Package ‘diyar’

December 5, 2021

**Type** Package

**Title** Record Linkage and Epidemiological Case Definitions in R

**Date** 2021-12-04

**Version** 0.4.1

**URL** https://olisansonwu.github.io/diyar/index.html

**BugReports** https://github.com/OlisaNsonwu/diyar/issues

**Author** Olisaeloka Nsonwu

**Maintainer** Olisaeloka Nsonwu <olisa.nsonwu@gmail.com>

**Description** An R package for record linkage and implementing epidemiological case definitions in R.

- Record linkage is implemented either through a multistage deterministic approach or a probabilistic approach.
- Matching records are assigned to unique groups. There are mechanisms to address missing data and conflicting matches across linkage stages.
- Track and assign events (e.g. sample collection) and periods (e.g. hospital admission) to unique groups based on a case definition.
- The tracking process permits several options such as episode lengths and recurrence.
- Duplicate events or records can then be identified for removal or further analyses.

**License** GPL-3

**Encoding** UTF-8

**LazyData** true

**Imports** methods, utils, Rfast, ggplot2, rlang

**RoxygenNote** 7.1.2

**Suggests** knitr, rmarkdown, testthat, covr

**VignetteBuilder** knitr

**Language** en-GB

**NeedsCompilation** no

**Depends** R (>= 3.5.0)

**Repository** CRAN

**Date/Publication** 2021-12-05 14:10:06 UTC
### Description

Recursive evaluation of a function (func) on each attribute (vector) in a `sub_criteria`.

### Usage

```r
attr_eval(x, func = length, simplify = TRUE)
```
Arguments

- **x** [subCriteria]:
- **func** [function]:
- **simplify** If TRUE (default), coerce to a vector.

Value

vector; list

Examples

```r
x <- subCriteria(rep(1, 5), rep(5 * 10, 5))
attr_eval(x)
attr_eval(x, func = max)
attr_eval(x, func = max, simplify = FALSE)
attr_eval(subCriteria(x, x), func = max, simplify = FALSE)
```

---

**combi**

Vector combinations

Description

Numeric codes for unique combination of vectors.

Usage

```r
combi(...)  
```

Arguments

... [atomic]

Value

numeric

Examples

```r
x <- c("A", "B", "A", "C", "B", "B")
y <- c("X", "X", "Z", "Z", "X", "Z")
combi(x, y)
```

# The code above is equivalent to but quicker than the one below.
```r
z <- paste0(y, ",", x)
z <- match(z, z)
z
```
**custom_sort**  
*Nested sorting*

**Description**
Returns a sort order after sorting by a vector within another vector.

**Usage**
custom_sort(..., decreasing = FALSE, unique = FALSE)

**Arguments**
- ...: Sequence of atomic vectors. Passed to `order`.
- decreasing: Sort order. Passed to `order`.
- unique: If FALSE (default), ties get the same rank. If TRUE, ties are broken.

**Value**
umeric sort order.

**Examples**
```
a <- c(1, 1, 1, 2, 2)
b <- c(2, 3, 2, 1, 1)
custom_sort(a, b)
custom_sort(b, a)
custom_sort(b, a, unique = TRUE)
```

**delink**  
*Unlink group identifiers*

**Description**
Unlink records from an episode (`epid`), record group (`pid`) or pane (`pane`) object.
Usage

delink(x, lgk, ...)

## S3 method for class 'epid'
delink(x, lgk, ...)

## S3 method for class 'pane'
delink(x, lgk, ...)

## S3 method for class 'pid'
delink(x, lgk, ...)

Arguments

x [epid|pid|pane]

lgk [logical]. Subset of records to unlink.

... Other arguments.

Value

epid; pid; pane

Examples

ep <- episodes(1:8)
unlinked_ep <- delink(ep, ep@sn %in% c(3, 8))
ep; unlinked_ep

pn <- partitions(1:8, length.out = 2, separate = TRUE)
unlinked_pn <- delink(pn, pn@.Data == 5)
pn; unlinked_pn

pd <- links(list(c(1, 1, 1, NA, NA),
                 c(NA, NA, 2, 2, 2)))
unlinked_pd <- delink(pd, pd@pid_cri == 1)
pd; unlinked_pd

# A warning is given if an index record is unlinked as this will lead to seemly impossible links.
ep2 <- episodes(1:8, 2, episode_type = "rolling")
unlinked_ep2 <- delink(ep2, ep2@sn %in% c(3, 5))
schema(ep2, custom_label = decode(ep2@case_nm), seed = 2)
schema(unlinked_ep2, custom_label = decode(unlinked_ep2@case_nm), seed = 2)
**Description**

Encode and decode character and numeric values.

**Usage**

```r
encode(x, ...)
```

```r
decode(x, ...)
```

```r
## Default S3 method:
encode(x, ...)
```

```r
## S3 method for class 'd_label'
encode(x, ...)
```

```r
## Default S3 method:
decode(x, ...)
```

**Arguments**

- `x` [d_report].
- `...` Arguments passed to other methods.

**Labelling in diyar**

- **Description**
  - Encode and decode character and numeric values.

- **Usage**
  - `encode(x, ...)`
  - `decode(x, ...)`
  - `## Default S3 method:
    encode(x, ...)`
  - `## S3 method for class 'd_label'
    encode(x, ...)`
  - `## Default S3 method:
decode(x, ...)`
## S3 method for class 'd_label'
decode(x, ...)

## S3 method for class 'd_label'
rep(x, ...)

## S3 method for class 'd_label'
x[i, ..., drop = TRUE]

## S3 method for class 'd_label'
x[[i, ..., drop = TRUE]]

### Arguments

- **x** [d_label|atomic]
- **...** Other arguments.
- **i** i
- **drop** drop

### Details

To minimise memory usage, most components of `pid`, `epid` and `pane` are integer objects with labels. `encode()` and `decode()` translates these codes and labels as required.

### Value

d_label; atomic

### Examples

cds <- encode(rep(LETTERS[1:5], 3))
cds

nms <- decode(cds)
nms

---

### Description

S4 objects storing the result of `episodes`. 
Usage

is.epid(x)

as.epid(x)

## S3 method for class 'epid'
format(x, ...)

## S3 method for class 'epid'
unique(x, ...)

## S3 method for class 'epid'
summary(object, ...)

## S3 method for class 'epid_summary'
print(x, ...)

## S3 method for class 'epid'
as.data.frame(x, ...)

## S3 method for class 'epid'
as.list(x, ...)

## S4 method for signature 'epid'
show(object)

## S4 method for signature 'epid'
rep(x, ...)

## S4 method for signature 'epid'
x[i, j, ..., drop = TRUE]

## S4 method for signature 'epid'
x[[i, j, ..., exact = TRUE]]

## S4 method for signature 'epid'
c(x, ...)

Arguments

x x
...
object object
i i
j j
drop drop
exact exact
episodes

Slots

- sn  Unique record identifier.
- .Data Unique episode identifier.
- wind_id Unique window identifier.
- wind_nm Type of window i.e. "Case" or "Recurrence".
- case_nm Record type in regards to case assignment.
- dist_wind_index Unit difference between each record and its window’s reference record.
- dist_epid_index Unit difference between each record and its episode’s reference record.
- epid_dataset Data sources in each episode.
- epid_interval The start and end dates of each episode. A number_line object.
- epid_length The duration or length of (epid_interval).
- epid_total The number of records in each episode.
- iteration The iteration of the tracking process when a record was linked to its episode.
- options Some options passed to the instance of episodes.

