Package 'googleCloudStorageR'

November 17, 2017

Type Package

Version 0.4.0

Title Interface with Google Cloud Storage API

Description Interact with Google Cloud Storage <https://cloud.google.com/storage/> API in R. Part of the 'cloudyr' <https://cloudyr.github.io/> project.

URL http://code.markedmondson.me/googleCloudStorageR/

BugReports https://github.com/cloudyr/googleCloudStorageR/issues

Depends R (>= 3.2.0)

Imports assertthat (>= 0.2.0), curl, googleAuthR (>= 0.6.2), httr (>= 1.2.1), jsonlite (>= 1.0), openssl, utils, yaml, zip

Suggests covr, googleComputeEngineR, knitr, readr, rmarkdown, testthat

License MIT + file LICENSE

R topics documented:

`gcs_auth` *Authenticate this session*

Description

A wrapper for gar_auth and gar_auth_service

Usage

```
gcs_auth(new_user = FALSE, no_auto = FALSE)
```

Arguments

`new_user`	If TRUE, reauthenticate via Google login screen
`no_auto`	Will ignore auto-authentication settings if TRUE

Details

If you have set the environment variable GCS_AUTH_FILE to a valid file location, the function will look there for authentication details. Otherwise it will look in the working directory for the '.httr-oauth' file, which if not present will trigger an authentication flow via Google login screen in your browser.

If GCS_AUTH_FILE is specified, then gcs_auth() will be called upon loading the package via library(googleCloudStorageR), meaning that calling this function yourself at the start of the session won't be necessary.

GCS_AUTH_FILE can be either a token generated by gar_auth or service account JSON ending with file extension .json

Value

Invisibly, the token that has been saved to the session

---

gcs_create_bucket *Create a new bucket*

Description

Create a new bucket in your project

Usage

```
gcs_create_bucket(name, projectId, location = "US",
  storageClass = c("MULTI_REGIONAL", "REGIONAL", "STANDARD", "NEARLINE",
  "COLDLINE", "DURABLE_REDUCED_AVAILABILITY"),
  predefinedAcl = c("projectPrivate", "authenticatedRead", "private",
  "publicRead", "publicReadWrite"),
  predefinedDefaultObjectAcl = c("bucketOwnerFullControl", "bucketOwnerRead",
  "authenticatedRead", "private", "projectPrivate", "publicRead"),
  projection = c("noAcl", "full"), versioning = FALSE, lifecycle = NULL)
```

Arguments

name	Globally unique name of bucket to create
projectId	A valid Google project id
location	Location of bucket. See details
storageClass	Type of bucket
predefinedAcl	Apply predefined access controls to bucket
predefinedDefaultObjectAcl	Apply predefined access controls to objects
projection	Properties to return. Default noAcl omits acl properties
versioning	Set if the bucket supports versioning of its objects
lifecycle	A list of gcs_create_lifecycle objects

Details

See here for details on location options

See Also

Other bucket functions: gcs_create_lifecycle, gcs_delete_bucket, gcs_get_bucket, gcs_get_global_bucket, gcs_global_bucket, gcs_list_buckets

---

gcs_create_bucket_acl *Create a Bucket Access Controls*

Description

Create a new access control at the bucket level

Usage

```
gcs_create_bucket_acl(bucket = gcs_get_global_bucket(), entity = "",
  entity_type = c("user", "group", "domain", "project", "allUsers",
  "allAuthenticatedUsers"), role = c("READER", "OWNER"))
```

Arguments

bucket	Name of a bucket, or a bucket object returned by gcs_create_bucket
entity	The entity holding the permission. Not needed for entity_type allUsers or allAuthenticatedUsers
entity_type	what type of entity
role	Access permission for entity Used also for when a bucket is updated

