
#Test 1----------------------------------------
library(ZOIP)
library(boot)
n<-1000
x1<-stats::runif(n)
x2<-stats::runif(n)

b1<-0.3
b2<-0.5
b3<-0.9
sigma_i<-boot::inv.logit(b1+b2*x1+b3*x2)

c1<-0.2
c2<-1
c3<-0.1
mu_i<-boot::inv.logit(c1+c2*x1)

d1<-0.07
p0_i<-rep(d1,length(n))

e1<-0.02
e2<-4
p1_i<-boot::inv.logit(e1+e2*x2)

param<-cbind(mu_i,sigma_i,p0_i,p1_i)

system.time(y_i<-apply(param,1,function(x){rZOIP(1,mu=x[1],sigma=x[2],
                                        p=x[3],p1=x[4],family='R-S')})))
data<-as.data.frame(cbind(y_i,x1,x2))

formula.mu=y_i-x1
formula.sigma=x1+x2
formula.p0=1
formula.p1=x1+x2
link=c('logit','logit','identity','logit')
family='R-S'
mod<-RM.ZOIP(formula.mu=formula.mu/formula.sigma=formula.sigma,
              formula.p0=formula.p0/formula.p1=formula.p1/data=data,link=link,family=family)
mod
```

Description

print.ZOIPM

print a ZOIP model mixed.
Usage

```r
## S3 method for class 'ZOIPM'
print(x, ...)
```

Arguments

- `x`: An object of class ZOIPM.
- `...`: other arguments.

Examples

```r
library(ZOIP)

N <- 2
ni <- 10
set.seed(12345)
Ciudad <- rep(1:N, each=ni)
Total_mora <- rexp(N*ni, rate=1)
set.seed(12345)
b0i <- rep(rnorm(n=N, sd=0.5), each=ni)
set.seed(12345)
b1i <- rep(rnorm(n=N, sd=0.4), each=ni)

eta <- (-1.13+b0i)+0.33*Total_mora
eta2 <- (0.33+b1i)+0.14*Total_mora

mu <- 1 / (1 + exp(-eta))
sigma <- 1 / (1 + exp(-eta2))

p0 <- 0.05
p1 <- 0.05

mu[mu == 1] <- 0.999
mu[mu == 0] <- 0.001

sigma[sigma == 1] <- 0.999
sigma[sigma == 0] <- 0.001
family <- 'R5'
set.seed(12345)
Y <- rZOIP(n=length(mu), mu = mu, sigma = sigma , p0=p0, p1=p1, family=family)
data_sim <- data.frame(Y, Total_mora, Ciudad)

n.points <- 3
pruning <- TRUE

formula.mu = Y ~ Total_mora
formula.sigma = ~ Total_mora
formula.p0 = ~ 1
formula.p1 = ~ 1
```
```r
formula.random = ~ 1 | Ciudad
link=c('logit','logit','identity','identity')
optimizer<-'nlminb'

mod <- RMi.ZOIP(formula.mu=formula.mu,formula.sigma=formula.sigma,formula.p0=formula.p0,
                 formula.p1=formula.p1,data=data_sim,formula.random=formula.random,link=link,
                 family=family,optimizer=optimizer,n.points=n.points,pruning=pruning)
```

### Description

The pZOIP function defines the cumulative distribution function of the ZOIP distribution.

### Usage