Examples

```r
# A test for 'epid' objects
ep <- episodes(date = 1)
is.epid(ep); is.epid(2)
```

```r
episodes Link events to chronological episodes.
```

Description

Create temporal links between dated events. Each set of linked records are assigned a unique identifier with relevant group-level information.

Usage

episodes(
  date,
  case_length = Inf,
  episode_type = "fixed",
  recurrence_length = case_length,
  episode_unit = "days",
  strata = NULL,
  sn = NULL,
  episodes_max = Inf,
  rolls_max = Inf,
  case_overlap_methods = 8,
)
recurrence_overlap_methods = case_overlap_methods,
skip_if_b4_lengths = FALSE,
data_source = NULL,
data_links = "ANY",
custom_sort = NULL,
skip_order = Inf,
reference_event = "last_record",
case_for_recurrence = FALSE,
from_last = FALSE,
group_stats = FALSE,
display = "none",
case_sub_criteria = NULL,
recurrence_sub_criteria = case_sub_criteria,
case_length_total = 1,
recurrence_length_total = case_length_total,
skip_unique_strata = TRUE
)

Arguments

date [date|datetime|integer|number_line]. Event date or period.
case_length [integer|number_line]. Duration from index event distinguishing one "Case" from another.
episode_type [character]. Options are "fixed" (default), "rolling" or "recursive". See Details.
recurrence_length [integer|number_line]. Duration from an event distinguishing a "Recurrent" event from its index event.
episode_unit [character]. Time units for case_length and recurrence_length. Options are "seconds", "minutes", "hours", "days" (default), "weeks", "months" or "years". See diyar::episode_unit.
strata [atomic]. Subsets of the dataset. Episodes are created separately for each strata.
sn [integer]. Unique record identifier. Useful for creating familiar epid identifiers.
episodes_max [integer]. The maximum number of episodes permitted within each strata.
rolls_max [integer]. Maximum number of times the index event recurs. Only used if episode_type is "rolling" or "recursive".
case_overlap_methods [character|integer]. Accepted overlaps method for "Case" and "Duplicate" events. Relevant when date is a period (number_line). See (overlaps).
recurrence_overlap_methods [character|integer]. Accepted overlaps method for "Recurrent" and "Duplicate" events. Relevant when date is a period (number_line). See (overlaps).
skip_if_b4_lengths [logical]. If TRUE (default), events before a lagged case_length or recurrence_length are skipped.
episodes

- **data_source** [character]. Data source identifier. Adds the list of data sources in each episode to the `epid`. Useful when the data is from multiple sources.

- **data_links** [list|character]. A set of data_sources required in each `epid`. A record-group without records from these data_sources will be unlinked. See Details.

- **custom_sort** [atomic]. Preferential order for selecting index events. See `custom_sort`.

- **skip_order** [integer]. "nth" level of `custom_sort`. Episodes with index events beyond this level of preference are skipped.

- **reference_event** [character]. Specifies which events are used as index events for a subsequent case_length or recurrence_length. Options are "last_record" (default), "last_event", "first_record" or "first_event".

- **case_for_recurrence** [logical]. If TRUE, both "Case" and "Recurrent" events will have a case_length. If FALSE (default), only case events will have a case window. Only used if `episode_type` is "rolling" or "recursive".

- **from_last** [logical]. Chronological order of episode tracking i.e. ascending (TRUE) or descending (FALSE).

- **group_stats** [logical]. If TRUE (default), episode-specific information like episode start and end dates are returned.

- **display** [character]. Display or produce a status update. Options are; "none" (default), "progress", "stats", "none_with_report", "progress_with_report" or "stats_with_report".

- **case_sub_criteria** [sub_criteria]. Additional matching criteria for events in a case_length.

- **recurrence_sub_criteria** [sub_criteria]. Additional matching criteria for events in a recurrence_length.

- **case_length_total** [integer|number_line]. Minimum number of matched case_lengths required for an episode.

- **recurrence_length_total** [integer|number_line]. Minimum number of matched recurrence_lengths required for an episode.

- **skip_unique_strata** [logical]. If TRUE, a strata with a single event are skipped.

**Details**

`episodes()` links dated records (events) that are within specified durations of each other. In each iteration, an index event is selected and compared against every other event.

Every event is linked to a unique group (episode; `epid` object). These episodes represent occurrences of interest as defined by the rules and conditions specified in the function’s arguments.

By default, this process occurs in ascending order; beginning with the earliest event and proceeding to the most recent one. This can be changed to a descending (`from_last`) or custom order (`custom_sort`). Ties are always broken by the chronological order of events.

In general, three type of episodes are possible;
• “fixed” - An episode where all events are within fixed durations of one index event.
• “rolling” - An episode where all events are within recurring durations of one index event.
• “recursive” - An episode where all events are within recurring durations of multiple index events.

Every event in each episode is categorise as:

• “Case” - Index event of the episode (without matching sub_criteria).
• “Case_CR” - Index event of the episode (with matching sub_criteria).
• “Duplicate_C” - Duplicate of the index event.
• “Recurrent” - Recurrence of the index event (without matching sub_criteria).
• “Recurrent_CR” - Recurrence of the index event (with matching sub_criteria).
• “Duplicate_R” - Duplicate of the recurrent event.
• “Skipped” - Records excluded from the episode tracking process.

If data_links is supplied, every element of the list must be named "l" (links) or "g" (groups). Unnamed elements are assumed to be "l".

• If named "l", only groups with records from every listed data_source will be unlinked.
• If named "g", only groups with records from any listed data_source will be unlinked.

*Records with a missing (NA) strata are excluded from the episode tracking process.*
See vignette("episodes") for further details.

**Value**

epid; list

**See Also**

episodes_wf_splits; custom_sort; sub_criteria; epid_length; epid_window; partitions; links; overlaps; number_line; link_records; schema

**Examples**

data(infections); db_1 <- infections
data(hospital_admissions); db_2 <- hospital_admissions

  db_1$patient_id <- c(rep("PID 1",8), rep("PID 2",3))

  # Fixed episodes
  # One 16-day (15-day difference) episode per patient
  db_1$ep1 <- episodes(date = db_1$date,
             strata = db_1$patient_id,
             case_length = 15,
             episodes_max = 1)

  # Rolling episodes
  # 16-day episodes with recurrence periods of 11 days
  db_1$ep2 <- episodes(date = db_1$date,
episodes_wf_splits

```r
  case_length = 15,
  recurrence_length = 10,
  episode_type = "rolling")

# Interval grouping
db_2$admin_period <- number_line(db_2$admin_dt,
                                  db_2$discharge_dt)

# Episodes of hospital stays
db_2$ep3 <- episodes(date = db_2$admin_period,
                    case_length = index_window(db_2$admin_period),
                    case_overlap_methods = "inbetween")
```

---

**Description**

Track episodes in a reduced dataset.

**Usage**

```
episodes_wf_splits(..., duplicates_recovered = "ANY", reframe = FALSE)
```

**Arguments**

- `...` Arguments passed to `episodes`.
- `duplicates_recovered` [character]. Determines which duplicate records are recycled. Options are "ANY" (default), "without_sub_criteria", "with_sub_criteria" or "ALL". See Details.
- `reframe` [logical]. Determines if the duplicate records in a `sub_criteria` are re-framed (TRUE) or excluded (FALSE).

