

Package ‘epiworldR’

September 8, 2023

Type Package

Title Fast Agent-Based Epi Models

Version 0.0-3

Date 2023-08-29

Description A flexible framework for Agent-Based Models (ABM), the 'epiworldR' package provides methods for prototyping disease outbreaks and transmission models using a 'C++' back-end, making it very fast. It supports multiple epidemiological models, including the Susceptible-Infected-Susceptible (SIS), Susceptible-Infected-Removed (SIR), Susceptible-Exposed-Infected-Removed (SEIR), and others, involving arbitrary mitigation policies and multiple-disease models. Users can specify infectiousness/susceptibility rates as a function of agents' features, providing great complexity for the model dynamics. Furthermore, 'epiworldR' is ideal for simulation studies featuring large populations.

agents_smallworld *Load agents to a model*

Description

These functions provide access to the network of the model. The network is represented by an edgelist. The `agents_smallworld` function generates a small world network with the Watts-Strogatz algorithm. The `agents_from_edgelist` function loads a network from an edgelist. The `get_network` function returns the edgelist of the network.

Usage

```
agents_smallworld(model, n, k, d, p)
```

```
agents_from_edgelist(model, source, target, size, directed)
```

```
get_network(model)
```

```
get_agents_states(model)
```

```
add_virus_agent(agent, model, virus, state_new = -99, queue = -99)
```

```
add_tool_agent(agent, model, tool, state_new = -99, queue = -99)
```

```
has_virus(agent, virus)
```

```
has_tool(agent, tool)
```

```
change_state(agent, model, state_new, queue = -99)
```

```
get_agents_tools(model)
```

```
get_agents_viruses(model)
```

Arguments

model	Model object of class <code>epiworld_model</code> .
n, size	Number of individuals in the population.
k	Number of ties in the small world network.
d, directed	Logical scalar. Whether the graph is directed or not.
p	Probability of rewiring.
source, target	Integer vectors describing the source and target of in the edgelist.
agent	Agent object of class <code>epiworld_agent</code> .
virus	Virus object of class <code>epiworld_virus</code> .
state_new	Integer scalar. New state of the agent after the action is executed.
queue	Integer scalar. Change in the queuing system after the action is executed.
tool	Tool object of class <code>epiworld_tool</code> .

Details

The `new_state` and `queue` parameters are optional. If they are not provided, the agent will be updated with the default values of the virus/tool.

Value

- The `'agents_smallworld'` function returns a model with the agents loaded.
- The `agents_from_edgelist` function returns an empty model of class `epiworld_model`.
- The `get_network` function returns a data frame with two columns (`source` and `target`) describing the edgelist of the network.
- `get_agents_states` returns a character vector with the states of the agents by the end of the simulation.
- The function `add_virus_agent` adds a virus to an agent and returns the agent invisibly.
- The function `add_tool_agent` adds a tool to an agent and returns the agent invisibly.
- The functions `has_virus` and `has_tool` return a logical scalar indicating whether the agent has the virus/tool or not.

- `get_agents_tools` returns a list of class `epiworld_agents_tools` with `epiworld_tools` (list of lists).
- `get_agents_viruses` returns a list of class `epiworld_agents_viruses` with `epiworld_viruses` (list of lists).

Examples

```
# Initializing SIR model with agents_smallworld
sir <- ModelSIR(name = "COVID-19", prevalence = 0.01, transmission_rate = 0.9,
               recovery_rate = 0.1)
agents_smallworld(
  sir,
  n = 1000,
  k = 5,
  d = FALSE,
  p = .01
)
run(sir, ndays = 100, seed = 1912)
sir

# We can also retrieve the network
net <- get_network(sir)
head(net)

# Simulating a bernoulli graph
set.seed(333)
n <- 1000
g <- matrix(runif(n ^ 2) < .01, nrow = n)
diag(g) <- FALSE
el <- which(g, arr.ind = TRUE) - 1L

# Generating an empty model
sir <- ModelSIR("COVID-19", .01, .8, .3)
agents_from_edgelist(
  sir,
  source = el[,1],
  target = el[,2],
  size = n,
  directed = TRUE
)

# Running the simulation
run(sir, 50)

plot(sir)
```

Description

Models in `epiworld` are stored in a database. This database can be accessed using the functions described in this manual page. Some elements of the database are: the transition matrix, the incidence matrix, the reproductive number, the generation time, and daily incidence at the virus and tool level.