```r
pZOIP(q, mu = 0.5, sigma = 0.1, p0 = 0.08333333, p1 = 0.08333333,
     family = "R-S", lower.tail = TRUE, log.p = FALSE)
```

### Arguments

- **q**: quantiles vector.
- **mu**: vector of location parameters.
- **sigma**: vector of scale parameters.
- **p0**: parameter of proportion of zeros.
- **p1**: Parameter of proportion of ones.
- **family**: choice of the parameterization or distribution, family = 'R-S' parameterization beta distribution Rigby and Stasinopoulos, 'F-C' distribution Beta parametrization Ferrari and Cribari-Neto, 'Original' Beta distribution classic parameterization, 'Simplex' simplex distribution.
- **lower.tail**: logical; if TRUE (default), probabilities will be P [X <= x], otherwise, P [X > x].
- **log.p**: logical; if TRUE, the probabilities of p will be given as log (p).

### Details

x has ZOIP distribution with shape parameters "μ", scale "σ", proportion of zeros "p0" and proportion of ones "p1", has density: p0 if x = 0, p1 if x = 1, (1 - p0 - p1) f(x; μ, σ) yes 0 < x < 1.

where p0 ≥ 0 represents the probability that x = 0, p1 ≥ 0 represents the probability that x = 1, 0 ≤ p0 + p1 ≤ 1 and f(x; μ, σ) represents some of the functions of probability density for proportional data, such as the beta distribution with its different parameterizations and the simplex distribution.
When family = 'R-S' uses the beta distribution with beta parameterization Rigby and Stasinopoulos (2005) which has a beta distribution function. \( \mu \) is the parameter of mean and shape, plus \( \sigma \) is the dispersion parameter of the distribution. family = 'F-C' distribution Beta parametrization Ferrari and Cribari-Neto (2004), where \( \sigma = \phi , \phi \) is a precision parameter. family = 'Original' beta distribution original parametrization where \( \mu = a \), a parameter of form 1; \( \sigma = b \), b parameter of form 2. family = 'Simplex' simplex distribution. proposed by Barndorff-Nielsen and Jørgensen (1991)

Examples

```
library(ZOIP)
qZOIP(q=0.5, mu = 0.2, sigma = 0.5, p0 = 0.2, p1 = 0.2,family='R-S',log = FALSE)
qZOIP(q=0.5, mu = 0.2, sigma = 3, p0 = 0.2, p1 = 0.2,family='F-C',log = FALSE)
qZOIP(q=0.5, mu = 0.6, sigma = 2.4, p0 = 0.2, p1 = 0.2,family='Original',log = FALSE)
qZOIP(q=0.5, mu = 0.2, sigma = 3, p0 = 0.2, p1 = 0.2,family='Simplex',log = FALSE)

qZOIP(q=0.5, mu = 0.2, sigma = 0.5, p0 = 0, p1 = 0.2,family='R-S',log = FALSE)
qZOIP(q=0.5, mu = 0.2, sigma = 3, p0 = 0, p1 = 0.2,family='F-C',log = FALSE)
qZOIP(q=0.5, mu = 0.6, sigma = 2.4, p0 = 0, p1 = 0.2,family='Original',log = FALSE)
qZOIP(q=0.5, mu = 0.2, sigma = 3, p0 = 0, p1 = 0.2,family='Simplex',log = FALSE)
```

qZOIP

**ZOIP Distribution**

**Description**

The qZOIP function defines the quantile function of the ZOIP distribution.

**Usage**

```
qZOIP(p, mu = 0.5, sigma = 0.1, p0 = 0.08333333, p1 = 0.08333333, 
family = "R-S", lower.tail = TRUE, log.p = FALSE)
```

**Arguments**

- `p` vector of probabilities.
- `mu` vector of location parameters.
- `sigma` vector of scale parameters.
- `p0` parameter of proportion of zeros.
Parameter of proportion of ones.

choice of the parameterization or distribution, family = 'R-S' parameterization beta distribution Rigby and Stasinopoulos, 'F-C' distribution Beta parametrization Ferrari and Cribari-Neto, 'Original' Beta distribution classic parameterization, 'Simplex' simplex distribution.

logical; if TRUE (default), probabilities will be P [X <= x], otherwise, P [X > x].

logical; if TRUE, the probabilities of p will be given as log (p).

x has ZOIP distribution with shape parameters "μ", scale "σ", proportion of zeros "p0" and proportion of ones "p1", has density: 

p0 if x = 0, p1 if x = 1, (1 - p0 - p1)f(x; μ, σ) yes 0 < x < 1.

where p0 ≥ 0 represents the probability that x = 0, p1 ≥ 0 represents the probability that x = 1, 0 ≤ p0 + p1 ≤ 1 and f(x; μ, σ) represents some of the functions of probability density for proportional data, such as the beta distribution with its different parameterizations and the simplex distribution.

When family = 'R-S' uses the beta distribution with beta parameterization Rigby and Stasinopoulos (2005) which has a beta distribution function. μ is the parameter of mean and shape, plus σ is the dispersion parameter of the distribution. family = 'F-C' distribution Beta parametrization Ferrari and Cribari-Neto (2004), where σ = φ, φ is a precision parameter. family = 'Original' beta distribution original parametrization where μ = a, a parameter of form 1; σ = b, b parameter of form 2.

family = 'Simplex' simplex distribution. proposed by Barndorff-Nielsen and Jørgensen (1991)

Examples