**Details**

`episodes_wf_splits()` is a wrapper function of `episodes()` which reduces or re-frames the dataset to the minimum number of records required to implement a case definition. This leads to the same outcome but with the benefit of a shorter processing time.

Duplicate records from the same point or period in time are excluded from `episodes()`. The resulting `epid` object is then recycled for the duplicates.

The `duplicates_recovered` argument determines which identifiers are recycled. If "without_sub_criteria" is selected, only identifiers created from a matched `sub_criteria` ("Case_CR" and "Recurrent_CR") are recycled. The opposite ("Case" and "Recurrent") is the case if "with_sub_criteria" is selected. Excluded duplicates of "Duplicate_C" and "Duplicate_R" are always recycled.

The `reframe` argument will either reframe or subset a `sub_criteria`. Both will require slightly different functions for `match_funcs` or `equal_funcs`.

Excludes duplicate records from the same day or period prior before passing the analysis to `episodes`. Only duplicate records that will not affect the case definition are excluded. The resulting episode identifiers are recycled for the duplicate records.
Value

epid: list

See Also

episodes; sub_criteria

Examples

```r
# With 10,000 duplicate records of 20 events,
# `episodes_wf_splits()` will take less time than `episodes()

dates <- seq(from = as.Date("2019-04-01"), to = as.Date("2019-04-20"), by = 1)
dates <- rep(dates, 10000)

system.time(
  ep1 <- episodes(dates, 1)
)

system.time(
  ep2 <- episodes_wf_splits(dates, 1)
)

# Both leads to the same outcome.
al(ep1 == ep2)
```

---

**episode_group**  
*Link events to chronological episodes.*

**Description**

Link dated events (records) which have similar attributes and occur within specified durations of each other. Each set of linked records are assigned a unique identifier with relevant group-level information.

**Usage**

```r
episode_group(df, ..., episode_type = "fixed")

fixed_episodes(
  date,
  case_length = Inf,
  episode_unit = "days",
  to_s4 = TRUE,
  case_overlap_methods = 8,
  deduplicate = FALSE,
  display = "none",
  bi_direction = FALSE,
  recurrence_length = case_length,
  recurrence_overlap_methods = case_overlap_methods,
```
episode_group

include_index_period = TRUE,
..., overlap_methods = 8,
overlap_method = 8,
x
}

rolling_episodes(
date,
case_length = Inf,
recurrence_length = case_length,
episode_unit = "days",
to_s4 = TRUE,
case_overlap_methods = 8,
recurrence_overlap_methods = case_overlap_methods,
deduplicate = FALSE,
display = "none",
bi_direction = FALSE,
include_index_period = TRUE,
..., overlap_methods = 8,
overlap_method = 8,
x
)

Arguments

df [data.frame]. Deprecated. One or more datasets appended together. See Details.
...
Arguments passed to episodes.
episode_type [character]. Options are "fixed" (default), "rolling" or "recursive". See Details.
date [date|datetime|integer|number_line]. Event date or period.
case_length [integer|number_line]. Duration from index event distinguishing one "case" from another. This is the case window.
episode_unit [character]. Time units for case_length and recurrence_length. Options are "seconds", "minutes", "hours", "days" (default), "weeks", "months" or "years". See diyar::episode_unit.
to_s4 [logical]. Deprecated. Output type - epid (TRUE) or data.frame (FALSE).
case_overlap_methods [character|integer]. Methods of overlap considered when tracking duplicates of "case" events. See (overlaps)
deduplicate [logical]. Deprecated. If TRUE, "duplicate" events are excluded from the epid.
display [character]. The progress messages printed on screen. Options are; "none" (default), "progress", "stats", "none_with_report", "progress_with_report" or "stats_with_report".
bi_direction  [logical]. Deprecated. If TRUE, "duplicate" events before and after the index event are tracked.

recurrence_length
  [integer|number_line]. Duration from the last "duplicate" event distinguishing a "recurrent" event from its index event. This is the recurrence window.

recurrence_overlap_methods
  [character|integer]. Methods of overlap considered when tracking duplicates of "recurrent" events. See (overlaps)

include_index_period
  [logical]. Deprecated. If TRUE, events overlapping with the index event or period are linked even if they are outside the cut-off period.

overlap_methods
  [character]. Deprecated. Please use case_overlap_methods or recurrence_overlap_methods. Methods of overlap considered when tracking duplicate event. See (overlaps)

overlap_method
  [character]. Deprecated. Please use case_overlap_methods or recurrence_overlap_methods. Methods of overlap considered when tracking event. All event are checked by the same set of overlap_method.

x
  [date|datetime|integer|number_line]. Deprecated. Record date or period. Please use date.

Details

These functions are superseded. Moving forward, please use episodes.

Value

epid; list

episodes

date

Description

Evaluate a sub_criteria.

Evaluate a sub_criteria.
Usage

eval_sub_criteria(x, ...)

## S3 method for class 'sub_criteria'
eval_sub_criteria(
  x,
  x_pos = seq_len(max(attr_eval(x))),
  y_pos = rep(1L, length(x_pos)),
  check_duplicates = TRUE,
  ...
)

Arguments

x [sub_criteria].

... Arguments passed to methods.

x_pos [integer]. Index of one half of a record pair

y_pos [integer]. Index of one half of a record pair

check_duplicates [logical]. If FALSE, does not check duplicate values. The result of the initial check will be recycled.

Value

logical; list

See Also

sub_criteria; reframe

Examples

# Consider two attributes
attr_1 <- c(1, 1, 0)
attr_2 <- c(2, 1, 2)

# Test for a match in either attribute
sub_cri_1 <- sub_criteria(attr_1, attr_2)
eval_sub_criteria(sub_cri_1)

# Test for a match in both attributes
sub_cri_2 <- sub_criteria(attr_1, attr_2, operator = "and")
eval_sub_criteria(sub_cri_2)
Description

Match records in consecutive stages with different matching criteria. Each set of linked records are assigned a unique identifier with relevant group-level information.

Usage

```r
links(
  criteria,
  sub_criteria = NULL,
  sn = NULL,
  strata = NULL,
  data_source = NULL,
  data_links = "ANY",
  display = "none",
  group_stats = FALSE,
  expand = TRUE,
  shrink = FALSE,
  recursive = FALSE,
  check_duplicates = FALSE,
  tie_sort = NULL
)
```

Arguments

- **criteria** [list|atomic]. Attributes to compare. Each element of the list is a stage in the linkage process. See Details.
- **sub_criteria** [list|sub_criteria]. Additional matching criteria for each stage of the linkage process. See `sub_criteria`.
- **sn** [integer]. Unique record identifier. Useful for creating familiar `pid` identifiers.
- **strata** [atomic]. Subsets of the dataset. Record-groups are created separately for each strata. See Details.
- **data_source** [character]. Data source identifier. Adds the list of data sources in each record-group to the `pid`. Useful when the data is from multiple sources.
- **data_links** [list|character]. A set of `data_sources` required in each `pid`. A record-group without records from these `data_sources` will be `unlinked`. See Details.
- **display** [character]. Display or produce a status update. Options are: "none" (default), "progress", "stats", "none_with_report", "progress_with_report" or "stats_with_report".
- **group_stats** [logical]. If TRUE (default), return group specific information like record counts for each `pid`. 
expand [logical]. If TRUE, allows a record-group to expand with each subsequent stage of the linkage process. Not interchangeable with shrink.

shrink [logical]. If TRUE, forces a record-group to shrink with each subsequent stage of the linkage process. Not interchangeable with expand.

recursive [logical]. If TRUE, within each iteration of the process, a match can spawn new matches.

check_duplicates [logical]. If TRUE, within each iteration of the process, duplicates values of an attributes are not checked. The outcome of the logical test on the first instance of the value will be recycled for the duplicate values.

tie_sort [atomic]. Preferential order for breaking tied matches within a stage.