Usage

```

get_hist_total(x)

get_today_total(x)

get_hist_virus(x)

get_hist_tool(x)

get_transition_probability(x)

get_reproductive_number(x)

## S3 method for class 'epiworld_repnum'
plot(
  x,
  y = NULL,
  ylab = "Average Rep. Number",
  xlab = "Day (step)",
  main = "Reproductive Number",
  type = "b",
  plot = TRUE,
  ...
)

plot_reproductive_number(x, ...)

get_hist_transition_matrix(x, skip_zeros = FALSE)

## S3 method for class 'epiworld_hist_transition'
as.array(x, ...)

plot_incidence(x, ...)

## S3 method for class 'epiworld_hist_transition'
plot(
  x,

```

```

    type = "b",
    xlab = "Day (step)",
    ylab = "Counts",
    main = "Daily incidence",
    plot = TRUE,
    ...
)

get_transmissions(x)

get_generation_time(x)

## S3 method for class 'epiworld_generation_time'
plot(
  x,
  type = "b",
  xlab = "Day (step)",
  ylab = "Avg. Generation Time",
  main = "Generation Time",
  plot = TRUE,
  ...
)

plot_generation_time(x, ...)

```

Arguments

<code>x</code>	An object of class <code>epiworld_sir</code> , <code>epiworld_seir</code> , etc. any model.
<code>y</code>	Ignored.
<code>ylab</code> , <code>xlab</code> , <code>main</code> , <code>type</code>	Further parameters passed to <code>graphics::plot()</code>
<code>plot</code>	Logical scalar. If TRUE (default), the function will the desired statistic.
<code>...</code>	In the case of plot methods, further arguments passed to <code>graphics::plot</code> .
<code>skip_zeros</code>	Logical scalar. When FALSE it will return all the entries in the transition matrix.

Details

The `plot_reproductive_number` function is a wrapper around `get_reproductive_number` that plots the result.

The `plot_incidence` function is a wrapper between `get_hist_transition_matrix` and it's plot method.

The plot method for the `epiworld_hist_transition` class plots the daily incidence of each state. The function returns the data frame used for plotting.

Value

- The `get_hist_total` function returns an object of class `epiworld_hist_total`.

- The `get_today_total` function returns a named vector with the total number of individuals in each state at the end of the simulation.
- The `get_hist_virus` function returns an object of class `epiworld_hist_virus`.
- The `get_hist_tool` function returns an object of `epiworld_hist_virus`.
- The `get_transition_probability` function returns an object of class `matrix`.
- The `get_reproductive_number` function returns an object of class `epiworld_repnnum`.
- The `plot` function returns a plot of the reproductive number over time.
- `get_hist_transition_matrix` returns a `data.frame` with four columns: "state_from", "state_to", "date", and "counts."
- The `as.array` method for `epiworld_hist_transition` objects turns the `data.frame` returned by `get_hist_transition_matrix` into an array of `nstates x nstates x (ndays + 1)` entries, where the first entry is the initial state.
- The `plot_incidence` function returns a plot originating from the object `get_hist_transition_matrix`.
- The `plot` function returns a plot which originates from the `epiworld_hist_transition` object.
- The function `get_transmissions` returns a `data.frame` with the following columns: `date`, `source`, `target`, `virus_id`, `virus`, and `source_exposure_date`.
- The function `get_generation_time` returns a `data.frame` with the following columns: "agent", "virus_id", "virus", "date", and "gentime".
- The function `plot_generation_time` is a wrapper for `plot` and `get_generation_time`.

Examples

```
# SEIR Connected
seirconn <- ModelSEIRCONN(
  name           = "Disease",
  n              = 10000,
  prevalence     = 0.1,
  contact_rate   = 2.0,
  transmission_rate = 0.8,
  incubation_days = 7.0,
  recovery_rate  = 0.3
)
```

```
# Running the simulation for 50 steps (days)
set.seed(937)
run(seirconn, 50)

# Retrieving the transition probability
get_transition_probability(seirconn)

# Retrieving date, state, and counts dataframe including any added tools
get_hist_tool(seirconn)

# Retrieving overall date, state, and counts dataframe
head(get_hist_total(seirconn))

# Retrieving date, state, and counts dataframe by variant
head(get_hist_virus(seirconn))

# Retrieving (and plotting) the reproductive number
rp <- get_reproductive_number(seirconn)
plot(rp) # Also equivalent to plot_reproductive_number(seirconn)

# We can go further and get all the history
t_hist <- get_hist_transition_matrix(seirconn)

head(t_hist)

# And turn it into an array
as.array(t_hist)[,1:3]

# We can also get (and plot) the incidence, as well as
# the generation time
inci <- plot_incidence(seirconn)
gent <- plot_generation_time(seirconn)
```

Description

The functions described in this section are methods for objects of class `epiworld_model`. Besides of printing and plotting, other methods provide access to manipulate model parameters, getting information about the model and running the simulation.