```
library(ZOIP)
qZOIP(p=0.7, mu = 0.2, sigma = 0.5, p0 = 0.2, p1 = 0.2,family='R-S',log = FALSE)
qZOIP(p=0.7, mu = 0.2, sigma = 3, p0 = 0.2, p1 = 0.2,family='F-C',log = FALSE)
qZOIP(p=0.7, mu = 0.6, sigma = 2.4, p0 = 0.2, p1 = 0.2,family='Original',log = FALSE)
qZOIP(p=0.7, mu = 0.2, sigma = 3, p0 = 0.2, p1 = 0.2,family='Simplex',log = FALSE)
qZOIP(p=0.7, mu = 0.2, sigma = 0.5, p0 = 0, p1 = 0.2,family='R-S',log = FALSE)
qZOIP(p=0.7, mu = 0.2, sigma = 3, p0 = 0.2, p1 = 0,family='F-C',log = FALSE)
qZOIP(p=0.7, mu = 0.6, sigma = 2.4, p0 = 0, p1 = 0.2,family='Original',log = FALSE)
qZOIP(p=0.7, mu = 0.2, sigma = 3, p0 = 0, p1 = 0.2,family='Simplex',log = FALSE)
qZOIP(p=0.7, mu = 0.2, sigma = 0.5, p0 = 0, p1 = 0,family='R-S',log = FALSE)
qZOIP(p=0.7, mu = 0.2, sigma = 3, p0 = 0, p1 = 0,family='F-C',log = FALSE)
qZOIP(p=0.7, mu = 0.6, sigma = 2.4, p0 = 0, p1 = 0,family='Original',log = FALSE)
qZOIP(p=0.7, mu = 0.2, sigma = 3, p0 = 0, p1 = 0,family='Simplex',log = FALSE)
```
**Description**

The RM.ZOIP function adjusts a ZOIP regression model via maximum likelihood. The model may or may not include covariables in any of its parameters, just as it can be a bilaterally inflated model, unilaterally or without parameters of inflation.

**Usage**

```r
RM.ZOIP(formula.mu, formula.sigma = ~1, formula.p0 = ~1, formula.p1 = ~1,
data, link = c("identity", "identity", "identity", "identity"),
family = "R-S", optimizer = "nlminb")
```

**Arguments**

- `formula.mu`: Formula that defines the regression function for mu, p.e and ~ x1 + x2, it is necessary to define the response variable.
- `formula.sigma`: Formula that defines the regression function for the sigma parameter, a possible value is ~ x1, by default ~ 1.
- `formula.p0`: Formula that defines the regression function for p0, a possible value is ~ x1, by default ~ 1.
- `formula.p1`: Formula that defines the regression function for p1, a possible value is ~ x1, by default ~ 1.
- `data`: It is the data set in data.frame format where it must contain the names of the columns as they are in the formulas.
- `link`: It is a vector with the appropriate link functions for each parameter to be estimated according to the options chosen in the family and formula parameters. If the regression model does not have covariables, the identity option should be used as a link function, regardless of the value chosen in the family, possible options are logit, log, default link = c ('identity', 'identity', 'identity', 'identity').
- `family`: Choice of the parameterization or distribution, family = 'R-S' parameterization beta distribution Rigby and Stasinopoulos, 'F-C' distribution Beta parametrization Ferrari and Cribari-Neto, 'Original' Beta distribution classic parameterization, 'Simplex' simplex distribution.
- `optimizer`: Choice of the optimizer, used to find the convergence of the maximum likelihood. you can choose the value of 'nlminb' or 'optim', by default 'nlminb'.

**Examples**