Details

Match priority decreases with each subsequent stage of the linkage process i.e. earlier stages (criteria) are considered superior. Therefore, it's important for each criteria to be listed in an order of decreasing relevance.

Records with missing criteria (NA) are skipped at each stage, while records with missing strata (NA) are skipped from the entire linkage process.

If a record is skipped, another attempt will be made to match the record at the next stage. If a record does not match any other record by the end of the linkage process (or it has a missing strata), it is assigned to a unique record-group.

A sub_criteria can be used to request additional matching conditions for each stage of the linkage process. When used, only records with a matching criteria and sub_criteria are linked.

In links, each sub_criteria must be linked to a criteria. This is done by adding a sub_criteria to a named element of a list. Each element's name must correspond to a stage. See below for an example of 3 sub_criteria linked to criteria 1, 5 and 13.

For example:

```r
list("cr1" = sub_criteria(...),"cr5" = sub_criteria(...),"cr13" = sub_criteria(...)).
```

sub_criteria can be nested to achieve nested conditions.

A sub_criteria can be linked to different criteria but any unlinked sub_criteria will be ignored.

By default, attributes in a sub_criteria are compared for an exact_match. However, user-defined functions are also permitted. Such functions must meet three requirements:

1. It must be able to compare the attributes.
2. It must have two arguments named `x` and `y`, where `y` is the value for one observation being compared against all other observations (`x`).
3. It must return a logical object i.e. TRUE or FALSE.

Every element in data_links must be named "l" (links) or "g" (groups). Unnamed elements of data_links will be assumed to be "l".

- If named "l", only groups with records from every listed data_source will remain linked.
• If named "g", only groups with records from any listed data_source will remain linked.

See vignette("links") for more information.

Value

pid: list

See Also

link_records; episodes; partitions; predefined_tests; sub_criteria; schema

Examples

# Exact match
attr_1 <- c(1, 1, 1, NA, NA, NA, NA, NA)
attr_2 <- c(NA, NA, 2, 2, 2, NA, NA, NA)
links(criteria = list(attr_1, attr_2))

# User-defined tests using 'sub_criteria()'
# Matching `sex` and a 20-year age range
age <- c(30, 28, 40, 25, 25, 29, 27)
f1 <- function(x, y) abs(y - x) \%in\% 0:20
links(criteria = sex,
       sub_criteria = list(cr1 = sub_criteria(age, match_funcs = f1)))

# Multistage matches
# Relevance of matches: `forename` > `surname`
data(staff_records); staff_records
links(criteria = list(staff_records$forename, staff_records$surname),
       data_source = staff_records$sex)

# Relevance of matches:
# `staff_id` > `age` (AND (`initials`, `hair_colour` OR `branch_office`))
data(missing_staff_id); missing_staff_id
links(criteria = list(missing_staff_id$staff_id, missing_staff_id$age),
       sub_criteria = list(cr2 = sub_criteria(missing_staff_id$initials,
                                               missing_staff_id$hair_colour,
                                               missing_staff_id$branch_office)),
       data_source = missing_staff_id$source_1)

# Group expansion
match_cri <- list(c(1,NA,NA,1,1,NA,NA,NA),
                  c(1,1,1,2,2,2),
                  c(3,3,3,2,2,2))
links(criteria = match_cri, expand = TRUE)
links(criteria = match_cri, expand = FALSE)
links(criteria = match_cri, shrink = TRUE)
Description

Deterministic and probabilistic record linkage with partial or evaluated matches.

Usage

```r
link_records(
  attribute,
  blocking_attribute = NULL,
  cmp_func = diyar::exact_match,
  attr_threshold = 1,
  probabilistic = TRUE,
  m_probability = 0.95,
  u_probability = NULL,
  score_threshold = 1,
  repeats_allowed = FALSE,
  permutations_allowed = FALSE,
  data_source = NULL,
  ignore_same_source = TRUE,
  display = "none"
)
```

```r
links_wf_probabilistic(
  attribute,
  blocking_attribute = NULL,
  cmp_func = diyar::exact_match,
  attr_threshold = 1,
  probabilistic = TRUE,
  m_probability = 0.95,
  u_probability = NULL,
  score_threshold = 1,
  id_1 = NULL,
  id_2 = NULL,
  ...
)
```

```r
prob_score_range(attribute, m_probability = 0.95, u_probability = NULL)
```

Arguments

- `attribute` [atomic|list|data.frame|matrix|d_attribute]. Attributes to compare.
- `blocking_attribute` [atomic]. Subsets of the dataset.
- `cmp_func` [list|function]. String comparators for each attribute. See Details.
attrs_threshold [list|numeric|number_line]. Weight-thresholds for each cmp_func. See Details.

probabilistic [logical]. If TRUE, scores are assigned based on Fellegi-Sunter model for probabilistic record linkage. See Details.

m_probability [list|numeric]. The probability that a matching record is the same entity.

u_probability [list|numeric]. The probability that a matching record is not the same entity.

score_threshold [numeric|number_line]. Score-threshold for linked records. See Details.

repeats_allowed [numeric|number_line]. If TRUE, repetition is included.

permutations_allowed [logical]. If TRUE, permutations are included.

data_source [character]. Data source identifier. Adds the list of data sources in each record-group to the pid. Useful when the data is from multiple sources.

ignore_same_source [logical]. If TRUE, only records from different data_source are compared.

display [character]. Display or produce a status update. Options are: "none" (default), "progress", "stats", "none_with_report", "progress_with_report" or "stats_with_report".

id_1 [list|numeric]. Record id or index of one half of a record pair.

id_2 [list|numeric]. Record id or index of one half of a record pair.

... Arguments passed to links

Details

link_records() and links_wf_probabilistic() are functions to implement deterministic, fuzzy or probabilistic record linkage. link_records() compares every record-pair in one instance, while links_wf_probabilistic() is a wrapper function of links and so compares batches of record-pairs in iterations.

link_records() is more thorough in the sense that it compares every combination of record-pairs. This makes it faster but is memory intensive, particularly if there's no blocking_attribute. In contrast, links_wf_probabilistic() is less memory intensive but takes longer since it does its checks in batches.

The implementation of probabilistic record linkage is based on Fellegi and Sunter (1969) model for deciding if two records belong to the same entity.

In summary, record-pairs are created and categorised as matches and non-matches (attr_threshold) with user-defined functions (cmp_func). Two probabilities (m and u) are then estimated for each record-pair to score the matches and non-matches. The m-probability is the probability that matched records are actually from the same entity i.e. a true match, while u-probability is the probability that matched records are not from the same entity i.e. a false match. By default, u-probabilities are calculated as the frequency of each value of an attribute however, they can also be supplied along with m-probabilities. Record-pairs whose total score are above a certain threshold (score_threshold) are assumed to belong to the same entity.
Agreement (match) and disagreement (non-match) scores are calculated as described by Asher et al. (2020).