Usage

```
queuing_on(x)
```

```
queuing_off(x)
```

```
verbose_off(x)
```

```
verbose_on(x)

run(model, ndays, seed = sample.int(10000, 1))

## S3 method for class 'epiworld_model'
summary(object, ...)

get_states(x)

get_param(x, pname)

set_param(x, pname, pval)

set_name(x, mname)

get_name(x)

get_n_viruses(x)

get_n_tools(x)

get_ndays(x)

get_n_replicates(x)

size(x)

set_agents_data(model, data)

get_agents_data_ncols(model)

get_virus(model, virus_pos)

get_tool(model, tool_pos)
```

Arguments

x	An object of class epiworld_model.
model	Model object.
ndays	Number of days (steps) of the simulation.
seed	Seed to set for initializing random number generator.
object	Object of class epiworld_model.
...	Additional arguments.
pname	String. Name of the parameter.
pval	Numeric. Value of the parameter.

mname	String. Name of the model.
data	A numeric matrix.
virus_pos	Integer. Relative location (starting from 0) of the virus in the model
tool_pos	Integer. Relative location (starting from 0) of the tool in the model

Details

The `verbose_on` and `verbose_off` functions activate and deactivate printing progress on screen, respectively. Both functions return the model (x) invisibly.

Value

- The `verbose_on` and `verbose_off` functions return the same model, however `verbose_off` returns the model with no progress bar.
- The `run` function returns the simulated model of class `epiworld_model`.
- The `summary` function prints a more detailed view of the model, and returns the same model invisibly.
- The `get_states` function returns the unique states found in a model.
- The `get_param` function returns a selected parameter from the model object of class `epiworld_model`.
- The `set_param` function does not return a value but instead alters a parameter value.
- The `set_name` function does not return a value but instead alters an object of `epiworld_model`.
- `get_name` returns the name of the model.
- `get_n_viruses` returns the number of viruses of the model.
- `get_n_tools` returns the number of tools of the model.
- `get_ndays` returns the number of days of the model.
- `get_n_replicates` returns the number of replicates of the model.
- `size.epiworld_model` returns the number of agents in the model.
- The `'set_agents_data'` function returns an object of class `DataFrame`.
- `'get_agents_data_ncols'` returns the number of columns in the model dataframe.
- `'get_virus'` returns a [virus](#).
- `get_tool` returns a [tool](#).

Examples

```

model_sirconn <- ModelSIRCONN(
  name           = "COVID-19",
  n             = 10000,
  prevalence    = 0.01,
  contact_rate  = 5,
  transmission_rate = 0.4,
  recovery_rate = 0.95
)

# Queuing - If you wish to implement the queuing function, declare whether
# you would like it "on" or "off", if any.
queuing_on(model_sirconn)
queuing_off(model_sirconn)
run(model_sirconn, ndays = 100, seed = 1912)

# Verbose - "on" prints the progress bar on the screen while "off"
# deactivates the progress bar. Declare which function you want to implement,
# if any.
verbose_on(model_sirconn)
verbose_off(model_sirconn)
run(model_sirconn, ndays = 100, seed = 1912)

get_states(model_sirconn) # Returns all unique states found within the model.

get_param(model_sirconn, 'Contact rate') # Returns the value of the selected
# parameter within the model object.
# In order to view the parameters,
# run the model object and find the
# "Model parameters" section.

set_param(model_sirconn, 'Contact rate', 2) # Allows for adjustment of model
# parameters within the model
# object. In this example, the
# Contact rate parameter is
# changed to 2. You can now rerun
# the model to observe any
# differences.

set_name(model_sirconn, 'My Epi-Model') # This function allows for setting
# a name for the model. Running the
# model object, the name of the model
# is now reflected next to "Name of
# the model".

get_name(model_sirconn) # Returns the set name of the model.

get_n_viruses(model_sirconn) # Returns the number of viruses in the model.
# In this case, there is only one virus:
# "COVID-19".

```

```

get_n_tools(model_sirconn) # Returns the number of tools in the model. In
                            # this case, there are zero tools.

get_ndays(model_sirconn) # Returns the length of the simulation in days. This
                          # will match "ndays" within the "run" function.

get_n_replicates(model_sirconn) # Returns the number of replicates of the
                                 # model.

size(model_sirconn) # Returns the population size in the model. In this case,
                   # there are 10,000 agents in the model.

# Set Agents Data
# First, your data matrix must have the same number of rows as agents in the
# model. Below is a generated matrix which will be passed into the
# "set_agents_data" function.
data <- matrix(data=runif(20000, min=0, max=100), nrow=10000, ncol=2)
set_agents_data(model_sirconn, data)
get_agents_data_ncols(model_sirconn) # Returns number of columns

get_virus(model_sirconn, 0) # Returns information about the first virus in
                             # the model (index begins at 0).

add_tool(model_sirconn, tool("Vaccine", .9, .9, .5, 1), proportion = .5)
get_tool(model_sirconn, 0) # Returns information about the first tool in the
                           # model. In this case, there are no tools so an
                           # error message will occur.