```r
#Test 1-----------------------------------------------
library(ZOIP)
library(boot)
```

mod
summary(mod)

RMM.ZOIP
ZOIP regression with mixed effects

Description

function RMM.ZOIP fits a mixed ZOIP regression model with random intercepts normals in the mean and dispersion parameter, the estimation is done via maximum likelihood and the gauss-hermite adaptive quadrangle with or without pruning. the model may or may not include effects fixed in any of its parameters, just as it can be a bilaterally inflated model, unilaterally or without parameters inflated.
Usage

RMM.ZOIP(formula.mu, formula.sigma = ~1, formula.p0 = ~1, formula.p1 = ~1, data, formula.random, link = c("identity", "identity", "identity", "identity"), family = "R-S", optimizer = "nlminb", n.points = 11, pruning = TRUE)

Arguments

formula.mu Formula that defines the regression function for mu, p.e and ~ x1 + x2, it is necessary to define the response variable.

formula.sigma Formula that defines the regression function for the sigma parameter, a possible value is ~ x1, by default ~ 1.

formula.p0 Formula that defines the regression function for p0, a possible value is ~ x1, by default ~ 1.

formula.p1 Formula that defines the regression function for p1, a possible value is ~ x1, by default ~ 1.

data It is the data set in data.frame format where it must contain the names of the columns as they are in the formulas.

formula.random Formula that defines the mixed effect within the model, it should be only the random intercept that will be taken into account in the parameter of the mean and the dispersion, the admissible structure is the following formula.random = ~ 1 | G1, where G1 is the variable that indicates the groups or subjects in the model, should always be defined.

link It is a vector with the appropriate link functions for each parameter to be estimated according to the options chosen in the family and formula parameters. If the regression model does not have covariables, the identity option should be used as a link function, regardless of the value chosen in the family, possible options are logit, log, default link = c(‘identity’, ‘identity’, ‘identity’, ‘identity’).

optimizer Choice of the optimizer, used to find the convergence of the maximum likelihood. you can choose the value of ‘nlminb’ or ‘optim’, by default ‘nlminb’.

n.points Number of points to use in the approximation of the likelihood function by means of quadrature Gauss-Hermite adaptive multidimensional, by default is 11, it is recommended not to give a very large value to this parameter, because it will significantly affect the times of convergence of the model.

pruning It is a Boolean value that indicates if pruning is used or not, for the quadrature of multidimensional Adaptive Gauss-Hermite, by default it is TRUE.

Examples

library(ZOIP)
```r
N<-2
ni<-10
set.seed(12345)

rZOIP

ZOIP Distribution
Description

The rZOIP function defines the random number generating function for the ZOIP distribution.

Usage

rZOIP(n, mu = 0.5, sigma = 0.1, p0 = 0.08333333, p1 = 0.08333333, family = "R-S")

Arguments

- **n**: number of observations. If length(n) > 1, the length is taken to be the number required.
- **mu**: vector of location parameters.
- **sigma**: vector of scale parameters.
- **p0**: parameter of proportion of zeros.
- **p1**: Parameter of proportion of ones.
- **family**: choice of the parameterization or distribution, family = 'R-S' parameterization beta distribution Rigby and Stasinopoulos, 'F-C' distribution Beta parametrization Ferrari and Cribari-Neto, 'Original' Beta distribution classic parameterization, 'Simplex' simplex distribution.

Details

x has ZOIP distribution with shape parameters "mu", scale "sigma", proportion of zeros "p0" and proportion of ones "p1", has density: p0 if x = 0, p1 if x = 1, (1 - p0 - p1) f(x; µ, σ) yes 0 < x < 1.

where p0 ≥ 0 represents the probability that x = 0, p1 ≥ 0 represents the probability that x = 1, 0 ≤ p0 + p1 ≤ 1 and f(x; µ, σ) represents some of the functions of probability density for proportional data, such as the beta distribution with its different parameterizations and the simplex distribution.

