

# Package ‘future.batchtools’

May 5, 2019

**Version** 0.8.0

**Depends** R (>= 3.2.0), future (>= 1.12.0)

**Imports** batchtools (>= 0.9.11)

**Suggests** future.apply, listenv, markdown, R.rsp

**VignetteBuilder** R.rsp

**Title** A Future API for Parallel and Distributed Processing using  
'batchtools'

**Description** Implementation of the Future API on top of the 'batchtools' package.  
This allows you to process futures, as defined by the 'future' package,  
in parallel out of the box, not only on your local machine or ad-hoc  
cluster of machines, but also via high-performance compute ('HPC') job  
schedulers such as 'LSF', 'OpenLava', 'Slurm', 'SGE', and 'TORQUE' / 'PBS',  
e.g. 'y <- future.apply::future\_lapply(files, FUN = process)'.

**License** LGPL (>= 2.1)

**LazyLoad** TRUE

**URL** <https://github.com/HenrikBengtsson/future.batchtools>

**BugReports** <https://github.com/HenrikBengtsson/future.batchtools/issues>

**RoxygenNote** 6.1.1

**NeedsCompilation** no

**Author** Henrik Bengtsson [aut, cre, cph]

**Maintainer** Henrik Bengtsson <henrikb@braju.com>

**Repository** CRAN

**Date/Publication** 2019-05-05 06:10:02 UTC

---

batchtools\_custom      *Batchtools futures for custom batchtools configuration*

---

## Description

Batchtools futures for custom batchtools configuration

## Usage

```
batchtools_custom(expr, envir = parent.frame(), substitute = TRUE,
  globals = TRUE, label = NULL, cluster.functions,
  resources = list(), workers = NULL, ...)
```

## Arguments

expr	The R expression to be evaluated
envir	The environment in which global environment should be located.
substitute	Controls whether expr should be substitute():d or not.
globals	(optional) a logical, a character vector, a named list, or a <a href="#">Globals</a> object. If TRUE, globals are identified by code inspection based on expr and tweak searching from environment envir. If FALSE, no globals are used. If a character vector, then globals are identified by lookup based their names globals searching from environment envir. If a named list or a Globals object, the globals are used as is.
label	(optional) Label of the future (where applicable, becomes the job name for most job schedulers).
cluster.functions	A <a href="#">ClusterFunctions</a> object.
resources	A named list passed to the batchtools template (available as variable resources).
workers	(optional) The maximum number of workers the batchtools backend may use at any time. Interactive and "local" backends can only process one future at the time, whereas HPC backends where futures are resolved via separate jobs on a scheduler, the default is to assume an infinite number of workers.
...	Additional arguments passed to <a href="#">BatchtoolsFuture()</a> .

## Value

An object of class BatchtoolsFuture.

## Examples

```
cf <- batchtools::makeClusterFunctionsInteractive(external = TRUE)
plan(batchtools_custom, cluster.functions = cf)

## Create explicit future
```

```
f <- future({
  cat("PID:", Sys.getpid(), "\n")
  42L
})
v <- value(f)
print(v)
```

---

batchtools\_local

*batchtools local and interactive futures*

---

## Description

A batchtools local future is an synchronous uniprocess future that will be evaluated in a background R session. A batchtools interactive future is an synchronous uniprocess future that will be evaluated in the current R session (and variables will be assigned to the calling environment rather than to a local one). Both types of futures will block until the futures are resolved.

## Usage

```
batchtools_local(expr, envir = parent.frame(), substitute = TRUE,
  globals = TRUE, label = NULL, workers = 1L, ...)
```

## Arguments

<code>expr</code>	The R expression to be evaluated
<code>envir</code>	The environment in which global environment should be located.
<code>substitute</code>	Controls whether <code>expr</code> should be <code>substitute():d</code> or not.
<code>globals</code>	(optional) a logical, a character vector, a named list, or a <a href="#">Globals</a> object. If <code>TRUE</code> , globals are identified by code inspection based on <code>expr</code> and tweak searching from environment <code>envir</code> . If <code>FALSE</code> , no globals are used. If a character vector, then globals are identified by lookup based their names <code>globals</code> searching from environment <code>envir</code> . If a named list or a <code>Globals</code> object, the globals are used as is.
<code>label</code>	(optional) Label of the future (where applicable, becomes the job name for most job schedulers).
<code>workers</code>	(optional) The maximum number of workers the batchtools backend may use at any time. Interactive and "local" backends can only process one future at the time, whereas HPC backends where futures are resolved via separate jobs on a scheduler, the default is to assume an infinite number of workers.
<code>...</code>	Additional arguments passed to <a href="#">BatchtoolsFuture()</a> .