```

get_agents

Agents in epiworldR

Description

These functions provide read-access to the agents of the model. The `get_agents` function returns an object of class `epiworld_agents` which contains all the information about the agents in the model. The `get_agent` function returns the information of a single agent. And the `get_state` function returns the state of a single agent.

Usage

```

get_agents(model)

## S3 method for class 'epiworld_agents'
x[i]

## S3 method for class 'epiworld_agent'
print(x, compressed = FALSE, ...)

## S3 method for class 'epiworld_agents'
print(x, compressed = TRUE, max_print = 10, ...)

```

```
get_state(x)
```

Arguments

model	An object of class <code>epiworld_model</code> .
x	An object of class <code>epiworld_agents</code>
i	Index (id) of the agent (from 0 to n-1)
compressed	Logical scalar. When FALSE, it prints detailed information about the agent.
...	Ignored
max_print	Integer scalar. Maximum number of agents to print.

Value

- The `get_agents` function returns an object of class `epiworld_agents`.
- The `[]` method returns an object of class `epiworld_agent`.
- The `print` function returns information about each individual agent of class `epiworld_agent`.
- The `get_state` function returns the state of the `epiworld_agents` object.

See Also

`agents`

Examples

```
model_sirconn <- ModelSIRCONN(
  name           = "COVID-19",
  n              = 10000,
  prevalence     = 0.01,
  contact_rate   = 5,
  transmission_rate = 0.4,
  recovery_rate  = 0.95
)

run(model_sirconn, ndays = 100, seed = 1912)

x <- get_agents(model_sirconn) # Storing all agent information into object of
                               # class epiworld_agents

print(x, compressed = FALSE, max_print = 5) # Displaying detailed information of
                                             # the first 5 agents using
                                             # compressed=F. Using compressed=T
                                             # results in less-detailed
                                             # information about each agent.

x[0] # Print information about the first agent. Substitute the agent of
     # interest's position where '0' is.
```

global-actions	<i>Global Actions</i>
----------------	-----------------------

Description

Global actions are functions that are executed at each time step of the simulation. They are useful for implementing interventions, such as vaccination, isolation, and social distancing by means of tools.

Usage

```
globalaction_tool(tool, prob, name = get_name_tool(tool), day = -99)
```

```
globalaction_tool_logit(
  tool,
  vars,
  coefs,
  name = get_name_tool(tool),
  day = -99
)
```

```
globalaction_set_params(
  param,
  value,
  name = paste0("Set ", param, " to ", value),
  day = -99
)
```

```
globalaction_fun(fun, name = deparse(substitute(fun)), day = -99)
```

```
add_global_action(model, action)
```

Arguments

tool	An object of class tool .
prob	Numeric scalar. A probability between 0 and 1.
name	Character scalar. The name of the action.
day	Integer. The day (step) at which the action is executed (see details).
vars	Integer vector. The position of the variables in the model.
coefs	Numeric vector. The coefficients of the logistic regression.
param	Character scalar. The name of the parameter to be set.
value	Numeric scalar. The value of the parameter.
fun	Function. The function to be executed.
model	An object of class epiworld_model .
action	A global action.

Details

The function `globalaction_tool_logit` allows to specify a logistic regression model for the probability of using a tool. The model is specified by the vector of coefficients `coefs` and the vector of variables `vars`. `vars` is an integer vector indicating the position of the variables in the model.

The function `globalaction_set_param` allows to set a parameter of the model. The parameter is specified by its name `param` and the value by `value`.

The function `globalaction_fun` allows to specify a function to be executed at a given day. The function object must receive an object of class `epiworld_model` as only argument.

The function `add_global_action` adds a global action to a model. The model checks for actions to be executed at each time step. If the added action matches the current time step, the action is executed. When `day` is negative, the action is executed at each time step. When `day` is positive, the action is executed at the specified time step.

Value

- The `globalaction_set_params` function returns an object of class `epiworld_globalaction_set_param` and `epiworld_globalaction`.
- `globalaction_tool` returns an object of class `epiworld_globalaction_tool` and `epiworld_globalaction`.
- `globalaction_tool_logit` returns an object of class `epiworld_globalaction_tool_logit` and `epiworld_globalaction`.
- The function `add_global_action` returns the model with the added action.

ModelDiffNet

Network Diffusion Model

Description

The network diffusion model is a simple model that assumes that the probability of adoption of a behavior is proportional to the number of adopters in the network.