Value

Bucket access control object

See Also

Other Access control functions: gcs_get_bucket_acl, gcs_get_object_acl, gcs_update_object_acl

gcs_create_lifecycle *Create a lifecycle condition*

Description

Use this to set rules for how long objects last in a bucket in gcs_create_bucket

Usage

```
gcs_create_lifecycle(age = NULL, createdBefore = NULL,
  numNewerVersions = NULL, isLive = NULL)
```

Arguments

age	Age in days before objects are deleted
createdBefore	Deletes all objects before this date
numNewerVersions	Deletes all newer versions of this object
isLive	If TRUE deletes all live objects, if FALSE deletes all archived versions
	numNewerVersions and isLive works only for buckets with object versioning
	For multiple conditions, pass this object in as a list.

See Also

Lifecycle documentation https://cloud.google.com/storage/docs/lifecycle

Other bucket functions: gcs_create_bucket, gcs_delete_bucket, gcs_get_bucket, gcs_get_global_bucket, gcs_global_bucket, gcs_list_buckets

gcs_create_pubsub *Create a pub/sub notification for a bucket*

Description

Add a notification configuration that sends notifications for all supported events.

Usage

```
gcs_create_pubsub(topic, project, bucket = gcs_get_global_bucket(),
  event_types = NULL)
```

Arguments

topic	The pub/sub topic name
project	The project-id that has the pub/sub topic
bucket	The bucket for notifications
event_types	What events to activate, leave at default for all

Details

Cloud Pub/Sub notifications allow you to track changes to your Cloud Storage objects. As a minimum you wil need: the Cloud Pub/Sub API activated for the project; sufficient permissions on the bucket you wish to monitor; sufficient permissions on the project to receive notifications; an existing pub/sub topic; have given your service account at least `pubsub.publisher` permission.

See Also

https://cloud.google.com/storage/docs/reporting-changes

Other pubsub functions: gcs_delete_pubsub, gcs_get_service_email, gcs_list_pubsub

Examples

```
## Not run:

project <- "myproject"
bucket <- "mybucket"

# get the email to give access
gce_get_service_email(project)

# once email has access, create a new pub/sub topic for your bucket
gcs_create_pubsub("gcs_r", project, bucket)

## End(Not run)
```

---

gcs_delete_bucket *Delete a bucket*

Description

Delete the bucket, and all its objects

Usage

```
gcs_delete_bucket(bucket, ifMetagenerationMatch = NULL,
  ifMetagenerationNotMatch = NULL)
```

Arguments

bucket	Name of the bucket, or a bucket object
ifMetagenerationMatch	Delete only if metageneration matches
ifMetagenerationNotMatch	Delete only if metageneration does not match

See Also

Other bucket functions: gcs_create_bucket, gcs_create_lifecycle, gcs_get_bucket, gcs_get_global_bucket, gcs_global_bucket, gcs_list_buckets

---

gcs_delete_object *Delete an object*

Description

Deletes an object from a bucket

Usage

```
gcs_delete_object(object_name, bucket = gcs_get_global_bucket(),
  generation = NULL)
```

Arguments

object_name	Object to be deleted
bucket	Bucket to delete object from
generation	If present, deletes a specific version. Default if generation is NULL is to delete the latest version.

Value

If successful, TRUE.

See Also

Other object functions: gcs_get_object, gcs_list_objects, gcs_metadata_object

gcs_delete_pubsub *Delete pub/sub notifications for a bucket*

Description

Delete notification configurations for a bucket.

Usage

```
gcs_delete_pubsub(config_name, bucket = gcs_get_global_bucket())
```

Arguments

config_name	A name of a configuration
bucket	The bucket for notifications

Details

Cloud Pub/Sub notifications allow you to track changes to your Cloud Storage objects. As a minimum you wil need: the Cloud Pub/Sub API activated for the project; sufficient permissions on the bucket you wish to monitor; sufficient permissions on the project to receive notifications; an existing pub/sub topic; have given your service account at least `pubsub.publisher` permission.