**Details**

batchtools local futures rely on the batchtools backend set up by `batchtools::makeClusterFunctionsInteractive(external)` and batchtools interactive futures on the one set up by `batchtools::makeClusterFunctionsInteractive()`. These are supported by all operating systems.

An alternative to batchtools local futures is to use `cluster` futures of the **future** package with a single local background session, i.e. `plan(cluster, workers = "localhost")`.

An alternative to batchtools interactive futures is to use `transparent` futures of the **future** package.

**Value**

An object of class `BatchtoolsFuture`.

**Examples**

```
## Use local batchtools futures
plan(batchtools_local)

## A global variable
a <- 1

## Create explicit future
f <- future({
  b <- 3
  c <- 2
  a * b * c
})
v <- value(f)
print(v)

## Create implicit future
v %<-% {
  b <- 3
  c <- 2
  a * b * c
}
print(v)
```

---

batchtools\_template     *Batchtools futures for LSF, OpenLava, SGE, Slurm, TORQUE etc.*

---

**Description**

Batchtools futures for LSF, OpenLava, SGE, Slurm, TORQUE etc. are asynchronous multiprocess futures that will be evaluated on a compute cluster via a job scheduler.

**Usage**

```
batchtools_lsf(expr, envir = parent.frame(), substitute = TRUE,
  globals = TRUE, label = NULL, template = NULL,
  resources = list(), workers = Inf, ...)
```

```
batchtools_openlava(expr, envir = parent.frame(), substitute = TRUE,
  globals = TRUE, label = NULL, template = NULL,
  resources = list(), workers = Inf, ...)
```

```
batchtools_sge(expr, envir = parent.frame(), substitute = TRUE,
  globals = TRUE, label = NULL, template = NULL,
  resources = list(), workers = Inf, ...)
```

```
batchtools_slurm(expr, envir = parent.frame(), substitute = TRUE,
  globals = TRUE, label = NULL, template = NULL,
  resources = list(), workers = Inf, ...)
```

```
batchtools_torque(expr, envir = parent.frame(), substitute = TRUE,
  globals = TRUE, label = NULL, template = NULL,
  resources = list(), workers = Inf, ...)
```

**Arguments**

<code>expr</code>	The R expression to be evaluated
<code>envir</code>	The environment in which global environment should be located.
<code>substitute</code>	Controls whether <code>expr</code> should be <code>substitute()</code> d or not.
<code>globals</code>	(optional) a logical, a character vector, a named list, or a <a href="#">Globals</a> object. If <code>TRUE</code> , globals are identified by code inspection based on <code>expr</code> and tweak searching from environment <code>envir</code> . If <code>FALSE</code> , no globals are used. If a character vector, then <code>globals</code> are identified by lookup based their names <code>globals</code> searching from environment <code>envir</code> . If a named list or a <code>Globals</code> object, the <code>globals</code> are used as is.
<code>label</code>	(optional) Label of the future (where applicable, becomes the job name for most job schedulers).
<code>template</code>	(optional) A batchtools template file or a template string (in <b>brew</b> format). If not specified, it is left to the <b>batchtools</b> package to locate such file using its search rules.
<code>resources</code>	A named list passed to the batchtools template (available as variable <code>resources</code> ).
<code>workers</code>	(optional) The maximum number of workers the batchtools backend may use at any time. Interactive and "local" backends can only process one future at the time, whereas HPC backends where futures are resolved via separate jobs on a scheduler, the default is to assume an infinite number of workers.
<code>...</code>	Additional arguments passed to <a href="#">BatchtoolsFuture()</a> .

## Details

These type of batchtools futures rely on batchtools backends set up using the following **batchtools** functions:

- `batchtools::makeClusterFunctionsLSF()` for **Load Sharing Facility (LSF)**
- `batchtools::makeClusterFunctionsOpenLava()` for **OpenLava**
- `batchtools::makeClusterFunctionsSGE()` for **Sun/Oracle Grid Engine (SGE)**
- `batchtools::makeClusterFunctionsSlurm()` for **Slurm**
- `batchtools::makeClusterFunctionsTORQUE()` for **TORQUE / PBS**

## Value

An object of class `BatchtoolsFuture`.

---

`future.batchtools`      *future.batchtools: A Future for batchtools*

---

## Description

The **future.batchtools** package implements the Future API on top of **batchtools** such that futures can be resolved on for instance high-performance compute (HPC) clusters via job schedulers. The Future API is defined by the **future** package.

## Details

To use batchtools futures, load **future.batchtools**, and select the type of future you wish to use via `future::plan()`.

## Examples

```
plan(batchtools_local)
demo("mandelbrot", package = "future", ask = FALSE)

## Use local batchtools futures
plan(batchtools_local)

## A global variable
a <- 1

v %<-% {
  b <- 3
  c <- 2
  a * b * c
}

print(v)
```