Usage

```

ModelDiffNet(
  name,
  prevalence,
  prob_adopt,
  normalize_exposure = TRUE,
  data = matrix(nrow = 0, ncol = 0),
  data_cols = 1L:ncol(data),
  params = vector("double")
)

## S3 method for class 'epiworld_diffnet'
plot(x, main = get_name(x), ...)

```

Arguments

name	Name of the model.
prevalence	Prevalence of the disease.
prob_adopt	Probability of adoption.
normalize_exposure	Normalize exposure.
data	Data.
data_cols	Data columns.
params	Parameters.
x	Object of class epiworld_diffnet .
main	Title of the plot
...	Passed to graphics::plot .

Details

Different from common epidemiological models, the network diffusion model assumes that the probability of adoption of a behavior is proportional to the number of adopters in the network. The model is defined by the following equations:

$$P(\text{adopt}) = \text{Logit}^{-1}(\text{prob_adopt} + \text{params} * \text{data} + \text{exposure})$$

Where exposure is the number of adopters in the agent's network.

Another important difference is that the transmission network is not necessary useful since adoption in this model is not from a particular neighbor.

Value

An object of class `epiworld_diffnet` and `epiworld_model`.

set.seed(2223)
n <- 10000

# Generating synthetic data on a matrix with 2 columns.
X <- cbind(
  age = sample(1:100, n, replace = TRUE),
  female = sample.int(2, n, replace = TRUE) - 1
)

adopt_chatgpt <- ModelDiffNet(
  "ChatGPT",
  prevalence = .01,
  prob_adopt = .1,
  data = X,
  params = c(1, 4)
)

# Simulating a population from smallworld
agents_smallworld(adopt_chatgpt, n, 8, FALSE, .01)

# Running the model for 50 steps
run(adopt_chatgpt, 50)

# Plotting the model
plot(adopt_chatgpt)
```

 ModelSEIR

Susceptible Exposed Infected Recovered model (SEIR)

Description

Susceptible Exposed Infected Recovered model (SEIR)

Usage

```
ModelSEIR(name, prevalence, transmission_rate, incubation_days, recovery_rate)
```

```
## S3 method for class 'epiworld_seir'
plot(x, main = get_name(x), ...)
```

Arguments

name	String. Name of the virus.
prevalence	Double. Initial proportion of individuals with the virus.
transmission_rate	Numeric scalar between 0 and 1. Virus's rate of infection.
incubation_days	Numeric scalar greater than 0. Average number of incubation days.
recovery_rate	Numeric scalar between 0 and 1. Rate of recovery_rate from virus.
x	Object of class SEIR.
main	Title of the plot
...	Currently ignore.

Value

- The ModelSEIRfunction returns a model of class [epiworld_model](#).

The plot function returns a plot of the SEIR model of class [epiworld_model](#).

ModelSIRLogit

SIR Logistic model

Description

SIR Logistic model

Usage

```
ModelSIRLogit(  
  vname,  
  data,  
  coefs_infect,  
  coefs_recover,  
  coef_infect_cols,  
  coef_recover_cols,  
  prob_infection,  
  recovery_rate,  
  prevalence  
)
```

Arguments

vname	Name of the virus.
data	A numeric matrix with n rows.
coefs_infect	Numeric vector. Coefficients associated to infect.
coefs_recover	Numeric vector. Coefficients associated to recover.
coef_infect_cols	Integer vector. Columns in the coefficient.
coef_recover_cols	Integer vector. Columns in the coefficient.
prob_infection	Numeric scalar. Baseline probability of infection.
recovery_rate	Numeric scalar. Baseline probability of recovery.
prevalence	Numeric scalar. Prevalence (initial state) in proportion.

Value

- The ModelSIRLogit function returns a model of class `epiworld_model`.

ModelSURV

SURV model

Description

SURV model

Usage

```
ModelSURV(
  name,
  prevalence,
  efficacy_vax,
  latent_period,
  infect_period,
  prob_symptoms,
  prop_vaccinated,
  prop_vax_redux_transm,
  prop_vax_redux_infect,
  surveillance_prob,
  transmission_rate,
  prob_death,
  prob_noreinfect
)

