Package ‘h2o’

May 23, 2021

Version 3.32.1.3
Type Package
Title R Interface for the 'H2O' Scalable Machine Learning Platform
Date 2021-05-19
Description R interface for 'H2O', the scalable open source machine learning platform that offers parallelized implementations of many supervised and unsupervised machine learning algorithms such as Generalized Linear Models (GLM), Gradient Boosting Machines (including XGBoost), Random Forests, Deep Neural Networks (Deep Learning), Stacked Ensembles, Naive Bayes, Generalized Additive Models (GAM), Cox Proportional Hazards, K-Means, PCA, Word2Vec, as well as a fully automatic machine learning algorithm (H2O AutoML).
License Apache License (== 2.0)
URL https://github.com/h2oai/h2o-3
BugReports https://h2oai.atlassian.net/projects/PUBDEV
NeedsCompilation no
SystemRequirements Java (>= 8, < 16)
Depends R (>= 2.13.0), methods, stats
Imports graphics, tools, utils, RCurl, jsonlite
Suggests ggplot2 (>= 3.3.0), mlbench, Matrix, slam, bit64 (>= 0.9.7), data.table (>= 1.9.8), rgl (>= 0.100.19), plot3Drgl (>= 1.0.1), survival, DT, IRdisplay, htmltools, plotly, repr
Collate 'aggregator.R' 'astfun.R' 'automl.R' 'classes.R' 'config.R'
'connection.R' 'constants.R' 'datasets.R' 'logging.R'

**Index** 401
Description

This is a package for running H2O via its REST API from within R. To communicate with a H2O instance, the version of the R package must match the version of H2O. When connecting to a new H2O cluster, it is necessary to re-run the initializer.

Details

Package: h2o
Type: Package
Version: 3.32.1.3
Branch: rel-zipf
Date: Wed May 19 18:02:50 UTC 2021
License: Apache License (== 2.0)
Depends: R (>= 2.13.0), RCurl, jsonlite, statmod, tools, methods, utils

H2O is the scalable open source machine learning platform that offers parallelized implementations of many supervised and unsupervised machine learning algorithms such as Generalized Linear Models (GLM), Gradient Boosting Machines (including XGBoost), Random Forests, Deep Neural Networks (Deep Learning), Stacked Ensembles, Naive Bayes, Generalized Additive Models (GAM), Cox Proportional Hazards, K-Means, PCA, Word2Vec, as well as a fully automatic machine learning algorithm (H2O AutoML). As an example, to run GLM, call `h2o.glm` with the H2O parsed data and parameters (response variable, error distribution, etc.) as arguments.

This package enables the use of the H2O machine learning platform commands in R. To use H2O from R, you must start or connect to the "H2O cluster", the term we use to describe the backend H2O Java engine. To run H2O on your local machine, call `h2o.init` without any arguments, and H2O will be automatically launched at localhost:54321, where the IP is "127.0.0.1" and the port is 54321. If you have the H2O cluster running on a remote machine (e.g. AWS EC2), you must provide the IP and port of the remote machine as arguments to the `h2o.init` call.

Note that no actual data is stored in the R workspace; and no actual work is carried out by R. R only saves the named objects, which uniquely identify the data set, model, etc on the server. When the user makes a request, R queries the server via the REST API, which returns a JSON file with the relevant information that R then displays in the console.

.addParm

**Description**

Append a <key,value> pair to a list.

**Usage**

```r
.addParm(parms, k, v)
```

**Arguments**

- `parms`: a list to add the <k,v> pair to
- `k`: a key, typically the name of some algorithm parameter
- `v`: a value, the value of the algorithm parameter

**Details**

Contained here are a set of helper methods that perform type checking on the value passed in.

---

.check_for_ggplot2

**Description**

Stop with a user friendly message if a user is missing the ggplot2 package or has an old version of it.

**Usage**

```r
.check_for_ggplot2(version = "3.0.0")
```

**Arguments**

- `version`: minimal required ggplot2 version
.collapse  

**Helper Collapse Function**

**Description**

Collapse a character vector into a `','`-sep array of the form: [thing1,thing2,...]

**Usage**

```r
.collapse(v)
```

**Arguments**

- `v` Character vector.

---

.consolidate_varimps  

**Consolidate variable importances**

**Description**

Consolidation works in the following way:
1. if varimp variable is in x => add it to consolidated_varimps
2. for all remaining varimp variables:
   1. find the longest prefix of varimp variable that is in x and add it to the consolidated varimp
   2. if there was no match, throw an error
3. normalize the consolidated_varimps so they sum up to 1

**Usage**

```r
.consolidate_varimps(model)
```

**Arguments**

- `model` H2OModel

**Value**

sorted named vector
Description
Create a leaderboard like data frame for models

Usage
`.create_leaderboard(models_info, leaderboard_frame, top_n = 20)`

Arguments
- `models_info`: H2OAutoML object or list of models
- `leaderboard_frame`: when provided with list of models, use this frame to calculate metrics
- `top_n`: create leaderboard with just top_n models

Value
a data.frame

Description
A helper function that makes it easier to override/add params in a function call.