When family = 'R-S' uses the beta distribution with beta parameterization Rigby and Stasinopoulos (2005) which has a beta distribution function. µ is the parameter of mean and shape, plus σ is the dispersion parameter of the distribution. family = 'F-C' distribution Beta parametrization Ferrari and Cribari-Neto (2004), where σ = φ, φ is a precision parameter. family = 'Original' beta distribution original parameterization where µ = a, a parameter of form 1; σ = b, b parameter of form 2.

family = 'Simplex' simplex distribution. proposed by Barndorff-Nielsen and Jørgensen (1991)

Examples

```
library(ZOIP)
a1<rZOIP(n=1000, mu = 0.2, sigma = 0.5, p0 = 0.2, p1 = 0.2,family='R-S')

summary.ZOIP

Description

Summarize a ZOIP model.

Usage

```r
## S3 method for class 'ZOIP'
summary(object, ...)
```

Arguments

- `object` An object of class ZOIP.
- `...` other arguments.

Examples

```r
# Test
library(ZOIP)
library(boot)
n <- 1000
x1 <- stats::runif(n)
x2 <- stats::runif(n)
```
b1<-0.3
b2<-0.5
b3<-0.9
sigma_i<-boot::inv.logit(b1+b2*x1+b3*x2)

c1<-0.2
c2<-1
c3<-0.1
mu_i<-boot::inv.logit(c1+c2*x1)

d1<-0.07
p0_i<-rep(d1,length(n))

e1<-0.02
e2<-4
pl_i<-boot::inv.logit(e1+e2*x2)

param<-cbind(mu_i,sigma_i,p0_i,pl_i)

system.time(y_i<-apply(param,1,function(x){rZOIP(1,mu=x[1],sigma=x[2],
p0=x[3],pl=x[4],family='R-S')}))
data<-as.data.frame(cbind(y_i,x1,x2))

formula.mu=y_i-x1
formula.sigma=x1+x2
formula.p0=-1
formula.pl=x1+x2
link=c('logit','logit','identity','logit')
family='R-S'
mod<-RM.ZOIP(formula.mu=formula.mu,formula.sigma=formula.sigma,formula.p0=formula.p0,
formula.pl=formula.pl,data=data,link=link,family=family)
summary(mod)

summary.ZOIPM

Description
Summarize a ZOIP model mixed.

Usage
## S3 method for class 'ZOIPM'
summary(object, ...)

Arguments

object An object of class ZOIPM.
...
other arguments.
Examples

```
library(ZOIP)

N<-2
ni<-10
set.seed(12345)
Ciudad <- rep(1:N, each=ni)
Total_mora<-rexp(N*ni,rate=1)
set.seed(12345)
b0i <- rep(rnorm(n=N, sd=0.5), each=ni)
set.seed(12345)
b1i <- rep(rnorm(n=N, sd=0.4), each=ni)

neta <- (-1.13+b0i)+0.33*Total_mora
neta2<-(0.33+b1i)+0.14*Total_mora

mu <- 1 / (1 + exp(-neta))
sigma <- 1 / (1 + exp(-neta2))
p0 <- 0.05
p1 <- 0.05

mu[mu==1] <- 0.999
mu[mu==0] <- 0.001

sigma[sigma==1] <- 0.999
sigma[sigma==0] <- 0.001
family<-‘R-S’
set.seed(12345)
Y <- rZOIP(n=length(mu), mu = mu, sigma = sigma ,p0=p0,p1=p1,family=family)
data_sim<-data.frame(Y,Total_mora,Ciudad)
n.points <- 3
pruning <- TRUE

formula.mu=Y~Total_mora
formula.sigma=~Total_mora
formula.p0=~1
formula.p1=~1
formula.random= ~ 1 | Ciudad
link=c('logit','logit','identity','identity')
optimizer<-'nlminb'

mod<-RMM.ZOIP(formula.mu=formula.mu,formula.sigma=formula.sigma,formula.p0=formula.p0,
    formula.p1=formula.p1,data=data_sim,formula.random=formula.random,link=link,
    family=family,optimizer=optimizer,n.points=n.points,pruning=pruning)

summary(mod)