## S3 method for class 'epiworld_surv'
plot(x, main = get_name(x), ...)
```

Arguments

name	String. Name of the virus.
prevalence	Initial number of individuals with the virus.
efficacy_vax	Double. Efficacy of the vaccine. (1 - P(acquire the disease)).
latent_period	Double. Shape parameter of a 'Gamma(latent_period, 1)' distribution. This coincides with the expected number of latent days.
infect_period	Double. Shape parameter of a 'Gamma(infectious_period, 1)' distribution. This coincides with the expected number of infectious days.
prob_symptoms	Double. Probability of generating symptoms.
prop_vaccinated	Double. Probability of vaccination. Coincides with the initial prevalence of vaccinated individuals.
prop_vax_redux_transm	Double. Factor by which the vaccine reduces transmissibility.

prop_vax_redux_infect	Double. Factor by which the vaccine reduces the chances of becoming infected.
surveillance_prob	Double. Probability of testing an agent.
transmission_rate	Double. Raw transmission probability.
prob_death	Double. Raw probability of death for symptomatic individuals.
prob_noreinfect	Double. Probability of no re-infection.
x	Object of class SURV.
main	Title of the plot.
...	Currently ignore.

Value

- The ModelSURV function returns a model of class [epiworld_model](#).

The plot function returns a plot of the SURV model of class [epiworld_model](#).

```

```

    p = .01
  )

# Running and printing
run(model_surv, ndays = 100, seed = 1912)
model_surv

# Plotting
plot(model_surv, main = "SURV Model")

```

run_multiple

Run multiple simulations at once

Description

The `run_multiple` function allows running multiple simulations at once. When available, users can take advantage of parallel computing to speed up the process.

Usage

```

run_multiple(
  m,
  ndays,
  nsims,
  seed = sample.int(10000, 1),
  saver = make_saver(),
  reset = TRUE,
  verbose = TRUE,
  nthreads = 1L
)

run_multiple_get_results(m)

make_saver(..., fn = "")

```

Arguments

<code>m</code> , <code>ndays</code> , <code>seed</code>	See run .
<code>nsims</code>	Integer. Number of replicats
<code>saver</code>	An object of class epiworld_saver .
<code>reset</code>	When TRUE (default,) resets the simulation.
<code>verbose</code>	When TRUE (default,) prints a progress bar.
<code>nthreads</code>	Integer. Number of threads (parallel computing.)
<code>...</code>	List of strings (characters) specifying what to save (see details).
<code>fn</code>	A file name pattern.

Details

Currently, the following elements can be saved:

- total_hist History of the model (total numbers per time).
- virus_info Information about viruses.
- virus_hist Changes in viruses.
- tool_info Information about tools.
- tool_hist Changes in tools.
- transmission Transmission events.
- transition Transition matrices.
- reproductive Reproductive number.
- generation Estimation of generation time.

Value

- In the case of make_saver, an list of class epiworld_saver.
- The run_multiple function runs a specified number of simulations and returns a model object of class `epiworld_model`.
- The run_multiple_get_results function returns a named list with the data specified by make_saver.

Examples

```
model_sir <- ModelSIRCONN(  
  name = "COVID-19",  
  prevalence = 0.01,  
  n = 1000,  
  contact_rate = 2,  
  transmission_rate = 0.9, recovery_rate = 0.1  
)  
  
# Generating a saver  
saver <- make_saver("total_hist", "reproductive")  
  
# Running and printing  
run_multiple(model_sir, ndays = 100, nsims = 50, saver = saver, nthreads = 2)  
  
# Retrieving the results  
ans <- run_multiple_get_results(model_sir)  
  
head(ans$total_hist)  
head(ans$reproductive)  
  
# Plotting  
multi_sir <- run_multiple_get_results(model_sir)$total_hist  
multi_sir <- multi_sir[multi_sir$date <= 20,]  
plot(multi_sir)
```

tool	<i>Tools in epiworld</i>
------	--------------------------

Description

Tools are functions that affect how agents react to the virus. They can be used to simulate the effects of vaccination, isolation, and social distancing.

Usage

```
tool(  
  name,  
  susceptibility_reduction,  
  transmission_reduction,  
  recovery_enhancer,  
  death_reduction  
)  
  
set_name_tool(tool, name)  
  
get_name_tool(tool)  
  
add_tool(model, tool, proportion)  
  
add_tool_n(model, tool, n)  
  
rm_tool(model, tool_pos)  
  
rm_tool(model, tool_pos)  
  
tool_fun_logit(vars, coefs, model)  
  
set_susceptibility_reduction(tool, prob)  
  
set_susceptibility_reduction_ptr(tool, model, param)  
  
set_susceptibility_reduction_fun(tool, model, tfun)  
  
set_transmission_reduction(tool, prob)  
  
set_transmission_reduction_ptr(tool, model, param)  
  
set_transmission_reduction_fun(tool, model, tfun)  
  
set_recovery_enhancer(tool, prob)  
  
set_recovery_enhancer_ptr(tool, model, param)
```

```

set_recovery_enhancer_fun(tool, model, tfun)

set_death_reduction(tool, prob)

set_death_reduction_ptr(tool, model, param)

set_death_reduction_fun(tool, model, tfun)

## S3 method for class 'epiworld_agents_tools'
print(x, max_print = 10, ...)

