Package ‘covr’

September 16, 2020

Encoding UTF-8

Title Test Coverage for Packages

Version 3.5.1

Description Track and report code coverage for your package and (optionally) upload the results to a coverage service like ‘Codecov’ <https://codecov.io> or ‘Coveralls’ <https://coveralls.io>. Code coverage is a measure of the amount of code being exercised by a set of tests. It is an indirect measure of test quality and completeness. This package is compatible with any testing methodology or framework and tracks coverage of both R code and compiled C/C++/FORTRAN code.

BugReports https://github.com/r-lib/covr/issues

Depends R (>= 3.1.0), methods

Imports digest, stats, utils, jsonlite, rex, httr, crayon, withr (>= 1.0.2), yaml

Suggests R6, curl, knitr, rmarkdown, htmltools, DT (>= 0.2), testthat, rlang, rstudioapi (>= 0.2), xml2 (>= 1.0.0), parallel, memoise, mockery

License GPL-3

LazyData true

VignetteBuilder knitr

RoxygenNote 7.1.0

covr-package

Description

covr tracks and reports code coverage for your package and (optionally) upload the results to a coverage service like 'Codecov' https://codecov.io or 'Coveralls' https://coveralls.io. Code coverage is a measure of the amount of code being exercised by a set of tests. It is an indirect measure of test quality and completeness. This package is compatible with any testing methodology or framework and tracks coverage of both R code and compiled C/C++/FORTRAN code.

Details

A coverage report can be used to inspect coverage for each line in your package. Using report() requires the additional dependencies DT and htmltools.

# If run with no arguments `report()` implicitly calls `package_coverage()`

report()

---

```
azure(  
  ...,  
  coverage = package_coverage(..., quiet = quiet),  
  filename = "coverage.xml",  
  quiet = TRUE  
)
```

Description

Run covr on a package and output the result so it is available on Azure Pipelines

Usage

Run covr on a package and output the result so it is available on Azure Pipelines

Usage

```r
azure(  
  ...,  
  coverage = package_coverage(..., quiet = quiet),  
  filename = "coverage.xml",  
  quiet = TRUE  
)
```

Arguments

... arguments passed to `package_coverage()`

coverage an existing coverage object to submit, if NULL, `package_coverage()` will be called with the arguments from ...

filename the name of the Cobertura XML file

quiet if FALSE, print the coverage before submission.
codecov

Run covr on a package and upload the result to codecov.io

Description

Run covr on a package and upload the result to codecov.io

Usage

codecov(
  ..., 
  coverage = NULL,
  base_url = "https://codecov.io",
  token = NULL,
  commit = NULL,
  branch = NULL,
  pr = NULL,
  flags = NULL,
  quiet = TRUE
)

Arguments

  ... arguments passed to package_coverage()
  coverage an existing coverage object to submit, if NULL, package_coverage() will be
             called with the arguments from ...
  base_url Codecov url (change for Enterprise)
  token a codecov upload token, if NULL then following external sources will be checked
         in this order:
             1. the environment variable ‘CODECOV_TOKEN’. If it is empty, then
             2. package will look at directory of the package for a file codecov.yml. File
                must have codecov section where field token is set to a token that will be
                used.
  commit explicitly set the commit this coverage result object corresponds to. Is looked
            up from the service or locally if it is NULL.
  branch explicitly set the branch this coverage result object corresponds to, this is looked
           up from the service or locally if it is NULL.
  pr explicitly set the pr this coverage result object corresponds to, this is looked up
        from the service if it is NULL.
  flags A flag to use for this coverage upload see https://docs.codecov.io/docs/
         flags for details.
  quiet if FALSE, print the coverage before submission.
Examples

## Not run:
codecov(path = "test")

## End(Not run)

code_coverage  

Calculate coverage of code directly

Description

This function is useful for testing, and is a thin wrapper around file_coverage() because parseData is not populated properly unless the functions are defined in a file.

Usage

code_coverage(
  source_code,
  test_code,
  line_exclusions = NULL,
  function_exclusions = NULL,
  ...
)

Arguments

  source_code  A character vector of source code
  test_code    A character vector of test code
  line_exclusions
                a named list of files with the lines to exclude from each file.
  function_exclusions
                a vector of regular expressions matching function names to exclude. Example
                print\. to match print methods.
  ...
                Additional arguments passed to file_coverage()

coverage_to_list  

Convert a coverage dataset to a list

Description

Convert a coverage dataset to a list

Usage

coverage_to_list(x = package_coverage())
coveralls

Arguments

\[ x \] a coverage dataset, defaults to running `package_coverage()`. 