See Also

https://cloud.google.com/storage/docs/reporting-changes

Other pubsub functions: gcs_create_pubsub, gcs_get_service_email, gcs_list_pubsub

gcs_download_url *Get the download URL*

Description

Create the download URL for objects in buckets

Usage

```
gcs_download_url(object_name, bucket = gcs_get_global_bucket(),
  public = FALSE)
```

Arguments

object_name	A vector of object names
bucket	A vector of bucket names
public	TRUE to return a public URL

Details

bucket names should be length 1 or same length as object_name

Download URLs can be either authenticated behind a login that you may need to update access for via gcs_update_object_acl, or public to all if their predefinedAcl = 'publicRead'

Use the public = TRUE to return the URL accessible to all, which changes the domain name from storage.cloud.google.com to storage.googleapis.com

Value

the URL for downloading objects

See Also

Other download functions: gcs_parse_download, gcs_signed_url

---

gcs_first *Save your R session to the cloud on startup/exit*

Description

Place within your .Rprofile to load and save your session data automatically

Usage

```
gcs_first(bucket = Sys.getenv("GCS_SESSION_BUCKET"))

gcs_last(bucket = Sys.getenv("GCS_SESSION_BUCKET"))
```

Arguments

bucket	The bucket holding your session data. See Details.

Details

The folder you want to save to Google Cloud Storage will also need to have a yaml file called _gcssave.yaml in the root of the directory. It can hold the following arguments:

Required bucket - the GCS bucket to save to

Optional loaddir - if the folder name is different to the current, where to load the R session from

Optional pattern - a regex of what files to save at the end of the session

Optional load_on_startup - if FALSE will not attempt to load on startup

The bucket name is also set via the environment arg `GCE_SESSION_BUCKET`. The yaml bucket name will take precedence if both are set.

The folder is named on GCS the full working path to the working directory e.g. `/Users/mark/dev/your-r-project` which is what is looked for on startup. If you create a new R project with the same filepath and bucket as an existing saved set, the files will download automatically when you load R from that folder (when starting an RStudio project).

If you load from a different filepath (e.g. with `loadir` set in yaml), when you exit and save the files will be saved under your new present working directory.

Files with the same name will not be overwritten. If you want them to be, delete or rename them then reload the R session.

This function does not act like git, or intended as a replacement - its main use is imagined to be for using RStudio Server within disposable Docker containers on Google Cloud Engine (e.g. via `googleComputeEngineR`)

For authentication for GCS, the easiest way is to make sure your authentication file is available in environment file `GCS_AUTH_FILE`, or if on Google Compute Engine it will reuse the Google Cloud authentication via gar_gce_auth

See Also

gcs_save_all and gcs_load_all that these functions call

gcs_save_all and gcs_load_all that these functions call

Examples

```
## Not run:

.First <- function(){
  googleCloudStorageR::gcs_first()
}

.Last <- function(){
  googleCloudStorageR::gcs_last()
}

## End(Not run)
```

`gcs_get_bucket` *Get bucket info*

Description

Meta data about the bucket

Usage

```
gcs_get_bucket(bucket = gcs_get_global_bucket(),
  ifMetagenerationMatch = NULL, ifMetagenerationNotMatch = NULL,
  projection = c("noAcl", "full"))
```

Arguments

bucket	Name of a bucket, or a bucket object returned by gcs_create_bucket
ifMetagenerationMatch	Return only if metageneration matches
ifMetagenerationNotMatch	Return only if metageneration does not match
projection	Properties to return. Default noAcl omits acl properties

Value

A bucket resource object

See Also

Other bucket functions: gcs_create_bucket, gcs_create_lifecycle, gcs_delete_bucket, gcs_get_global_bucket, gcs_global_bucket, gcs_list_buckets

Examples

```
## Not run:

buckets <- gcs_list_buckets("your-project")

## use the name of the bucket to get more meta data
bucket_meta <- gcs_get_bucket(buckets$name[[1]])

## End(Not run)
```