For each record pair, an agreement for attribute \(i\) is calculated as:

\[
\log_2(m_i / u_i)
\]

For each record pair, a disagreement score for attribute \(i\) is calculated as:

\[
\log_2((1 - m_i) / (1 - u_i))
\]

where \(m_i\) and \(u_i\) are the \(m\) and \(u\)-probabilities for each value of attribute \(i\).

Note that each probability is calculated as a combined probability for the record pair. For example, if the values of the record-pair have \(u\)-probabilities of \(.1\) and \(.2\) respectively, then the \(u\)-probability for the pair will be \(.02\).

Missing data (NA) are considered non-matches and assigned a \(u\)-probability of \(0\).

By default, matches and non-matches for each attribute are determined as an \texttt{exact_match} with a binary outcome. Alternatively, user-defined functions (\texttt{cmp_func}) are used to create similarity scores. Pairs with similarity scores within (\texttt{attr_threshold}) are then considered matches for the corresponding attribute.

If \texttt{probabilistic} is \texttt{FALSE}, the sum of all similarity scores is used as the \texttt{score_threshold} instead of deriving one from the \(m\) and \(u\)-probabilities.

A \texttt{blocking_attribute} can be used to reduce the processing time by restricting comparisons to subsets of the dataset.

In \texttt{link_records()}, \texttt{score_threshold} is a convenience argument because every combination of record-pairs are returned therefore, a new \texttt{score_threshold} can be selected after reviewing the final scores. However, in \texttt{links_wf_probabilistic()}, the \texttt{score_threshold} is more important because a final selection is made at each iteration.

As a result, \texttt{links_wf_probabilistic()} requires an acceptable \texttt{score_threshold} in advance. To help with this, \texttt{prob_score_range()} can be used to return the range of scores attainable for a given set of attribute, \(m\) and \(u\)-probabilities. Additionally, \texttt{id_1} and \texttt{id_2} can be used to link specific records pairs, aiding the review of potential scores.

**Value**

\texttt{pid: list}

                       score_threshold = -16, recursive = TRUE)

# Using string comparators
# For example, matching last word in 'hair_colour' and 'branch_office'
lst_word_wf <- function(x) tolower(gsub("^.* ", "", x))
lst_word_cmp <- function(x, y) lst_word_wf(x) == lst_word_wf(y)

link_records(dfr, attr_threshold = 1,
             cmp_func = c(diyar::exact_match,
                          diyar::exact_match,
                          lst_word_cmp,
                          lst_word_cmp),
             score_threshold = -4)
links_wf_probabilistic(dfr, attr_threshold = 1,
                       cmp_func = c(diyar::exact_match,
                                     diyar::exact_match,
                                     lst_word_cmp,
                                     lst_word_cmp),
                       score_threshold = -4,
                       recursive = TRUE)

listr

Grammatical lists.

Description

A convenience function to format atomic vectors as a written list.

Usage

listr(x, sep = "", conj = " and ", lim = Inf)

Arguments

x atomic vector.
sep Separator.
**make_ids**

Final separator.

Elements to include in the list. Other elements are abbreviated to "...".

**Value**

character.

**Examples**

```r
listr(1:5)
listr(1:5, sep = ";")
listr(1:5, sep = ";", conj = " and")
listr(1:5, sep = ";", conj = " and", lim = 2)
```

---

**Description**

Create record-pair combination of a vector’s elements.

**Usage**

```r
make_ids(x_pos, y_pos, id_length = max(x_pos, y_pos))
```

**Arguments**

- `x_pos` [integer]. Index of one half of a record-pair
- `y_pos` [integer]. Index of one half of a record-pair
- `id_length` Length of the record identifier.

**Details**

Record groups from non-recursive links have the lowest record ID (sn) in the set as their group ID.

**Value**

list

**Examples**

```r
make_ids(x_pos = rep(7, 7), y_pos = 1:7)
make_ids(x_pos = c(1, 6), y_pos = 6:7)
make_ids(x_pos = 1:5, y_pos = c(1, 1, 2, 3, 4))
```
make_pairs

Record-pair combination.

Description
Create record-pair combination of a vector’s elements.

Usage
make_pairs(
  x,
  strata = NULL,
  repeats_allowed = TRUE,
  permutations_allowed = FALSE
)
make_pairs_wf_source(..., data_source = NULL)

Arguments
x [atomic].
strata Subsets of x. A blocking attribute limiting the combinations created.
repeats_allowed [logical] If TRUE, repetitions are included.
permutations_allowed [logical] If TRUE, permutations are included.
... Arguments passed to make_pairs.
data_source [character]. Data source identifier. Limits to record-pairs to those from different sources.

Value
A list of indexes and values of record-pair combinations

See Also
eval_sub_criteria

Examples
make_pairs(month.abb[1:4])
make_pairs(month.abb[1:4], strata = c(1, 1, 2, 2))
**merge_identifiers**

**Merge group identifiers**

**Description**

Consolidate two group identifiers.

**Usage**

```r
merge_ids(...)  
```

## Default S3 method:
```r
merge_ids(id1, id2, tie_sort = NULL, ...)
```

## S3 method for class 'pid'
```r
merge_ids(id1, id2, tie_sort = NULL, ...)
```

## S3 method for class 'epid'
```r
merge_ids(id1, id2, tie_sort = NULL, ...)
```

## S3 method for class 'pane'
```r
merge_ids(id1, id2, tie_sort = NULL, ...)
```

**Arguments**

- `...` Other arguments
- `id1` [epid|pid|pane].
- `id2` [epid|pid|pane].
- `tie_sort` [atomic]. Preferential order for breaking tied matches.

**Details**

Groups in `id1` are expanded by groups `id2`.

**See Also**

- links; link_records; episodes; partitions

**Examples**

```r
data(missing_staff_id)
dfr <- missing_staff_id
id1 <- links(dfr[[5]])
id2 <- links(dfr[[6]])
id1; id2; merge_ids(id1, id2)
```
Description

A range of numeric values.

Usage

number_line(l, r, id = NULL, gid = NULL)

as.number_line(x)

is.number_line(x)

left_point(x)

left_point(x) <- value

right_point(x)

right_point(x) <- value

start_point(x)

start_point(x) <- value

end_point(x)

end_point(x) <- value

number_line_width(x)

reverse_number_line(x, direction = "both")

shift_number_line(x, by = 1)

expand_number_line(x, by = 1, point = "both")

invert_number_line(x, point = "both")

number_line_sequence(
  x,
  by = NULL,
  length.out = 1,
  fill = TRUE,
  simplify = FALSE
Arguments

l  [numeric based]. Left point of the number_line. Must be able to be coerced to a numeric object.

r  [numeric based]. Right point of the number_line. Must be able to be coerced to a numeric object.

id  [integer]. Unique element identifier. Optional.

x  [number_line]

value  [numeric based]

direction  [character]. Type of "number_line" objects to be reversed. Options are: "increasing", "decreasing" or "both" (default).

by  [integer]. Increment or decrement. Passed to seq() in number_line_sequence()

point  [character]. "start", "end", "left" or "right" point.

length.out  [integer]. Number of splits. For example, 1 for two parts or 2 for three parts. Passed to seq()

fill  [logical]. Retain (TRUE) or drop (FALSE) the remainder of an uneven split

simplify  [logical]. Split into number_line or sequence of finite numbers

Details

A number_line represents a range of numbers on a number line. It is made up of a start and end point which are the lower and upper ends of the range respectively. The location of the start point - left or right, determines whether it is an "increasing" or "decreasing" range. This is the direction of the number_line.

reverse_number_line() - reverses the direction of a number_line. A reversed number_line has its left and right points swapped. The direction argument specifies which type of number_line will be reversed. number_line with non-finite start or end points (i.e. NA, NaN and Inf) can't be reversed.

shift_number_line() - Shift a number_line towards the positive or negative end of the number line.

expand_number_line() - Increase or decrease the width of a number_line.

invert_number_line() - Change the left or right points from a negative to positive value or vice versa.

number_line_sequence() - Split a number_line into equal parts (length.out) or by a fixed recurring width (by).