Value

A list containing coverage result for each individual file and the whole package

coveralls \hspace{1.5cm} Run covr on a package and upload the result to coveralls

Description

Run covr on a package and upload the result to coveralls

Usage

```r
coveralls( 
  ..., 
  coverage = NULL, 
  repo_token = Sys.getenv("COVERALLS_TOKEN"), 
  service_name = Sys.getenv("CI_NAME", "travis-ci"), 
  quiet = TRUE 
)
```

Arguments

\[ ... \] arguments passed to `package_coverage()`

coverage an existing coverage object to submit, if NULL, `package_coverage()` will be called with the arguments from ... 

repo_token The secret repo token for your repository, found at the bottom of your repository's page on Coveralls. This is useful if your job is running on a service Coveralls doesn't support out-of-the-box. If set to NULL, it is assumed that the job is running on travis-ci

service_name the CI service to use, if environment variable ‘CI_NAME’ is set that is used, otherwise ‘travis-ci’ is used.

quiet if FALSE, print the coverage before submission.
environment_coverage  
*Calculate coverage of an environment*

**Description**

Calculate coverage of an environment

**Usage**

```r
environment_coverage(
  env = parent.frame(),
  test_files,
  line_exclusions = NULL,
  function_exclusions = NULL
)
```

**Arguments**

- `env`  
The environment to be instrumented.
- `test_files`  
Character vector of test files with code to test the functions
- `line_exclusions`  
a named list of files with the lines to exclude from each file.
- `function_exclusions`  
a vector of regular expressions matching function names to exclude. Example `print\s*` to match print methods.

---

**exclusions  
Exclusions**

**Description**

covr supports a couple of different ways of excluding some or all of a file.

**Line Exclusions**

The `line_exclusions` argument to `package_coverage()` can be used to exclude some or all of a file. This argument takes a list of filenames or named ranges to exclude.

**Function Exclusions**

Alternatively `function_exclusions` can be used to exclude R functions based on regular expression(s). For example `print\s*` can be used to exclude all the print methods defined in a package from coverage.
Exclusion Comments

In addition you can exclude lines from the coverage by putting special comments in your source code. This can be done per line or by specifying a range. The patterns used can be specified by the `exclude_pattern`, `exclude_start`, `exclude_end` arguments to `package_coverage()` or by setting the global options `covr.exclude_pattern`, `covr.exclude_start`, `covr.exclude_end`.

Examples

```r
## Not run:
# exclude whole file of R/test.R
package_coverage(exclusions = "R/test.R")

# exclude lines 1 to 10 and 15 from R/test.R
package_coverage(line_exclusions = list("R/test.R" = c(1:10, 15)))

# exclude lines 1 to 10 from R/test.R, all of R/test2.R
package_coverage(line_exclusions = list("R/test.R" = 1:10, "R/test2.R"))

# exclude all print and format methods from the package.
package_coverage(function_exclusions = c("print\:\.", "format\:\."))

# single line exclusions
f1 <- function(x) {
  x + 1 # nocov
}

# ranged exclusions
f2 <- function(x) { # nocov start
  x + 2
} # nocov end

## End(Not run)
```

**Description**

The files in `source_files` are first sourced into a new environment to define functions to be checked. Then they are instrumented to track coverage and the files in `test_files` are sourced.

**Usage**

```r
file_coverage(  
  source_files,  
  test_files,  
  line_exclusions = NULL,  
  function_exclusions = NULL,  
  parent_env = parent.frame()
)
```
function_coverage

Arguments

source_files Character vector of source files with function definitions to measure coverage
test_files Character vector of test files with code to test the functions
line_exclusions a named list of files with the lines to exclude from each file.
function_exclusions a vector of regular expressions matching function names to exclude. Example print\ to match print methods.
parent_env The parent environment to use when sourcing the files.

file_report A coverage report for a specific file

Description

A coverage report for a specific file

Usage

file_report(
x = package_coverage(),
file = NULL,
out_file = file.path(tempdir(), paste0(get_package_name(x), "-file-report.html")),
browse = interactive()
)

Arguments

x a coverage dataset, defaults to running package_coverage().
file The file to report on, if NULL, use the first file in the coverage output.
out_file The output file
browse whether to open a browser to view the report.

function_coverage Calculate test coverage for a specific function.

Description

Calculate test coverage for a specific function.

Usage

function_coverage(fun, code = NULL, env = NULL, enc = parent.frame())
**Arguments**

- **fun**: name of the function.
- **code**: expressions to run.
- **env**: environment the function is defined in.
- **enc**: the enclosing environment which to run the expressions.

---

**gitlab**

*Run covr on package and create report for GitLab*

---

**Description**

Use internal GitLab static pages to publish package coverage. Creates a local covr report in a package subdirectory. Uses the pages GitLab job to publish the report.

**Usage**

```r
gitlab(..., coverage = NULL, file = "public/coverage.html", quiet = TRUE)
```

**Arguments**

- **...**: arguments passed to `package_coverage()`
- **coverage**: an existing coverage object to submit, if NULL, `package_coverage()` will be called with the arguments from ... .
- **file**: The report filename.
- **quiet**: if FALSE, print the coverage before submission.

---

**in_covr**

*Determine if code is being run in covr*

---

**Description**

Covr functions set the environment variable `R_COVR` when they are running. `in_covr()` returns TRUE if this environment variable is set and FALSE otherwise.