---

gcs_get_bucket_acl *Get Bucket Access Controls*

Description

Returns the ACL entry for the specified entity on the specified bucket

Usage

```
gcs_get_bucket_acl(bucket = gcs_get_global_bucket(), entity = "",
  entity_type = c("user", "group", "domain", "project", "allUsers",
  "allAuthenticatedUsers"))
```

Arguments

bucket	Name of a bucket, or a bucket object returned by gcs_create_bucket
entity	The entity holding the permission. Not needed for entity_type allUsers or allAuthenticatedUsers
entity_type	what type of entity Used also for when a bucket is updated

Value

Bucket access control object

See Also

Other Access control functions: gcs_create_bucket_acl, gcs_get_object_acl, gcs_update_object_acl

---

gcs_get_global_bucket *Get global bucket name*

Description

Bucket name set this session to use by default

Usage

```
gcs_get_global_bucket()
```

Details

Set the bucket name via gcs_global_bucket

Value

Bucket name

See Also

Other bucket functions: gcs_create_bucket, gcs_create_lifecycle, gcs_delete_bucket, gcs_get_bucket, gcs_global_bucket, gcs_list_buckets

gcs_get_object *Get an object in a bucket directly*

Description

This retrieves an object directly.

Usage

```
gcs_get_object(object_name, bucket = gcs_get_global_bucket(), meta = FALSE,
  saveToDisk = NULL, overwrite = FALSE, parseObject = TRUE,
  parseFunction = gcs_parse_download)
```

Arguments

object_name	name of object in the bucket that will be URL encoded, or a gs:// URL
bucket	bucket containing the objects. Not needed if using a gs:// URL
meta	If TRUE then get info about the object, not the object itself
saveToDisk	Specify a filename to save directly to disk
overwrite	If saving to a file, whether to overwrite it
parseObject	If saveToDisk is NULL, whether to parse with parseFunction
parseFunction	If saveToDisk is NULL, the function that will parse the download. Defaults to gcs_parse_download

Details

This differs from providing downloads via a download link as you can do via gcs_download_url

object_name can use a gs:// URI instead, in which case it will take the bucket name from that URI and bucket argument will be overridden. The URLs should be in the form gs://bucket/object/name

By default if you want to get the object straight into an R session the parseFunction is gcs_parse_download which wraps httr's content.

If you want to use your own function (say to unzip the object) then supply it here. The first argument should take the downloaded object.

Value

The object, or TRUE if successfully saved to disk.

See Also

Other object functions: gcs_delete_object, gcs_list_objects, gcs_metadata_object

Examples

```
## Not run:

## something to download
## data.frame that defaults to be called "mtcars.csv"
gcs_upload(mtcars)

## get the mtcars csv from GCS, convert it to an R obj
gcs_get_object("mtcars.csv")

## get the mtcars csv from GCS, save it to disk
gcs_get_object("mtcars.csv", saveToDisk = "mtcars.csv")

## default gives a warning about missing column name.
## custom parse function to suppress warning
f <- function(object){
  suppressWarnings(httr::content(object, encoding = "UTF-8"))
}

## get mtcars csv with custom parse function.
gcs_get_object("mtcars_meta.csv", parseFunction = f)

## End(Not run)
```

---

gcs_get_object_acl *Check the access control settings for an object for one entity*

Description

Returns the default object ACL entry for the specified entity on the specified bucket.

Usage

```
gcs_get_object_acl(object_name, bucket = gcs_get_global_bucket(),
  entity = "", entity_type = c("user", "group", "domain", "project",
  "allUsers", "allAuthenticatedUsers"), generation = NULL)
```

Arguments

object_name	Name of the object
bucket	Name of a bucket
entity	The entity holding the permission. Not needed for entity_type allUsers or allAuthenticatedUsers
entity_type	The type of entity
generation	If present, selects a spcfic revision of the object

See Also

Other Access control functions: gcs_create_bucket_acl, gcs_get_bucket_acl, gcs_update_object_acl

---

`gcs_get_service_email` *Get the email of service account associated with the bucket*

Description

Use this to get the right email so you can give it `pubsub.publisher` permission.