Value

number_line

```

---

**number_line-class**  **number_line object**

**Description**

S4 objects representing a range of numeric values

**Usage**

```r
## S4 method for signature 'number_line'
show(object)

## S4 method for signature 'number_line'
rep(x, ...)

## S4 method for signature 'number_line'
x[i, j, ..., drop = TRUE]

## S4 method for signature 'number_line'
x[[i, j, ..., exact = TRUE]]

## S4 replacement method for signature 'number_line,ANY,ANY,ANY'
x[i, j, ...] <- value

## S4 replacement method for signature 'number_line,ANY,ANY,ANY'
x[[i, j, ...]] <- value

## S4 method for signature 'number_line'
x$name

## S4 replacement method for signature 'number_line'
x$name <- value

## S4 method for signature 'number_line'
c(x, ...)

## S3 method for class 'number_line'
unique(x, ...)

## S3 method for class 'number_line'
seq(x, fill = TRUE, simplify = FALSE, ...)
```
## S3 method for class 'number_line'
sort(x, decreasing = FALSE, ...)

## S3 method for class 'number_line'
format(x, ...)

## S3 method for class 'number_line'
as.list(x, ...)

## S3 method for class 'number_line'
as.data.frame(x, ...)

Arguments

object object
x x
... ... 
i i
j j
drop drop
exact exact
value value
name slot name
fill [logical]. Retain (TRUE) or drop (FALSE) the remainder of an uneven split
simplify [logical]. Split into number_line or sequence of finite numbers
decreasing If TRUE, sort in descending order.

Slots

start First value in the range.
id Unique element id. Optional.
gid Unique group id. Optional.
.Data Length, duration or width of the range.

overlaps Overlapping number line objects

Description

Identify overlapping number_line objects
Usage

overlaps(x, y, methods = 8)

overlap(x, y)

exact(x, y)

reverse(x, y)

across(x, y)

x_across_y(x, y)

y_across_x(x, y)

chain(x, y)

x_chain_y(x, y)

y_chain_x(x, y)

aligns_start(x, y)

aligns_end(x, y)

inbetween(x, y)

x_inbetween_y(x, y)

y_inbetween_x(x, y)

overlap_method(x, y)

include_overlap_method(methods)

exclude_overlap_method(methods)

overlap_method_codes(methods)

overlap_method_names(methods)

Arguments

x [number_line]

y [number_line]

methods [charater|integer]. Methods of overlap. Check different pairs of number_line objects by different methods. Options are "exact", "reverse", "inbetween", 
Details

9 logical test:

- **exact()** - Identical left and right points.
- **reverse()** - Swapped left and right points.
- **inbetween()** - Start and end point of one number_line object is within the start and end point of another. Split into x_inbetween_y() and y_inbetween_x().
- **across()** - Start or end point of one number_line object is in between the start and end point of another. Split into x_across_y() and y_across_x().
- **chain()** - Endpoint of one number_line object is the same as the start point of another. Split into x_chain_y() and y_chain_x().
- **aligns_start()** - Identical start points only.
- **aligns_end()** - Identical end point only.
- **overlap()** - Any kind of overlap. A convenient method for "ANY" and "ALL" overlap methods.
- **overlaps()** - Overlap by a specified combination of the methods.

**Describe methods of overlap:**

- **overlap_method()** - Shows how a pair of number_line object has overlapped. Does not show "overlap" since overlap() is always TRUE when any other method is TRUE.
- **include_overlap_method()** and **exclude_overlap_method()** - Conveniently create the required values for methods, and case_overlap_methods and recurrence_overlap_methods in episodes.
- **overlap_method_codes()** - Numeric codes for the supported combination of overlap methods.

partitions

Arguments

\[
\begin{array}{ll}
\text{x} & \text{x} \\
\text{...} & \text{...} \\
\text{object} & \text{object} \\
\text{i} & \text{i} \\
\text{j} & \text{j} \\
\text{drop} & \text{drop} \\
\text{exact} & \text{exact}
\end{array}
\]

Slots

- `sn` Unique record identifier.
- `.Data` Unique pane identifier.
- `case_nm` Record type in regards to index assignment.
- `window_list` A list of considered windows for each pane.
- `dist-pane-index` The difference between each event and it's index event.
- `pane_dataset` Data sources in each pane.
- `pane-interval` The start and end dates of each pane. A `number-line` object.
- `pane-length` The duration or length of (`pane-interval`).
- `pane-total` The number of records in each pane.
- `options` Some options passed to the instance of `partitions`.
- `window-matched` A list of matched windows for each pane.

Examples