Usage
`.customized_call(fun, ..., overridable_defaults = NULL, overrides = NULL)`

Arguments
- `fun`: Function to be called
- `...`: Parameters that can’t be overridden
- `overridable_defaults`: List of parameters and values that can be overridden
- `overrides`: Parameters to add/override.

Value
result of fun
.find_appropriate_column_name

*Tries to match a fuzzy_col_name with a column name that exists in cols.*

**Description**

Tries to match a fuzzy_col_name with a column name that exists in cols.

**Usage**

```r
.find_appropriate_column_name(fuzzy_col_name, cols)
```

**Arguments**

- `fuzzy_col_name` a name to be decoded
- `cols` vector of columns that contain all possible column names, i.e., decode fuzzy_col_name must be in cols

**Value**

a correct column name

---

.get_algorithm

*Get the algorithm used by the model_or_model_id*

**Description**

Get the algorithm used by the model_or_model_id

**Usage**

```r
.get_algorithm(model_or_model_id, treat_xrt_as_algorithm = FALSE)
```

**Arguments**

- `model_or_model_id` Model object or a string containing model id
- `treat_xrt_as_algorithm` Try to find out if a model is XRT and if so report it as xrt

**Value**

algorithm name
**.get_feature_count**  
*Get feature count sorted by the count descending.*

**Description**  
Get feature count sorted by the count descending.

**Usage**  
```
.get_feature_count(column)
```

**Arguments**

- **column**  
  H2OFrame column

**Value**  
named vector with feature counts

---

**.get_first_of_family**  
*Get first of family models*

**Description**  
Get first of family models

**Usage**  
```
.get_first_of_family(models, all_stackedensembles = TRUE)
```

**Arguments**

- **models**  
  models or model ids
- **all_stackedensembles**  
  if TRUE, select all stacked ensembles
.h2o.doGET

Just like doRawGET but fills in the default h2oRestApiVersion if none is provided

Description

Just like doRawGET but fills in the default h2oRestApiVersion if none is provided

Usage

.h2o.doGET(h2oRestApiVersion, urlSuffix, parms, ...)

Arguments

  h2oRestApiVersion
    (Optional) A version number to prefix to the urlSuffix. If no version is provided, a default version is chosen for you.

  urlSuffix
    The partial URL suffix to add to the calculated base URL for the instance

  parms
    (Optional) Parameters to include in the request

  ...
    (Optional) Additional parameters.

Value

A list object as described above

.h2o.doPOST

Just like doRawPOST but fills in the default h2oRestApiVersion if none is provided

Description

Just like doRawPOST but fills in the default h2oRestApiVersion if none is provided

Usage

.h2o.doPOST(h2oRestApiVersion, urlSuffix, parms, ...)

Arguments

  h2oRestApiVersion
    (Optional) A version number to prefix to the urlSuffix. If no version is provided, a default version is chosen for you.

  urlSuffix
    The partial URL suffix to add to the calculated base URL for the instance

  parms
    (Optional) Parameters to include in the request

  ...
    (Optional) Additional parameters.
Value

A list object as described above

---

**Perform a low-level HTTP GET operation on an H2O instance**

Description

Does not do any I/O level error checking. Caller must do its own validations. Does not modify the response payload in any way. Log the request and response if h2o.startLogging() has been called.

Usage

```r
h2o.doRawGET(
  conn = h2o.getConnection(),
  h2oRestApiVersion,
  urlSuffix,
  parms,
  ...
)
```

Arguments

- **conn**
  - H2OConnection
- **h2oRestApiVersion**
  - (Optional) A version number to prefix to the urlSuffix. If no version is provided, the version prefix is skipped.
- **urlSuffix**
  - The partial URL suffix to add to the calculated base URL for the instance
- **parms**
  - (Optional) Parameters to include in the request
- **...**
  - (Optional) Additional parameters.

Details

The return value is a list as follows: $url – Final calculated URL. $postBody – The body of the POST request from client to server. $curlError – TRUE if a socket-level error occurred. FALSE otherwise. $curlErrorMessage – If curlError is TRUE a message about the error. $httpStatusCode – The HTTP status code. Usually 200 if the request succeeded. $httpStatusMessage – A string describing the httpStatusCode. $payload – The raw response payload as a character vector.