Usage

```
gcs_get_service_email(project)
```

Arguments

`project`	The project name containing the bucket

Details

This service email can be different from the email in the service JSON. Give this `pubsub.publisher` permission in the Google cloud console.

See Also

Other pubsub functions: gcs_create_pubsub, gcs_delete_pubsub, gcs_list_pubsub

---

`gcs_global_bucket` *Set global bucket name*

Description

Set a bucket name used for this R session

Usage

```
gcs_global_bucket(bucket)
```

Arguments

`bucket`	bucket name you want this session to use by default, or a bucket object

Details

This sets a bucket to a global environment value so you don't need to supply the bucket argument to other API calls.

Value

The bucket name (invisibly)

See Also

Other bucket functions: gcs_create_bucket, gcs_create_lifecycle, gcs_delete_bucket, gcs_get_bucket, gcs_get_global_bucket, gcs_list_buckets

---

`gcs_list_buckets` *List buckets*

Description

List the buckets your projectId has access to

Usage

```
gcs_list_buckets(projectId, prefix = "", projection = c("noAcl", "full"),
  maxResults = 1000, detail = c("summary", "full"))
```

Arguments

`projectId`	Project containing buckets to list
`prefix`	Filter results to names beginning with this prefix
`projection`	Properties to return. Default noAcl omits acl properties
`maxResults`	Max number of results
`detail`	Set level of detail

Details

Columns returned by `detail` are:

- `summary` - name, storageClass, location ,updated
- `full` - as above plus: id, selfLink, projectNumber, timeCreated, metageneration, etag

Value

`data.frame` of buckets

See Also

Other bucket functions: gcs_create_bucket, gcs_create_lifecycle, gcs_delete_bucket, gcs_get_bucket, gcs_get_global_bucket, gcs_global_bucket

Examples

```
## Not run:

buckets <- gcs_list_buckets("your-project")

## use the name of the bucket to get more meta data
bucket_meta <- gcs_get_bucket(buckets$name[[1]])

## End(Not run)
```

`gcs_list_objects` *List objects in a bucket*

Description

List objects in a bucket

Usage

```
gcs_list_objects(bucket = gcs_get_global_bucket(), detail = c("summary",
  "more", "full"), prefix = NULL, delimiter = NULL)
```

Arguments

`bucket`	bucket containing the objects
`detail`	Set level of detail
`prefix`	Filter results to objects whose names begin with this prefix
`delimiter`	Use to list objects like a directory listing.

Details

Columns returned by `detail` are:

- `summary` - name, size, updated
- `more` - as above plus: bucket, contentType, storageClass, timeCreated
- `full` - as above plus: id, selfLink, generation, metageneration, md5Hash, mediaLink, crc32c, etag

`delimited` returns results in a directory-like mode: items will contain only objects whose names, aside from the prefix, do not contain delimiter. In conjunction with the prefix filter, the use of the delimiter parameter allows the list method to operate like a directory listing, despite the object namespace being flat. For example, if delimiter were set to `"/"`, then listing objects from a bucket that contains the objects `"a/b"`, `"a/c"`, `"dddd"`, `"eeee"`, `"e/f"` would return objects `"dddd"` and `"eeee"`, and prefixes `"a/"` and `"e/"`.

Value

A data.frame of the objects

See Also

Other object functions: gcs_delete_object, gcs_get_object, gcs_metadata_object

---

`gcs_list_pubsub` *List pub/sub notifications for a bucket*

Description

List notification configurations for a bucket.