```

Arguments

name	Name of the tool
susceptibility_reduction	Numeric. Proportion it reduces susceptibility.
transmission_reduction	Numeric. Proportion it reduces transmission.
recovery_enhancer	Numeric. Proportion it improves recovery.
death_reduction	Numeric. Proportion it reduces probability of death.
tool	An object of class <code>epiworld_tool</code>
model	Model
proportion	In the case of <code>add_tool</code> , a proportion, otherwise, an integer.
n	A positive integer. Number of agents to initially have the tool.
tool_pos	Positive integer. Index of the tool's position in the model.
vars	Integer vector. Indices (starting from 0) of the positions of the variables used to compute the logit probability.
coefs	Numeric vector. Of the same length of <code>vars</code> , is a vector of coefficients associated to the logit probability.
prob	Numeric scalar. A probability (between zero and one).
param	Character scalar. Name of the parameter featured in <code>model</code> that will be added to the tool (see details).
tfun	An object of class <code>epiworld_tool_fun</code> .
x	An object of class <code>epiworld_agents_tools</code> .
max_print	Numeric scalar. Maximum number of tools to print.
...	Currently ignored.

Details

The name of the `epiworld_tool` object can be manipulated with the functions `set_name_tool()` and `get_name_tool()`.

The `add_tool` function adds the specified tool to the model of class `epiworld_model` with specified proportion.

In the case of `set_susceptibility_reduction_ptr`, `set_transmission_reduction_ptr`, `set_recovery_enhancer`, and `set_death_reduction_ptr`, the corresponding parameters are passed as a pointer to the tool. The implication of using pointers is that the values will be read directly from the model object, so changes will be reflected.

Value

- The `tool` function creates a tool of class `epiworld_tool`.
- The `set_name_tool` function assigns a name to the tool of class `epiworld_tool` and returns the tool.
- The `get_name_tool` function returns the name of the tool of class `epiworld_tool`.
- The `add_tool_n` function adds the specified tool to the model of class `epiworld_model` with specified count `n`.
- The `rm_tool` function removes the specified tool from a model.
- The `set_susceptibility_reduction` function assigns a probability reduction to the specified tool of class `epiworld_tool`.
- The `set_transmission_reduction` function assigns a probability reduction to the specified tool of class `epiworld_tool`.
- The `set_recovery_enhancer` function assigns a probability increase to the specified tool of class `epiworld_tool`.
- The `set_death_reduction` function assigns a probability decrease to the specified tool of class `epiworld_tool`.

Examples

```
# Simple model
model_sirconn <- ModelSIRCONN(
  name           = "COVID-19",
  n              = 10000,
  prevalence     = 0.01,
  contact_rate   = 5,
  transmission_rate = 0.4,
  recovery_rate  = 0.95
)

# Running and printing
run(model_sirconn, ndays = 100, seed = 1912)
plot(model_sirconn)

epitool <- tool(

op <- par(mfrow = c(1, 2))
plot(hist_0); abline(v = 30)
plot(hist_1); abline(v = 30)
par(op)

```

Description

Viruses can be considered to be anything that can be transmitted (e.g., diseases, as well as ideas.) Most models in epiworldR can feature multiple viruses.

Usage

```
virus(  
  name,  
  prob_infecting,  
  recovery_rate = 0.5,  
  prob_death = 0,  
  post_immunity = -1,  
  incubation = 7  
)  
  
set_name_virus(virus, name)  
  
get_name_virus(virus)  
  
add_virus(model, virus, proportion)  
  
add_virus_n(model, virus, n)  
  
virus_set_state(virus, init, end, removed)  
  
rm_virus(model, virus_pos)  
  
virus_fun_logit(vars, coefs, model)  
  
set_prob_infecting(virus, prob)  
  
set_prob_infecting_ptr(virus, model, param)  
  
set_prob_infecting_fun(virus, model, vfun)  
  
set_prob_recovery(virus, prob)  
  
set_prob_recovery_ptr(virus, model, param)  
  
set_prob_recovery_fun(virus, model, vfun)  
  
set_prob_death(virus, prob)  
  
set_prob_death_ptr(virus, model, param)  
  
set_prob_death_fun(virus, model, vfun)  
  
set_incubation(virus, incubation)  
  
set_incubation_ptr(virus, model, param)  
  
set_incubation_fun(virus, model, vfun)
```

```
## S3 method for class 'epiworld_agents_viruses'
print(x, max_print = 10, ...)
```