```
# A test for pane objects
pn <- partitions(date = 1, by = 1)
is.pane(pn); is.pane(2)
```

partitions

Distribute events into specified intervals.

Description

Distribute events into groups defined by time or numerical intervals. Each set of linked records are assigned a unique identifier with relevant group-level data.
partitions

Usage

partitions(
  date,
  window = number_line(0, Inf),
  windows_total = 1,
  separate = FALSE,
  sn = NULL,
  strata = NULL,
  data_links = "ANY",
  custom_sort = NULL,
  group_stats = FALSE,
  data_source = NULL,
  by = NULL,
  length.out = NULL,
  fill = TRUE,
  display = "none"
)

Arguments

date [date|datetime|integer|number_line]. Event date or period.
window [integer|number_line]. Numeric or time intervals.
windows_total [integer|number_line]. Minimum number of matched windows required for a pane. See details
separate [logical]. If TRUE, events matched to different windows are not linked.
sn [integer]. Unique record identifier. Useful for creating familiar pane identifiers.
strata [atomic]. Subsets of the dataset. Panes are created separately for each strata.
data_links [list|character]. A set of data_sources required in each pane. A pane without records from these data_sources will be unlinked. See Details.
custom_sort [atomic]. Preferred order for selecting "index" events.
group_stats [logical]. If TRUE (default), the returned pane object will include group specific information like panes start and end dates.
data_source [character]. Unique data source identifier. Adds the list of datasets in each pane to the pane. Useful when the data is from multiple sources.
by [integer]. Width of splits.
length.out [integer]. Number of splits.
fill [logical]. Retain (TRUE) or drop (FALSE) the remainder of an uneven split.
display [character]. Display a status update. Options are; "none" (default), "progress" or "stats".
Details

Each assigned group is referred to as a pane. A pane consists of events within a specific time or numerical intervals (window).

Each window must cover a separate interval. Overlapping windows are merged before events are distributed into panes. Events that occur over two windows are assigned to the last one listed.

Alternatively, you can create windows by splitting a period into equal parts (length.out), or into a sequence of intervals with fixed widths (by).

By default, the earliest event is taken as the "Index" event of the pane. An alternative can be chosen with custom_sort. Note that this is simply a convenience option because it has no bearing on how groups are assigned.

partitions() will categorise records into 3 types;

- "Index" - Index event/record of the pane.
- "Duplicate_I" - Duplicate of the "Index" record.
- "Skipped" - Records that are not assigned to a pane.

Every element in data_links must be named "l" (links) or "g" (groups). Unnamed elements of data_links will be assumed to be "l".

- If named "l", only groups with records from every listed data_source will be retained.
- If named "g", only groups with records from any listed data_source will be retained.

NA values in strata excludes records from the partitioning process.

See vignette("episodes") for more information.

Value

pane

See Also

pane; number_line_sequence; episodes; links; overlaps; number_line; schema

Examples

events <- c(30, 2, 11, 10, 100)
windows <- number_line(c(1, 9, 25), c(3, 12, 35))

partitions(date = events, length.out = 3, separate = TRUE)
partitions(date = events, by = 10, separate = TRUE)
partitions(date = events, window = windows, separate = TRUE)
partitions(date = events, window = windows, separate = FALSE)
partitions(date = events, window = windows, separate = FALSE, windows_total = 4)
Description

S4 objects storing the result of links.

Usage

is.pid(x)

as.pid(x, ...)

## S3 method for class 'pid'
format(x, ...)

## S3 method for class 'pid'
unique(x, ...)

## S3 method for class 'pid'
summary(object, ...)

## S3 method for class 'pid_summary'
print(x, ...)

## S3 method for class 'pid'
as.data.frame(x, ...)

## S3 method for class 'pid'
as.list(x, ...)

## S4 method for signature 'pid'
show(object)

## S4 method for signature 'pid'
rep(x, ...)

## S4 method for signature 'pid'
x[i, j, ..., drop = TRUE]

## S4 method for signature 'pid'
x[[i, j, ..., exact = TRUE]]

## S4 method for signature 'pid'
c(x, ...)

pid-class  pid objects
Arguments

x x
... ...
object object
i i
j j
drop drop
extact exact

Slots

sn Unique record identifier.
.Data Unique group identifier.
link_id Unique record identifier for matching records.
pid_cri Matching criteria.
pid_dataset Data sources in each group.
pid_total The number of records in each group.
iteration The iteration of the linkage process when a record was linked to its group.

Examples

# A test for pid objects
pd <- links(criteria = 1)
is.pid(pd); is.pid(2)

---

**predefined_tests**

**Predefined logical tests in diyar**

**Description**

A collection of predefined logical tests used with `sub_criteria` objects.

**Usage**

```
exact_match(x, y)
range_match(x, y, range = 10)
range_match_legacy(x, y)
prob_link(
  x,
```
y, 
cmp_func, 
attr_threshold, 
score_threshold, 
probabilistic, 
return_weights 
)

Arguments

x Value of an attribute(s) to be compare against.
y Value of an attribute(s) to be compare by.
range Difference between y and x.
cmp_func Logical tests such as string comparators. See links_wf_probabilistic.
attr_threshold Matching set of weight thresholds for each result of cmp_func. See links_wf_probabilistic.
score_threshold Score threshold determining matched or linked records. See links_wf_probabilistic.
probabilistic If TRUE, matches determined through a score derived base on Fellegi-Sunter model for probabilistic linkage. See links_wf_probabilistic.
return_weights If TRUE, returns the match-weights and score-thresholds for record pairs. See links_wf_probabilistic.

Details

exact_match() - test that x == y
range_match() - test that x ≤ y ≤ (x + range)
range_match_legacy() - test that overlap(as.number_line(x@gid),y) is TRUE.
prob_link() - Test that a record-sets x and y are from the same entity based on calculated weights and probability scores.

Examples

'exact_match'
exact_match(x = 1, y = 1)
exact_match(x = 1, y = 2)

'range_match'
range_match(x = 10, y = 16, range = 6)
range_match(x = 16, y = 10, range = 6)

'range_match_legacy'
x_nl <- number_line(10, 16, gid = 10)
y_nl1 <- number_line(16, 10)
y_nl2 <- number_line(16, 10)

range_match_legacy(x = x_nl, y = y_nl1)
range_match_legacy(x = x_nl, y = y_nl2)
record_group

Multistage deterministic record linkage

Description

Match records in consecutive stages with different matching conditions. Each set of linked records are assigned a unique identifier with relevant group-level information.

Usage

record_group(df, ..., to_s4 = TRUE)

Arguments

df [data.frame]. Deprecated. One or more datasets appended together. See Details.
...
Arguments passed to links.
to_s4 [logical]. Deprecated. Output type - pid (TRUE) or data.frame (FALSE).

Details

record_group() is superseded. Moving forward, please use links.

Value

pid

See Also

links

reframe

Modify sub_criteria objects

Description

Modify the attributes of a sub_criteria object.

Usage

reframe(x, ...)

## S3 method for class 'sub_criteria'
reframe(x, func = identity, ...)
Arguments

x  [sub_criteria].
... Arguments passed to methods.
func  [function]. Transformation function.

See Also

sub_criteria; eval_sub_criteria; attr_eval

Examples

s_cri <- sub_criteria(month.abb, month.name)
reframe(s_cri, func = function(x) x[12])
reframe(s_cri, func = function(x) x[12:1])
reframe(s_cri, func = function(x) attrs(x[1:6], x[7:12]))

Description

Create schema diagrams for number_line, epid, pid and pane objects.

Usage

schema(x, ...)

## S3 method for class 'number_line'
schema(x, show_labels = c("date", "case_overlap_methods"), ...)

## S3 method for class 'epid'
schema(
  x,
  title = NULL,
  show_labels = c("length_arrow"),
  show_skipped = TRUE,
  show_non_finite = FALSE,
  theme = "dark",
  seed = NULL,
  custom_label = NULL,
  ...
)

## S3 method for class 'pane'
schema(
  x,
schema

title = NULL,
show_labels = c("window_label"),
theme = "dark",
seed = NULL,
custom_label = NULL,
...
)

## S3 method for class 'pid'
schema(
  x,
  title = NULL,
  show_labels = TRUE,
  theme = "dark",
  orientation = "by_pid",
  seed = NULL,
  custom_label = NULL,
  ...
)

Arguments

x [number|line|pid|pane]
... Other arguments.
show_labels [logical|character]. Show/hide certain parts of the schema. See Details.
title [character]. Plot title.
show_skipped [logical]. Show/hide "Skipped" records.
show_non_finite [logical]. Show/hide records with non-finite date values.
theme [character]. Options are "dark" or "light".
seed [integer]. See set.seed. Used to get a consistent arrangement of items in the plot.
custom_label [character]. Custom label for each record of the identifier.
orientation [character]. Show each record of a pid object within its group id ("by_pid") or its pid_cri ("by_pid_cri")

Details

A visual aid to describe the data linkage (links), episode tracking (episodes) or partitioning process (partitions).

show_labels options (multi-select)

- schema.epid - TRUE, FALSE, "sn", "epid", "date", "case_nm", "wind_nm", "length", "length_arrow", "case_overlap_methods" or "recurrence_overlap_methods"
- schema.pane - TRUE, FALSE, "sn", "pane", "date", "case_nm" or "window_label"
- schema.pid - TRUE, FALSE, "sn" or "pid"
Value

ggplot objects

Examples

