

# Package ‘coalitions’

June 30, 2021

**Type** Package

**Title** Bayesian “Now-Cast” Estimation of Event Probabilities in  
Multi-Party Democracies

**Version** 0.6.20

**Date** 2021-06-21

**Maintainer** Andreas Bender <bender.at.R@gmail.com>

**Description** An implementation of a Bayesian framework for the opinion poll  
based estimation of event probabilities in multi-party electoral systems  
(Bender and Bauer (2018) <[doi:10.21105/joss.00606](https://doi.org/10.21105/joss.00606)>).

**Depends** R (>= 3.2.1)

**Imports** checkmate, gtools, rvest, xml2, jsonlite, RCurl, rlang,  
magrittr, lubridate, stringr, tidyr (>= 1.0.0), purrr (>  
0.2.2), dplyr (> 0.5.0), ggplot2, tibble (>= 3.0.0)

**Suggests** testthat, covr,

**Encoding** UTF-8

**License** MIT + file LICENSE

**URL** <https://adibender.github.io/coalitions/>

**BugReports** <https://github.com/adibender/coalitions/issues>

**RoxygenNote** 7.1.1

**LazyData** true

**NeedsCompilation** no

**Author** Andreas Bender [aut, cre] (<<https://orcid.org/0000-0001-5628-8611>>),  
Alexander Bauer [aut] (<<https://orcid.org/0000-0003-3495-5131>>)

**Repository** CRAN

**Date/Publication** 2021-06-30 08:40:06 UTC

calculate_prob	<i>Calculate coalition probability from majority table</i>
----------------	--

---

### Description

Given a table with simulations in the rows and coalitions in the columns, this function returns the coalition probabilities for a specified coalition, by default excluding superior coalitions first

### Usage

```
calculate_prob(majority_df, coalition, exclude_superior = TRUE, ...)
```

### Arguments

majority_df	A data frame containing logical values indicating if the coalitions (columns) have a majority (rows).
coalition	The coalition of interest for which superior coalitions will be obtained by <a href="#">get_superior</a> .
exclude_superior	Logical. If TRUE, superior coalitions will be excluded, otherwise total coalition probabilities will be returned. Usually it makes sense to exclude superior coalitions.
...	Further arguments passed to <a href="#">get_superior</a>

**Examples**

```
test_df <- data.frame(
  cdu          = c(rep(FALSE, 9), TRUE),
  cdu_fdp      = c(rep(FALSE, 8), TRUE, TRUE),
  cdu_fdp_greens = c(TRUE, TRUE, rep(FALSE, 6), TRUE, TRUE))
calculate_prob(test_df, "cdu_fdp_greens") # exclude_superior defaults to TRUE
calculate_prob(test_df, "cdu_fdp_greens", exclude_superior=FALSE)
```

---

calculate_probs	<i>Calculate coalition probabilities for multiple coalitions</i>
-----------------	--

---

**Description**

Given a table with simulations in the rows and coalitions in the columns, this function returns the coalition probabilities for a specified coalition, by default excluding superior coalitions first

**Usage**

```
calculate_probs(majority_df, coalitions, exclude_superior = TRUE, ...)
```

**Arguments**

majority_df	A data frame containing logical values indicating if the coalitions (columns) have a majority (rows).
coalitions	A list of coalitions for which coalition probabilities should be calculated. Each list entry must be a vector of party names. Those names need to correspond to the names in majority_df.
exclude_superior	Logical. If TRUE, superior coalitions will be excluded, otherwise total coalition probabilities will be returned. Usually it makes sense to exclude superior coalitions.
...	Further arguments passed to <a href="#">get_superior</a>

**See Also**

[calculate\\_prob](#)

**Examples**

```
test_df <- data.frame(
  cdu          = c(rep(FALSE, 9), TRUE),
  cdu_fdp      = c(rep(FALSE, 8), TRUE, TRUE),
  cdu_fdp_greens = c(TRUE, TRUE, rep(FALSE, 6), TRUE, TRUE))
calculate_probs(test_df, list("cdu", "cdu_fdp", "cdu_fdp_greens"))
calculate_probs(test_df, list("cdu", "cdu_fdp", "cdu_fdp_greens"), exclude_superior=FALSE)
```

---

collapse\_parties      *Transform surveys in long format*

---

**Description**

Given a data frame containing multiple surveys (one row per survey), transforms the data into long format with one row per party.

