

Package ‘ggpointdensity’

August 28, 2019

Type Package

Title A Cross Between a 2D Density Plot and a Scatter Plot

Version 0.1.0

Description A cross between a 2D density plot and a scatter plot, implemented as a 'ggplot2' geom. Points in the scatter plot are colored by the number of neighboring points. This is useful to visualize the 2D-distribution of points in case of overplotting.

geom_pointdensity *A cross between a scatter plot and a 2D density plot*

Description

The pointdensity geom is used to create scatterplots where each point is colored by the number of neighboring points. This is useful to visualize the 2D-distribution of points in case of overplotting.

Usage

```
geom_pointdensity(mapping = NULL, data = NULL,
  stat = "pointdensity", position = "identity",
  ..., na.rm = FALSE, show.legend = NA,
  inherit.aes = TRUE)
```

Arguments

mapping	Set of aesthetic mappings created by <code>aes()</code> or <code>aes_()</code> . If specified and <code>inherit.aes = TRUE</code> (the default), it is combined with the default mapping at the top level of the plot. You must supply <code>mapping</code> if there is no plot mapping.
data	The data to be displayed in this layer. There are three options: If <code>NULL</code> , the default, the data is inherited from the plot data as specified in the call to <code>ggplot()</code> . A <code>data.frame</code> , or other object, will override the plot data. All objects will be fortified to produce a data frame. See <code>fortify()</code> for which variables will be created. A function will be called with a single argument, the plot data. The return value must be a <code>data.frame</code> , and will be used as the layer data. A function can be created from a formula (e.g. <code>~ head(.x, 10)</code>).
stat	The statistical transformation to use on the data for this layer, as a string.
position	Position adjustment, either as a string, or the result of a call to a position adjustment function.
...	Other arguments passed on to <code>layer()</code> . This includes <code>adjust</code> , a multiplicate bandwidth adjustment used to adjust the distance threshold to consider two points as neighbors, i.e. the radius around points in which neighbors are counted. For example, <code>adjust = 0.5</code> means use half of the default. Other arguments may be aesthetics, used to set an aesthetic to a fixed value, like <code>shape = 17</code> or <code>size = 3</code> . They may also be parameters to the paired geom/stat.
na.rm	If <code>FALSE</code> , the default, missing values are removed with a warning. If <code>TRUE</code> , missing values are silently removed.
show.legend	logical. Should this layer be included in the legends? <code>NA</code> , the default, includes if any aesthetics are mapped. <code>FALSE</code> never includes, and <code>TRUE</code> always includes. It can also be a named logical vector to finely select the aesthetics to display.
inherit.aes	If <code>FALSE</code> , overrides the default aesthetics, rather than combining with them. This is most useful for helper functions that define both data and aesthetics and shouldn't inherit behaviour from the default plot specification, e.g. <code>borders()</code> .

```
library(ggplot2)
library(dplyr)
library(ggpointdensity)

# generate some toy data
dat <- bind_rows(
  tibble(x = rnorm(7000, sd = 1),
         y = rnorm(7000, sd = 10),
         group = "foo"),
  tibble(x = rnorm(3000, mean = 1, sd = .5),
         y = rnorm(3000, mean = 7, sd = 5),
         group = "bar"))

# plot it with geom_pointdensity()
ggplot(data = dat, mapping = aes(x = x, y = y)) +
  geom_pointdensity()

# adjust the smoothing bandwidth,
# i.e. the radius around the points
# in which neighbors are counted
ggplot(data = dat, mapping = aes(x = x, y = y)) +
  geom_pointdensity(adjust = .1)

ggplot(data = dat, mapping = aes(x = x, y = y)) +
  geom_pointdensity(adjust = 4)

# I recommend the viridis package
# for a more useful color scale
library(viridis)
ggplot(data = dat, mapping = aes(x = x, y = y)) +
  geom_pointdensity() +
  scale_color_viridis()

# Of course you can combine the geom with standard
# ggplot2 features such as facets...
ggplot(data = dat, mapping = aes(x = x, y = y)) +
  geom_pointdensity() +
  scale_color_viridis() +
  facet_wrap(~ group)

# ... or point shape and size:
dat_subset <- sample_frac(dat, .1) # smaller data set
ggplot(data = dat_subset, mapping = aes(x = x, y = y)) +
```

```
geom_pointdensity(size = 3, shape = 17) +
  scale_color_viridis()

# Zooming into the axis works as well, keep in mind
# that xlim() and ylim() change the density since they
# remove data points.
# It may be better to use `coord_cartesian()` instead.
ggplot(data = dat, mapping = aes(x = x, y = y)) +
  geom_pointdensity() +
  scale_color_viridis() +
  xlim(c(-1, 3)) + ylim(c(-5, 15))

ggplot(data = dat, mapping = aes(x = x, y = y)) +
  geom_pointdensity() +
  scale_color_viridis() +
  coord_cartesian(xlim = c(-1, 3), ylim = c(-5, 15))
```