```
schema(number_line(c(1, 2), c(2, 1)))
schema(episodes(1:10, 2))
schema(partitions(1:10, by = 2, separate = TRUE))
schema(links(list(c(1, 1, NA, NA), c(NA, 1, 1, NA))))
```

**set_operations**

*Set operations on number line objects*

Description

Perform set operations on a pair of `[number_line]`s.

Usage

```
union_number_lines(x, y)
intersect_number_lines(x, y)
subtract_number_lines(x, y)
```

Arguments

- `x` `[number_line]`
- `y` `[number_line]`

Details

- `union_number_lines()` - Combined the range of `x` and that of `y`
- `intersect_number_lines()` - Subset of `x` that overlaps with `y` and vice versa
- `subtract_number_lines()` - Subset of `x` that does not overlap with `y` and vice versa.

The direction of the returned `[number_line]` will be that of the widest one (`x` or `y`). If `x` and `y` have the same length, it’ll be an “increasing” direction.

If `x` and `y` do not overlap, `NA` (“NA ?? NA”) is returned.

Value

```
[number_line]; list
```
See Also

number_line: overlaps

Examples

```
nl_1 <- c(number_line(1, 5), number_line(1, 5), number_line(5, 9))
nl_2 <- c(number_line(1, 2), number_line(2, 3), number_line(0, 6))

  # Union
  nl_1; nl_2; union_number_lines(nl_1, nl_2)

nl_3 <- number_line(as.Date(c("01/01/2020", "03/01/2020", "09/01/2020"), "%d/%m/%Y"),
                    as.Date(c("09/01/2020", "05/01/2020", "25/12/2020"), "%d/%m/%Y"))

nl_4 <- number_line(as.Date(c("04/01/2020", "01/01/2020", "01/01/2020"), "%d/%m/%Y"),
                    as.Date(c("05/01/2020", "05/01/2020", "03/01/2020"), "%d/%m/%Y"))

  # Intersect
  nl_3; nl_4; intersect_number_lines(nl_3, nl_4)

  # Subtract
  nl_3; nl_4; subtract_number_lines(nl_3, nl_4)
```

---

**staff_records**

*Datasets in diyar package*

**Description**

Datasets in diyar package

**Usage**

data(staff_records)

data(missing_staff_id)

data(infections)

data(infections_2)

data(infections_3)

data(infections_4)

data(hospital_admissions)
data(patient_list)
data(patient_list_2)
data(hourly_data)
data(Opes)
data(episode_unit)
data(overlap_methods)

**Format**

data.frame
data.frame
data.frame
data.frame
data.frame
data.frame
data.frame
An object of class data.frame with 5 rows and 4 columns.
data.frame
data.frame
list
list

**Details**

staff_records - Staff record with some missing data
missing_staff_id - Staff records with missing staff identifiers
infections, infections_2, infections_3 and infections_4 - Reports of bacterial infections
hospital_admissions - Hospital admissions and discharges
patient_list & patient_list_2 - Patient list with some missing data

Hourly data

Opes - List of individuals with the same name
Duration in seconds for each 'episode_unit'

Permutations of number_line overlap methods
Examples

data(staff_records)
data(missing_staff_id)
data(infections)
data(infections_2)
data(infections_3)
data(infections_4)
data(hospital_admissions)
data(patient_list)
data(patient_list_2)
data(hourly_data)
data(0pes)
data(episode_unit)
data(overlap_methods)

---

<table>
<thead>
<tr>
<th>sub_criteria</th>
<th>Sub-criteria</th>
</tr>
</thead>
</table>

Description

Additional matching criteria for each iteration of links and episodes.

Usage

sub_criteria(
  ...,  
  match_funcs = diyar::exact_match,  
  equal_funcs = diyar::exact_match,  
  operator = "or"
)

attrs(..., .obj = NULL)

Arguments

...  [atomic]. Attributes.
match_funcs  [function]. User defined logical test for matches.
equal_funcs  [function]. User defined logical test for identical record sets (all attributes of the same record).
operator  [character]. Options are "and" or "or".
.obj  [data.frame|list]. Attributes
Details

sub_criteria() - The mechanism for providing matching criteria to an iteration of links or episodes. It creates a sub_criteria class object which contains the attributes to be compared, logical tests for the comparisons (see predefined_tests for examples) and another set of logical tests to determine identical records.

attrs() - Pass a collection of attributes to each ... in sub_criteria().

Every attribute, including those in a collection, must have the same length or a length of 1.

Value

sub_criteria

See Also

predefined_tests; links; episodes; eval_sub_criteria

Examples

# Sub-criteria
s_cri1 <- sub_criteria(c(30, 28, 40, 25, 25, 29, 27),
                       match_funcs = range_match)
s_cri2 <- sub_criteria(c(30, 28, 40, 25, 25, 29, 27),
                       match_funcs = exact_match)

# Nested sub-criteria
s_cri3 <- sub_criteria(s_cri1, s_cri2, operator = "or")
s_cri4 <- sub_criteria(s_cri1, s_cri3, operator = "and")

# Objects of the same length
attrs(month.abb, month.name)

# Or a data.frame or list with elements of the same length
attrs(.obj = mtcars)

# Or a combination of the both
attrs(mtcars$mpg, mtcars$cyl, .obj = mtcars)

# Each can then be passed to a `sub-criteria`
sub_criteria(
    month.abb,
    month.name,
    attrs(month.abb, month.name)
    )
Description

Convert windows to and from case_lengths and recurrence_lengths.

Usage

epid_windows(date, lengths, episode_unit = "days")
epid_lengths(date, windows, episode_unit = "days")
index_window(date, from_last = FALSE)

Arguments

date As used in episodes.
lengths The duration (lengths) between a date and window.
episode_unit Time unit of lengths. Options are "seconds", "minutes", "hours", "days", "weeks", "months" or "years". See diyar::episode_unit
windows The range (windows) relative to a date for a given duration (length).
from_last As used in episodes.

Details

epid_windows - returns the corresponding window for a given a date, and case_length or recurrence_length.
epid_lengths - returns the corresponding case_length or recurrence_length for a given date and window.
index_window - returns the corresponding case_length or recurrence_length for the date only.
index_window(date = x) is a convenience function for epid_lengths(date = x, window = x).

Value

number_line.

Examples

# Which `window` will a given `length` cover?
date <- Sys.Date()
epid_windows(date, 10)
epid_windows(date, number_line(5, 10))
epid_windows(date, number_line(-5, 10))
epid_windows(date, -5)
# Which `length` is required to cover a given `window`?
date <- number_line(Sys.Date(), Sys.Date() + 20)
epid_lengths(date, Sys.Date() + 30)
epid_lengths(date, number_line(Sys.Date() + 25, Sys.Date() + 30))
epid_lengths(date, number_line(Sys.Date() - 10, Sys.Date() + 30))
epid_lengths(date, Sys.Date() - 10)

# Which `length` is required to cover the `date`?
index_window(20)
index_window(number_line(15, 20))