**Usage**

```
collapse_parties(  
  surveys,  
  parties = c("cdu", "spd", "greens", "fdp", "left", "pirates", "fw", "afd", "others")  
)
```

**Arguments**

surveys      A data frame with one survey per row.  
parties      A character vector containing names of parties to collapse.

**Value**

Data frame in long format

**Examples**

```
## Not run:  
emnid <- scrape_wahlrecht()  
emnid.long <- collapse_parties(emnid)  
  
## End(Not run)
```

---

dHondt      *Seat Distribution by D'Hondt*

---

**Description**

Calculates number of seats for the respective parties according to the method of d'Hondt.

**Usage**

```
dHondt(votes, parties, n_seats = 183)
```

**Arguments**

votes	Number of votes per party.
parties	Names of parties (must be same length as votes).
n_seats	Number of seats in parliament. Defaults to 183 (seats in Austrian parliament).

**Value**

A numeric vector containing the seats of all parties after redistribution via D'Hondt

**See Also**

[sls](#)

**Examples**

```
library(coalitions)
library(dplyr)
# get the latest survey for a sample of German federal election polls
surveys <- get_latest(surveys_sample) %>% tidyr::unnest("survey")
# calculate the seat distribution based on D'Hondt for a parliament with 300 seats
dHondt(surveys$votes, surveys$party, n_seats = 300)
```

---

draw\_from\_posterior     *Draw random numbers from posterior distribution*

---

**Description**

Draw random numbers from posterior distribution

**Usage**

```
draw_from_posterior(
  survey,
  nsim = 10000,
  seed = as.numeric(now()),
  prior = NULL,
  correction = NULL
)
```

**Arguments**

survey	survey object as returned by <code>as_survey</code> or <code>getSurveys</code>
nsim	number of simulations
seed	sets seed
prior	optional prior information. Defaults to 1/2 (Jeffrey's prior).

**correction** A positive number. If not NULL, each sample from the Dirichlet distribution will be additionally "corrected" by a random number from  $U(-1 \cdot \text{correction}, 1 \cdot \text{correction})$ . This can be used to introduce extra variation which might be useful due to rounding errors from reported survey results (or add an additional source of variation in general).

### Value

data.frame containing random draws from Dirichlet distribution which can be interpreted as election results.

### See Also

[as\\_survey](#)

---

<code>get_probabilities</code>	<i>Wrapper for calculation of coalition probabilities from survey</i>
--------------------------------	---

---

### Description

Given a table with simulations in the rows and coalitions in the columns, this function returns the coalition probabilities for a specified coalition, by default excluding superior coalitions first

### Usage

```
get_probabilities(
  x,
  coalitions = list(c("cdu"), c("cdu", "fdp"), c("cdu", "fdp", "greens"), c("spd"),
    c("spd", "left"), c("spd", "left", "greens")),
  nsim = 1e+05,
  distrib.fun = sls,
  seats_majority = 300L,
  seed = as.numeric(now()),
  correction = NULL
)
```

### Arguments

**x** A table containing one row per survey and survey information in long format in a separate column named `survey`.

**coalitions** A list of coalitions for which coalition probabilities should be calculated. Each list entry must be a vector of party names. Those names need to correspond to the names in `majority_df`.

**nsim** number of simulations

**distrib.fun** Function to calculate seat distribution. Defaults to [sls](#) (Sainte-Lague/Schepers).

**seats\_majority** The number of seats needed to obtain majority.

seed	sets seed
correction	A positive number. If not NULL, each sample from the Dirichlet distribution will be additionally "corrected" by a random number from $U(-1*\text{correction}, 1*\text{correction})$ . This can be used to introduce extra variation which might be useful due to rounding errors from reported survey results (or add an additional source of variation in general).

**See Also**

[calculate\\_prob](#)

**Examples**

```
library(coalitions)
library(dplyr)
# get the latest survey for a sample of German federal election polls
surveys <- get_latest(surveys_sample)
# calculate probabilities for two coalitions
probs <- get_probabilities(surveys,
                           coalitions = list(c("cdu", "fdp"),
                                              c("spd", "left", "greens")),
                           nsim = 100) # ensure fast runtime with only 100 simulations
probs %>% tidyr::unnest("probabilities")
```

---

get\_seats

---

*Calculate seat distribution from draws from posterior*

---

**Description**

Calculate seat distribution from draws from posterior

**Usage**

```
get_seats(
  dirichlet.draws,
  survey,
  distrib.fun = sls,
  samplesize = NULL,
  hurdle = 0.05,
  others = "others",
  ...
)
```

**Arguments**

dirichlet.draws	Matrix containing random draws from posterior.
survey	The actual survey results on which <code>dirichlet.draws</code> were based on.

distrib.fun	Function to calculate seat distribution. Defaults to <code>sls</code> (Sainte-Lague/Schepers).
samplesize	Number of individuals participating in the survey.
hurdle	The percentage threshold which has to be reached by a party to enter the parliament.
others	A string indicating the name under which parties not listed explicitly are subsumed.
...	Further arguments passed to <code>distrib.fun</code> .