Usage

```
gcs_list_pubsub(bucket = gcs_get_global_bucket())
```

Arguments

`bucket`	The bucket for notifications

Details

Cloud Pub/Sub notifications allow you to track changes to your Cloud Storage objects. As a minimum you wil need: the Cloud Pub/Sub API activated for the project; sufficient permissions on the bucket you wish to monitor; sufficient permissions on the project to receive notifications; an existing pub/sub topic; have given your service account at least `pubsub.publisher` permission.

See Also

https://cloud.google.com/storage/docs/reporting-changes

Other pubsub functions: gcs_create_pubsub, gcs_delete_pubsub, gcs_get_service_email

`gcs_load` *Load .RData objects or sessions from the Google Cloud*

Description

Load R objects that have been saved using gcs_save or gcs_save_image

Usage

```
gcs_load(file = ".RData", bucket = gcs_get_global_bucket(),
  envir = .GlobalEnv, saveToDisk = file, overwrite = TRUE)
```

Arguments

`file`	Where the files are stored
`bucket`	Bucket the stored objects are in
`envir`	Environment to load objects into
`saveToDisk`	Where to save the loaded file. Default same file name
`overwrite`	If file exists, overwrite. Default TRUE.

Details

The argument `file`'s default is to load an image file called `.RData` from gcs_save_image into the Global environment.

This would overwrite your existing `.RData` file in the working directory, so change the file name if you don't wish this to be the case.

Value

TRUE if successful

See Also

Other R session data functions: `gcs_save_all`, `gcs_save_image`, `gcs_save`, `gcs_source`

`gcs_metadata_object` *Make metadata for an object*

Description

Use this to pass to uploads in gcs_upload

Usage

```
gcs_metadata_object(object_name = NULL, metadata = NULL, md5Hash = NULL,
  crc32c = NULL, contentLanguage = NULL, contentEncoding = NULL,
  contentDisposition = NULL, cacheControl = NULL)
```

Arguments

`object_name`	Name of the object. GCS uses this version if also set elsewhere.
`metadata`	User-provided metadata, in key/value pairs
`md5Hash`	MD5 hash of the data; encoded using base64
`crc32c`	CRC32c checksum, as described in RFC 4960, Appendix B; encoded using base64 in big-endian byte order
`contentLanguage`	Content-Language of the object data
`contentEncoding`	Content-Encoding of the object data
`contentDisposition`	Content-Disposition of the object data
`cacheControl`	Cache-Control directive for the object data

Value

Object metadata for uploading of class `gar_Object`

See Also

Other object functions: `gcs_delete_object`, `gcs_get_object`, `gcs_list_objects`

gcs_parse_download *Parse downloaded objects straight into R*

Description

Wrapper for `httr`'s content. This is the default function used in gcs_get_object

Usage

```
gcs_parse_download(object, encoding = "UTF-8")
```

Arguments

`object`	The object downloaded
`encoding`	Default to UTF-8

See Also

gcs_get_object

Other download functions: `gcs_download_url`, `gcs_signed_url`

gcs_retry_upload *Retry a resumeable upload*

Description

Used internally in gcs_upload, you can also use this for failed uploads within one week of generating the upload URL

Usage

```
gcs_retry_upload(retry_object = NULL, upload_url = NULL, file = NULL,
  type = NULL)
```

Arguments

`retry_object`	A object of class `gcs_upload_retry`.
`upload_url`	As created in a failed upload via gcs_upload
`file`	The file location to upload
`type`	The file type, guessed if NULL
	Either supply a retry object, or the upload_url, file and type manually yourself.
	The function will first check to see how much has been uploaded already, then try to send up the remaining bytes.

Value

If successful, an object metadata object, if not an gcs_upload_retry object.

`gcs_save` *Save .RData objects to the Google Cloud*

Description

Performs save then saves it to Google Cloud Storage.

Usage

```
gcs_save(..., file, bucket = gcs_get_global_bucket(),
  envir = parent.frame())
```

Arguments

`...`	The names of the objects to be saved (as symbols or character strings).
`file`	The file name that will be uploaded (conventionally with file extension `.RData`)
`bucket`	Bucket to store objects in
`envir`	Environment to search for objects to be saved

Details

For all session data use gcs_save_image instead.