Value

A list object as described above
Perform a low-level HTTP POST operation on an H2O instance

Description

Does not do any I/O level error checking. Caller must do its own validations. Does not modify the response payload in any way. Log the request and response if h2o.startLogging() has been called.

Usage

```r
.h2o.doRawPOST(
  conn = h2o.getConnection(),
  h2oRestApiVersion,
  urlSuffix,
  parms,
  fileUploadInfo,
  ...
)
```

Arguments

- `conn` H2OConnection
- `h2oRestApiVersion` (Optional) A version number to prefix to the urlSuffix. If no version is provided, the version prefix is skipped.
- `urlSuffix` The partial URL suffix to add to the calculated base URL for the instance
- `parms` (Optional) Parameters to include in the request
- `fileUploadInfo` (Optional) Information to POST (NOTE: changes Content-type from XXX-www-url-encoded to multi-part). Use fileUpload(normalizePath("/path/to/file"))
- `...` (Optional) Additional parameters.

Details

The return value is a list as follows: $url – Final calculated URL. $postBody – The body of the POST request from client to server. $curlError – TRUE if a socket-level error occurred. FALSE otherwise. $curlErrorMessage – If curlError is TRUE a message about the error. $httpStatusCode – The HTTP status code. Usually 200 if the request succeeded. $httpStatusMessage – A string describing the httpStatusCode. $payload – The raw response payload as a character vector.

Value

A list object as described above
### .h2o.doSafeGET

**Perform a safe (i.e. error-checked) HTTP GET request to an H2O cluster.**

**Description**

This function validates that no CURL error occurred and that the HTTP response code is successful. If a failure occurred, then stop() is called with an error message. Since all necessary error checking is done inside this call, the valid payload is directly returned if the function successfully finishes without calling stop().

**Usage**

`.h2o.doSafeGET(h2oRestApiVersion, urlSuffix, parms, ...)`

**Arguments**

- **h2oRestApiVersion**
  
  (Optional) A version number to prefix to the urlSuffix. If no version is provided, a default version is chosen for you.

- **urlSuffix**
  
  The partial URL suffix to add to the calculated base URL for the instance

- **parms**
  
  (Optional) Parameters to include in the request

- **...**
  
  (Optional) Additional parameters.

**Value**

The raw response payload as a character vector

### .h2o.doSafePOST

**Perform a safe (i.e. error-checked) HTTP POST request to an H2O cluster.**

**Description**

This function validates that no CURL error occurred and that the HTTP response code is successful. If a failure occurred, then stop() is called with an error message. Since all necessary error checking is done inside this call, the valid payload is directly returned if the function successfully finishes without calling stop().

**Usage**

`.h2o.doSafePOST(h2oRestApiVersion, urlSuffix, parms, fileUploadInfo, ...)`
Arguments

- **h2oRestApiVersion**
  (Optional) A version number to prefix to the urlSuffix. If no version is provided, a default version is chosen for you.
- **urlSuffix**
  The partial URL suffix to add to the calculated base URL for the instance
- **parms**
  (Optional) Parameters to include in the request
- **fileUploadInfo**
  (Optional) Information to POST (NOTE: changes Content-type from XXX-www-url-encoded to multi-part). Use fileUpload(normalizePath("/path/to/file")).
- **...**
  (Optional) Additional parameters.

Value

The raw response payload as a character vector

---

`.h2o.is_progress`  
*Check if Progress Bar is Enabled*

**Description**

Check if Progress Bar is Enabled

**Usage**

`.h2o.is_progress()`

---

`.h2o.locate`  
*Locate a file given the pattern <bucket>/<path/to/file> e.g. h2o:::.h2o.locate("smalldata/iris/iris22.csv") returns the absolute path to iris22.csv*

**Description**

Locate a file given the pattern <bucket>/<path/to/file> e.g. h2o:::.h2o.locate("smalldata/iris/iris22.csv") returns the absolute path to iris22.csv

**Usage**

`.h2o.locate(pathStub, root.parent = NULL)`

**Arguments**

- **pathStub**  relative path
- **root.parent**  search root directory
.h2o.perfect_auc

Internal function that calculates a precise AUC from given probabilities and actual responses.

Description
Note: The underlying implementation is not distributed and can only handle limited size of data. For internal use only.

Usage
.h2o.perfect_auc(probs, acts)

Arguments
probs An H2OFrame holding vector of probabilities.
acts An H2OFrame holding vector of actuals.

.h2o.primitives
Map of operations known to H2O

Description
Map of operations known to H2O

Usage
.h2o.primitives

Format
An object of class character of length 39.
.h2o.__ALL_CAPABILITIES

Capabilities endpoints

Description
Capabilities endpoints

Usage
.h2o.__ALL_CAPABILITIES

Format
An object of class character of length 1.

.h2o.__checkConnectionHealth

Check H2O Server Health

Description
Warn if there are sick nodes.