**Value**

A data frame containing seat distributions for each simulation in `dirichlet.draws`

**See Also**

[draw\\_from\\_posterior](#), [sls](#), [dHondt](#)

**Examples**

```
library(coalitions)
library(dplyr)
# get the latest survey for a sample of German federal election polls
surveys <- get_latest(surveys_sample)
# simulate 100 seat distributions
surveys <- surveys %>% mutate(draws = purrr::map(survey, draw_from_posterior, nsim = 100),
                             seats = purrr::map2(draws, survey, get_seats))
surveys$seats
```

---

get\_surveys

*Scrape surveys from all pollsters*

---

**Description**

Given a specific date, extract the survey from this date or the last one before this date.

**Usage**

```
get_surveys(country = c("DE", "AT"))

get_surveys_by()

get_surveys_rp()

get_surveys_nds()

get_surveys_saxony()

get_surveys_brb()
```

```
get_surveys_thuringen()

get_latest(surveys = NULL, max_date = Sys.Date())
```

### Arguments

country	Choose country from which surveys should be scraped. Currently "DE" (Germany) and "AT" (Austria) are supported.
surveys	If provided, latest survey will be obtained from this object, otherwise calls <a href="#">get_surveys</a> .
max_date	Specifies the date, relative to which latest survey will be searched for. Defaults to Sys.Date.

### Value

Nested tibble. When fully unnested, the dataset contains the following columns:

**pollster** Character name of the polling institute.

**date** Publication date of the poll.

**start, end** Start and end date of the field period, i.e. the dates during which the poll was conducted.

**respondents** Number of respondents in the poll.

**party** Character name of an individual party.

**percent** Percentage of respondents that chose the party. Given in percentage points, i.e. 38% is given as 38.

**votes** Number of respondents that chose the party.

### Examples

```
## Not run:
library(coalitions)
# scrape data for the German federal election
# get_surveys()

## End(Not run)
library(coalitions)
### Scrape the newest poll for the German federal election
# Possibility 1: Calling get_latest without arguments scrapes surveys from the web
# Possibility 2: Use get_latest() on an already scraped dataset
surveys <- get_latest(surveys_sample)
```

---

 gg\_survey

*Plot voter shares observed in one survey*

---

### Description

Bar chart of the raw voter shares observed in one survey. Additionally to plotting positive voter shares, the function can be used to plot party-specific differences (e.g. between a survey and the election result), including negative numbers.

### Usage

```
gg_survey(data, colors = NULL, labels = NULL, annotate_bars = TRUE, hurdle = 5)
```

### Arguments

data	Scraped dataset containing one row per party in the column party and the observed voter share in the column percent
colors	Named vector containing party colors. If NULL (default) tries to guess color based on party names, gray otherwise.
labels	Named vector containing party labels. If NULL (default) tries to guess party names from data.
annotate_bars	If TRUE (default) bars are annotated by the respective vote share (percentage).
hurdle	Hurdle for single parties to get into the parliament, e.g. '5' for '5%'. If set to NULL no horizontal line is plotted. The horizontal line can be suppressed using NULL.

### Examples

```
library(tidyr)
library(dplyr)
library(coalitions)

survey <- surveys_sample$surveys[[1]]$survey[[1]]

gg_survey(survey)
```

---

 hare\_niemeyer

*Seat Distribution by Hare/Niemeyer*

---

### Description

Calculates number of seats for the respective parties that have received more than hurdle percent of votes (according to the method of Hare/Niemeyer)

**Usage**

```
hare_niemeyer(votes, parties, n_seats = 183)
```

**Arguments**

votes            Number of votes per party.  
parties           Names of parties (must be same length as votes).  
n\_seats           Number of seats in parliament. Defaults to 183 (seats in Austrian parliament).