Arguments

<code>name</code>	of the virus
<code>prob_infecting</code>	Numeric scalar. Probability of infection (transmission).
<code>recovery_rate</code>	Numeric scalar. Probability of recovery.
<code>prob_death</code>	Numeric scalar. Probability of death.
<code>post_immunity</code>	Numeric scalar. Post immunity (prob of re-infection).
<code>incubation</code>	Numeric scalar. Incubation period (in days) of the virus.
<code>virus</code>	An object of class <code>epiworld_virus</code>
<code>model</code>	An object of class <code>epiworld_model</code> .
<code>proportion</code>	In the case of <code>add_virus</code> , a proportion, otherwise, an integer.
<code>n</code>	A positive integer. Initial count of agents to have the virus.
<code>init, end, removed</code>	states after acquiring a virus, removing a virus, and removing the agent as a result of the virus, respectively.
<code>virus_pos</code>	Positive integer. Index of the virus's position in the model.
<code>vars</code>	Integer vector. Indices (starting from 0) of the positions of the variables used to compute the logit probability.
<code>coefs</code>	Numeric vector. Of the same length of <code>vars</code> , is a vector of coefficients associated to the logit probability.
<code>prob</code>	Numeric scalar. A probability (between zero and one).
<code>param</code>	Character scalar. Name of the parameter featured in <code>model</code> that will be added to the virus (see details).
<code>vfun</code>	An object of class <code>epiworld_virus_fun</code> .
<code>x</code>	An object of class <code>epiworld_agents_viruses</code> .
<code>max_print</code>	Numeric scalar. Maximum number of viruses to print.
<code>...</code>	Currently ignored.

Details

The `virus()` function can be used to initialize a virus. Virus features can then be modified using the functions `set_prob_*`.

The function `virus_fun_logit()` creates a "virus function" that can be evaluated for transmission, recovery, and death. As the name suggests, it computes those probabilities using a logit function (see examples).

The name of the `epiworld_virus` object can be manipulated with the functions `set_name_virus()` and `get_name_virus()`.

In the case of `set_prob_infecting_ptr`, `set_prob_recovery_ptr`, and `set_prob_death_ptr`, the corresponding parameters is passed as a pointer to the virus. The implication of using pointers is that the values will be read directly from the `model` object, so changes will be reflected.

Value

- The `set_name_virus` function does not return a value, but merely assigns a name to the virus of choice.
- The `get_name_virus` function returns the name of the virus of class `epiworld_virus`.
- The `add_virus` function does not return a value, instead it adds the virus of choice to the model object of class `epiworld_model`.
- The `add_virus_n` function does not return a value, but instead adds a specified number of agents with the virus of choice to the model object of class `epiworld_model`.
- The `virus_set_state` function does not return a value but assigns epidemiological properties to the specified virus of class `epiworld_virus`.
- The `rm_virus` function does not return a value, but instead removes a specified virus from the model of class `epiworld_model`.
- The `set_prob_infecting` function does not return a value, but instead assigns a probability to infection for the specified virus of class `epiworld_virus`.
- The `set_prob_recovery` function does not return a value, but instead assigns a probability to recovery for the specified virus of class `epiworld_virus`.
- The `set_prob_death` function does not return a value, but instead assigns a probability to death for the specified virus of class `epiworld_virus`.
- The `set_incubation` function does not return a value, but instead assigns an incubation period to the specified virus of class `epiworld_virus`.

Examples

```
mseirconn <- ModelSEIRCONN(
  name           = "COVID-19",
  prevalence     = 0.01,
  n              = 10000,
  contact_rate   = 4,
  incubation_days = 7,
  transmission_rate = 0.5,
  recovery_rate  = 0.99
)

delta <- virus("Delta Variant", 0, .5, .2, .01)

# Adding virus and setting/getting virus name
add_virus(mseirconn, delta, .3)
set_name_virus(delta, "COVID-19 Strain")
get_name_virus(delta)

run(mseirconn, ndays = 100, seed = 992)
mseirconn
```

```

rm_virus(mseirconn, 0) # Removing the first virus from the model object
add_virus_n(mseirconn, delta, 100) # Setting initial count of delta virus
# to n = 100

# Setting parameters for the delta virus manually
set_prob_infecting(delta, 0.5)
set_prob_recovery(delta, 0.9)
set_prob_death(delta, 0.01)
run(mseirconn, ndays = 100, seed = 992) # Run the model to observe changes

# If the states were (for example):
# 1: Infected
# 2: Recovered
# 3: Dead
delta2 <- virus("Delta Variant 2", 0, .5, .2, .01)
virus_set_state(delta2, 1, 2, 3)
# Using the logit function -----
sir <- ModelSIR(
  name = "COVID-19", prevalence = 0.01,
  transmission_rate = 0.9, recovery = 0.1
)

# Adding a small world population
agents_smallworld(