`gcs_save(ob1, ob2, ob3, file = "mydata.RData")` will save the objects specified to an `.RData` file then save it to Cloud Storage, to be loaded later using gcs_load.

For any other use, its better to use gcs_upload and gcs_get_object instead.

Restore the R objects using `gcs_load(bucket = "your_bucket")`

This will overwrite any data within your local environment with the same name.

Value

The GCS object

See Also

Other R session data functions: `gcs_load`, `gcs_save_all`, `gcs_save_image`, `gcs_source`

`gcs_save_all` *Save/Load all files in directory to Google Cloud Storage*

Description

This function takes all the files in the directory, zips them, and saves/loads/deletes them to the cloud. The upload name will be the directory name.

Usage

```
gcs_save_all(directory = getwd(), bucket = gcs_get_global_bucket(),
  pattern = "")

gcs_load_all(directory = getwd(), bucket = gcs_get_global_bucket(),
  exdir = directory, list = FALSE)

gcs_delete_all(directory = getwd(), bucket = gcs_get_global_bucket())
```

Arguments

`directory`	The folder to upload/download
`bucket`	Bucket to store within
`pattern`	An optional regular expression. Only file names which match the regular expression will be saved.
`exdir`	When downloading, specify a destination directory if required
`list`	When downloading, only list where the files would unzip to

Details

Zip/unzip is performed before upload and after download.

Value

When uploading the GCS meta object; when downloading `TRUE` if successful

See Also

Other R session data functions: `gcs_load`, `gcs_save_image`, `gcs_save`, `gcs_source`

gcs_save_image *Save an R session to the Google Cloud*

Description

Performs save.image then saves it to Google Cloud Storage.

Usage

```
gcs_save_image(file = ".RData", bucket = gcs_get_global_bucket(),
  saveLocation = NULL, envir = parent.frame())
```

Arguments

file	Where to save the file in GCS and locally
bucket	Bucket to store objects in
saveLocation	Which folder in the bucket to save file
envir	Environment to save from

Details

`gcs_save_image(bucket = "your_bucket")` will save all objects in the workspace to `.RData` folder on Google Cloud Storage within `your_bucket`.

Restore the objects using `gcs_load(bucket = "your_bucket")`

This will overwrite any data with the same name in your current local environment.

Value

The GCS object

See Also

Other R session data functions: gcs_load, gcs_save_all, gcs_save, gcs_source

gcs_signed_url *Create a signed URL*

Description

This creates a signed URL which you can share with others who may or may not have a Google account. The object will be available until the specified timestamp.

Usage

```
gcs_signed_url(meta_obj, expiration_ts = Sys.time() + 3600, verb = "GET",
  md5hash = NULL, includeContentType = FALSE)
```

Arguments

meta_obj	A meta object from gcs_get_object
expiration_ts	A timestamp of class "POSIXct" such as from Sys.time() or a numeric in seconds from Unix Epoch. Default is 60 mins.
verb	The URL verb of access e.g. GET or PUT. Default GET
md5hash	An optional md5 digest value
includeContentType	For getting the URL via browsers this should be set to FALSE (the default). Otherwise, set to TRUE to include the content type of the object in the request needed.

Details

Create a URL with a time-limited read and write to an object, regardless whether they have a Google account

See Also

https://cloud.google.com/storage/docs/access-control/signed-urls

Other download functions: gcs_download_url, gcs_parse_download

Examples

```
## Not run:

obj <- gcs_get_object("your_file", meta = TRUE)

signed <- gcs_signed_url(obj)

temp <- tempfile()
on.exit(unlink(temp))

download.file(signed, destfile = temp)
file.exists(temp)

## End(Not run)
```

gcs_source *Source an R script from the Google Cloud*

Description

Download an R script and run it immediately via source

Usage

```
gcs_source(script, bucket = gcs_get_global_bucket(), ...)
```

Arguments

script	The name of the script on GCS
bucket	Bucket the stored objects are in
...	Passed to source