**Value**

A data.frame containing parties above the hurdle and the respective seats/percentages after redistribution via Hare/Niemeyer

**See Also**

[sls](#)

**Examples**

```
library(coalitions)
library(dplyr)
# get the latest survey for a sample of German federal election polls
surveys <- get_latest(surveys_sample) %>% tidyr::unnest("survey")
# calculate the seat distribution based on Hare/Niemeyer for a parliament with 300 seats
hare_niemeyer(surveys$votes, surveys$party, n_seats = 300)
```

---

have_majority	<i>Do coalitions have a majority</i>
---------------	--------------------------------------

---

**Description**

Do coalitions have a majority

**Usage**

```
have_majority(
  seats_tab,
  coalitions = list(c("cdu"), c("cdu", "fdp"), c("cdu", "fdp", "greens"), c("spd"),
    c("spd", "left"), c("spd", "left", "greens")),
  seats_majority = 300L,
  collapse = "_"
)
```

**Arguments**

seats_tab	A data frame containing number of seats obtained by a party. Must have columns party and seats.
coalitions	A list of coalitions for which coalition probabilities should be calculated. Each list entry must be a vector of party names. Those names need to correspond to the names in majority_df.
seats_majority	The number of seats needed to obtain majority.
collapse	Character string passed to base::paste.

**Examples**

```
library(coalitions)
library(dplyr)
library(purrr)
# get the latest survey for a sample of German federal election polls
surveys <- get_latest(surveys_sample)
# check for majorities of two coalitions
coals <- list(c("cdu", "fdp"),
             c("spd", "left", "greens"))
# only use 100 simulations for a fast runtime
surveys <- surveys %>% mutate(draws = map(survey, draw_from_posterior, nsim = 100),
                             seats = map2(draws, survey, get_seats),
                             majorities = map(seats, have_majority, coalitions = coals))

surveys$majorities
```

---

party_colors_de	<i>Colors for German parties</i>
-----------------	----------------------------------

---

**Description**

A vector of colors associated with German parties.

**Usage**

```
party_colors_de
```

**Format**

A named character vector. Names indicate parties. Values contain color strings for the respective parties

---

party_labels_de	<i>Labels for German parties</i>
-----------------	----------------------------------

---

**Description**

A vector of labels associated with German parties.

**Usage**

```
party_labels_de
```

**Format**

A named character vector. Names indicate parties. Values contain party names suitable for plot labels.

---

pool_surveys	<i>Obtain pooled survey during specified period</i>
--------------	---

---

**Description**

Per default, pools surveys starting from current date and going 14 days back. For each pollster within the defined time-frame, only the most recent survey is used.

**Usage**

```
pool_surveys(
  surveys,
  last_date = Sys.Date(),
  pollsters = c("allensbach", "emnid", "forsa", "fgw", "gms", "infratest", "dimap",
    "infratestdimap", "insa"),
  period = 14,
  period_extended = NA,
  corr = 0.5,
  weights = NULL
)
```

**Arguments**

surveys	A tibble containing survey results for multiple pollsters as returned by <a href="#">get_surveys</a> .
last_date	Only surveys in the time-window from last_date to last_date - period will be considered for each pollster. Defaults to current date.
pollsters	Character vector of pollsters that should be considered for pooling.
period	See last_date argument.

period_extended	Optional. If specified, all surveys in the time-window from last_date - period_extended to last_date - period will also be considered for each pollster, but only after down-weighting them by halving their true sample size.
corr	Assumed correlation between surveys (of different pollsters). Defaults to 0.5.
weights	Additional weights for individual surveys.

### Examples

```
library(coalitions)
library(dplyr)
latest <- get_latest(surveys_sample)
pool_surveys(surveys_sample, last_date=as.Date("2017-09-02"))
```

---

redistribute	<i>Calculate percentage of votes/seats after excluding parties with votes &lt; hurdle</i>
--------------	---

---

### Description

Calculate percentage of votes/seats after excluding parties with votes < hurdle

### Usage

```
redistribute(survey, hurdle = 0.05, others = "others", epsilon = 1e-05)
```

### Arguments

survey	The actual survey results on which <code>dirichlet.draws</code> were based on.
hurdle	The percentage threshold which has to be reached by a party to enter the parliament.
others	A string indicating the name under which parties not listed explicitly are subsumed.
epsilon	Percentages should add up to 1. If they do not, within accuracy of epsilon, an error is thrown.