**Usage**

```r
in_covr()
```

**Examples**

```r
if (require(testthat)) {
  testthat::skip_if(in_covr())
}
```
package_coverage

Calculate test coverage for a package

Description

This function calculates the test coverage for a development package on the path. By default it runs only the package tests, but it can also run vignette and example code.

Usage

package_coverage(
  path = ".",
  type = c("tests", "vignettes", "examples", "all", "none"),
  combine_types = TRUE,
  relative_path = TRUE,
  quiet = TRUE,
  clean = TRUE,
  line_exclusions = NULL,
  function_exclusions = NULL,
  code = character(),
  ...,
  exclusions,
  pre_clean = TRUE
)

Arguments

path file path to the package.
type run the package ‘tests’, ‘vignettes’, ‘examples’, ‘all’, or ‘none’. The default is ‘tests’.
combine_types If TRUE (the default) the coverage for all types is simply summed into one coverage object. If FALSE separate objects are used for each type of coverage.
relative_path whether to output the paths as relative or absolute paths.
quiet whether to load and compile the package quietly, useful for debugging errors.
clean whether to clean temporary output files after running, mainly useful for debugging errors.
line_exclusions a named list of files with the lines to exclude from each file.
function_exclusions a vector of regular expressions matching function names to exclude. Example print\\. to match print methods.
code A character vector of additional test code to run.
... Additional arguments passed to tools::testInstalledPackage().
exclusions ‘Deprecated’, please use ‘line_exclusions’ instead.
pre_clean whether to delete all objects present in the src directory before recompiling.
Details

This function uses `tools::testInstalledPackage()` to run the code, if you would like to test your package in another way you can set type = "none" and pass the code to run as a character vector to the code parameter.

Parallelized code using `parallel`'s `mcparallel()` needs to use a patched `parallel:::mcexit`. This is done automatically if the package depends on `parallel`, but can also be explicitly set using the environment variable `COVR_FIX_PARALLEL_MCEXIT` or the global option `covr.fix_parallel_mcexit`.

See Also

`exclusions()` For details on excluding parts of the package from the coverage calculations.

---

**percent_coverage**

Provide percent coverage of package

---

Description

Calculate the total percent coverage from a coverage result object.

Usage

```r
percent_coverage(x, ...)
```

Arguments

- `x`: the coverage object returned from `package_coverage()`
- `...`: additional arguments passed to `tally_coverage()`

Value

The total percentage as a numeric(1).

---

**print.coverage**

Print a coverage object

---

Description

Print a coverage object

Usage

```r
## S3 method for class 'coverage'
print(x, group = c("filename", "functions"), by = "line", ...)
```
Arguments

  x  the coverage object to be printed
  group  whether to group coverage by filename or function
  by  whether to count coverage by line or expression
  ...  additional arguments ignored

Value

  The coverage object (invisibly).

Description

  Display covr results using a standalone report

Usage

  report(
    x = package_coverage(),
    file = file.path(tempdir(), paste0(get_package_name(x), "-report.html")),
    browse = interactive()
  )

Arguments

  x  a coverage dataset, defaults to running package_coverage().
  file  The report filename.
  browse  whether to open a browser to view the report.

Examples

  ## Not run:
  x <- package_coverage()
  report(x)

  ## End(Not run)
**tally_coverage**  
*Tally coverage by line or expression*

**Description**

Tally coverage by line or expression

**Usage**

```r
tally_coverage(x, by = c("line", "expression"))
```

**Arguments**

- `x`: the coverage object returned from `package_coverage()`
- `by`: whether to tally coverage by line or expression

**Value**

a `data.frame` of coverage tallied by line or expression.

---

**to_cobertura**  
*Create a Cobertura XML file*

**Description**

This functionality requires the xml2 package be installed.

**Usage**

```r
to_cobertura(cov, filename = "cobertura.xml")
```

**Arguments**

- `cov`: the coverage object returned from `package_coverage()`
- `filename`: the name of the Cobertura XML file

**Author(s)**

Willem Ligtenberg
to_sonarqube

Description

Create a SonarQube Generic XML file for test coverage according to https://docs.sonarqube.org/latest/analysis/generic-test/ Based on cobertura.R

Usage

to_sonarqube(cov, filename = "sonarqube.xml")

Arguments

cov the coverage object returned from package_coverage()
filename the name of the SonarQube Generic XML file

Author(s)

Talkdesk Inc.

value

Description

Retrieve the value from an object

Usage

value(x, ...)

Arguments

x object from which to retrieve the value
... additional arguments passed to methods
**zero_coverage**

*Provide locations of zero coverage*

---

**Description**

When examining the test coverage of a package, it is useful to know if there are any locations where there is 0 test coverage.

**Usage**

```r
zero_coverage(x, 
```

**Arguments**

- `x`: a coverage object returned `package_coverage()`
- `...`: additional arguments passed to `tally_coverage()`

**Details**

if used within RStudio this function outputs the results using the Marker API.

**Value**

A `data.frame` with coverage data where the coverage is 0.