Value

TRUE if successful

See Also

gcs_update_object_acl *Change access to an object in a bucket*

Description

Updates Google Cloud Storage ObjectAccessControls

Usage

```
gcs_update_object_acl(object_name, bucket = gcs_get_global_bucket(),
  entity = "", entity_type = c("user", "group", "domain", "project",
  "allUsers", "allAuthenticatedUsers"), role = c("READER", "OWNER"))
```

Arguments

object_name	Object to update
bucket	Google Cloud Storage bucket
entity	entity to update or add, such as an email
entity_type	what type of entity
role	Access permission for entity

Details

An `entity` is an identifier for the `entity_type`.

- `entity="user"` may have `userId` or `email`
- `entity="group"` may have `groupId` or `email`
- `entity="domain"` may have `domain`
- `entity="project"` may have `team-projectId`

For example:

- `entity="user"` could be `jane@doe.com`
- `entity="group"` could be `example@googlegroups.com`
- `entity="domain"` could be `example.com` which is a Google Apps for Business domain.

Value

TRUE if successful

`gcs_upload` *Upload a file of arbitrary type*

Description

Upload up to 5TB

Usage

```
gcs_upload(file, bucket = gcs_get_global_bucket(), type = NULL,
  name = deparse(substitute(file)), object_function = NULL,
  object_metadata = NULL, predefinedAcl = c("private", "authenticatedRead",
  "bucketOwnerFullControl", "bucketOwnerRead", "projectPrivate", "publicRead"),
  upload_type = c("simple", "resumable"))
```

Arguments

file	data.frame, list, R object or filepath (character) to upload file
bucket	bucketname you are uploading to
type	MIME type, guessed from file extension if NULL
name	What to call the file once uploaded. Default is the filepath
object_function	If not NULL, a function(input, output)
object_metadata	Optional metadata for object created via gcs_metadata_object
predefinedAcl	Specify user access to object. Default is 'private'
upload_type	Override automatic decision on upload type

Details

When using object_function it expects a function with two arguments:

- input The object you supply in file to write from
- output The filename you write to

By default the upload_type will be 'simple' if under 5MB, 'resumable' if over 5MB. 'Multipart' upload is used if you provide a object_metadata.

If object_function is NULL and file is not a character filepath, the defaults are:

- file's class is data.frame - write.csv
- file's class is list - toJSON

If object_function is not NULL and file is not a character filepath, then object_function will be applied to the R object specified in file before upload. You may want to also use name to ensure the correct file extension is used e.g. name = 'myobject.feather'

If file or name argument contains folders e.g. /data/file.csv then the file will be uploaded with the same folder structure e.g. in a /data/ folder. Use name to override this.

Value

If successful, a metadata object

scopes

Requires scopes https://www.googleapis.com/auth/devstorage.read_write or https://www.googleapis.com/auth

Examples

```
## Not run:

## set global bucket so don't need to keep supplying in future calls
gcs_global_bucket("my-bucket")

## by default will convert dataframes to csv
gcs_upload(mtcars)

## mtcars has been renamed to mtcars.csv
gcs_list_objects()

## to specify the name, use the name argument
gcs_upload(mtcars, name = "my_mtcars.csv")

## when looping, its best to specify the name else it will take
## the deparsed function call e.g. X[[i]]
my_files <- list.files("my_uploads")
lapply(my_files, function(x) gcs_upload(x, name = x))

## you can supply your own function to transform R objects before upload
f <- function(input, output){
  write.csv2(input, file = output)
}

gcs_upload(mtcars, name = "mtcars_csv2.csv", object_function = f)

## End(Not run)
```

---

googleCloudStorageR *googleCloudStorageR*

Description

Interact with Google Cloud Storage API in R. Part of the 'cloudyr' project.