### See Also

[get\\_seats](#), [sls](#)

**Examples**

```

library(coalitions)
library(dplyr)
# get the latest survey for a sample of German federal election polls
surveys <- get_latest(surveys_sample)
# redistribute the shares of 'others' parties and parties with a share of under 5%
surveys <- surveys %>% mutate(survey_redist = purrr::map(survey, redistribute))
surveys$survey # results before redistribution
surveys$survey_redist # results after redistribution

```

---

scrape_austria	<i>Import Austrian survey results</i>
----------------	---------------------------------------

---

**Description**

Reads JSON file from neuwal.com and performs some preprocessing to bring data into standardized format. Returns a nested tibble.

**Usage**

```

scrape_austria(
  address = "https://neuwal.com/wahlumfragen/data/neuwal-wahlumfragen-user.json"
)

```

**Arguments**

address            URL of the JSON file.

---

scrape_wahlrecht	<i>Scrape surveys for German general election</i>
------------------	---

---

**Description**

Scrapes survey tables and performs sanitation to output tidy data

**Usage**

```

scrape_wahlrecht(
  address = "https://www.wahlrecht.de/umfragen/emnid.htm",
  parties = c("CDU", "SPD", "GRUENE", "FDP", "LINKE", "PIRATEN", "FW", "AFD",
             "SONSTIGE")
)

scrape_by(
  address = "https://www.wahlrecht.de/umfragen/landtage/bayern.htm",
  parties = c("CSU", "SPD", "GRUENE", "FDP", "LINKE", "PIRATEN", "FW", "AFD",

```

```

    "SONSTIGE")
  )

scrape_rp(
  address = "https://www.wahlrecht.de/umfragen/landtage/rheinland-pfalz.htm",
  parties = c("CDU", "SPD", "GRUENE", "FDP", "LINKE", "AFD", "FW", "SONSTIGE"),
  ind_row_remove = -c(1:3)
)

scrape_ltw(
  address = "https://www.wahlrecht.de/umfragen/landtage/niedersachsen.htm",
  parties = c("CDU", "SPD", "GRUENE", "FDP", "LINKE", "PIRATEN", "FW", "AFD",
    "SONSTIGE"),
  ind_row_remove = -c(1:2)
)

```

### Arguments

address            http-address from which tables should be scraped.

parties            A character vector containing names of parties to collapse.

ind\_row\_remove    Negative vector of rows that will be skipped at the beginning.

### Examples

```

## Not run:
library(coalitions)
library(dplyr)
# select a polling agency from .pollster_df that should be scraped ...
coalitions:::.pollster_df
# ... here we choose Forsa
address <- coalitions:::.pollster_df %>% filter(pollster == "forsa") %>% pull(address)
scrape_wahlrecht(address = address) %>% slice(1:5)

## End(Not run)
## Not run:
# Niedersachsen
scrape_ltw() %>% slice(1:5)
# Hessen
scrape_ltw("https://www.wahlrecht.de/umfragen/landtage/hessen.htm", ind_row_remove=-c(1)) %>%
  slice(1:5)

## End(Not run)

```

**Description**

Calculates number of seats for the respective parties that have received more than 5% of votes (according to the method of Sainte-Lague/Schepers, see <https://www.wahlrecht.de/verfahren/rangmasszahlen.html>).

**Usage**

```
sls(votes, parties, n_seats = 598L)
```

**Arguments**

votes	A numeric vector giving the redistributes votes
parties	A character vector indicating the names of parties with respective votes.
n_seats	The total number of seats that can be assigned to the different parties.

**Value**

A numeric vector giving the number of seats each party obtained.

**See Also**

[dHondt](#)

**Examples**

```
library(coalitions)
library(dplyr)
# get the latest survey for a sample of German federal election polls
surveys <- get_latest(surveys_sample) %>% tidyr::unnest("survey")
# calculate the seat distribution based on Sainte-Lague/Schepers for a parliament with 300 seats
sls(surveys$votes, surveys$party, n_seats = 300)
```

---

surveys_sample	<i>Sample of selected surveys</i>
----------------	-----------------------------------

---

**Description**

A data set with surveys from seven different pollsters, three surveys per pollster. Surveys report support for different parties in the running for the German Bundestag prior to the 2017 election.

**Usage**

```
surveys_sample
```

**Format**

A nested data frame with 7 rows and 2 columns:

**institute** name of the pollster  
**surveys** a list of data frames, each containing one survey

**Source**

<https://www.wahlrecht.de/>

---

try_readHTML	<i>Try call of read_html that throws an error if the url cannot be resolved</i>
--------------	---

---

**Description**

Try call of read\_html that throws an error if the url cannot be resolved

**Usage**

```
try_readHTML(url)
```

**Arguments**

url            http-address that should be scraped.