Usage
.h2o.__checkConnectionHealth()

.h2o.__CREATE_FRAME

H2OFrame Manipulation

Description
H2OFrame Manipulation

Usage
.h2o.__CREATE_FRAME

Format
An object of class character of length 1.
Decryption Endpoints

Description
Decryption Endpoints

Usage
.h2o.__DECRIPTION_SETUP

Format
An object of class character of length 1.

Removal Endpoints

Description
Removal Endpoints

Usage
.h2o.__DKV

Format
An object of class character of length 1.

Export Files Endpoint Generator

Description
Export Files Endpoint Generator

Usage
.h2o.__EXPORT_FILES(frame)

Arguments
frame H2OFrame
.h2o.__FRAMES

**Inspect/Summary Endpoints**

**Description**

Inspect/Summary Endpoints

**Usage**

.h2o.__FRAMES

**Format**

An object of class character of length 1.

---

.h2o.__IMPORT

**Import/Export Endpoints**

**Description**

Import/Export Endpoints

**Usage**

.h2o.__IMPORT

**Format**

An object of class character of length 1.

---

.h2o.__JOBS

**Administrative Endpoints**

**Description**

Administrative Endpoints

**Usage**

.h2o.__JOBS

**Format**

An object of class character of length 1.
Log and Echo Endpoint

Description
Log and Echo Endpoint

Usage
.h2o.__LOGANDECHO

Format
An object of class character of length 1.

Model Endpoint

Description
Model Endpoint

Usage
.h2o.__MODELS

Format
An object of class character of length 1.

Model Builder Endpoint Generator

Description
Model Builder Endpoint Generator

Usage
.h2o.__MODEL_BUIDERS(algo)

Arguments
algo Cannonical identifier of H2O algorithm.
**Model Metrics Endpoint**

**Description**

Model Metrics Endpoint

**Usage**

```
.h2o.__MODEL_METRICS(model, data)
```

**Arguments**

- `model` H2OModel.
- `data` H2OFrame.

---

**Parse Endpoints**

**Description**

Parse Endpoints

**Usage**

```
.h2o.__PARSE_SETUP
```

**Format**

An object of class character of length 1.

---

**Rapids Endpoint**

**Description**

Rapids Endpoint

**Usage**

```
.h2o.__RAPIDS
```

**Format**

An object of class character of length 1.
H2O Package Constants

Description

The API endpoints for interacting with H2O via REST are named here.

Usage

.h2o.__REST_API_VERSION

Format

An object of class integer of length 1.

Details

Additionally, environment variables for the H2O package are named here. Endpoint Version

Segment Models Builder Endpoint Generator

Description

Segment Models Builder Endpoint Generator

Usage

.h2o.__SEGMENT_MODELS_BUILDERS(algo)

Arguments

algo        Canonical identifier of H2O algorithm.
### Word2Vec Endpoints

**Description**

Word2Vec Endpoints

**Usage**

```r
.h2o.__W2V_SYNONYMS
```

**Format**

An object of class `character` of length 1.

### .has_varimp

**Description**

Has the model variable importance?

**Usage**

```r
.has_varimp(model)
```

**Arguments**

- `model` model or a string containing model id

**Value**

`boolean`
.interpretable

Is the model considered to be interpretable, i.e., simple enough.

Description
Is the model considered to be interpretable, i.e., simple enough.

Usage
.interpretable(model)

Arguments
model model or a string containing model id

Value
boolean

.is_h2o_model
Is the model an H2O model?

Description
Is the model an H2O model?

Usage
.is_h2o_model(model)

Arguments
model Either H2O model/model id => TRUE, or something else => FALSE

Value
boolean
.is_h2o_tree_model | Is the model a Tree-based H2O Model?

Description
Is the model a Tree-based H2O Model?

Usage
.is_h2o_tree_model(model)

Arguments
model | Either tree-based H2O model/model id => TRUE, or something else => FALSE

Value
boolean

.is_plotting_to_rnotebook
Check if we are plotting in to r notebook.

Description
Check if we are plotting in to r notebook.

Usage
.is_plotting_to_rnotebook()

Value
boolean
Enhance leaderboard with per-model predictions.

**Usage**

```
.leaderboard_for_row(models_info, newdata, row_index, top_n = 20)
```

**Arguments**

- `models_info` models_info object
- `newdata` H2OFrame
- `row_index` index of the inspected row
- `top_n` leaderboard will contain top_n models

**Value**

H2OFrame

Min-max normalization.

**Usage**

```
.min_max(col)
```

**Arguments**

- `col` numeric vector

**Value**

normalized numeric vector
.model_ids

Description

When provided with list of models it will extract model ids. When provided with model ids it won’t change anything. Works for mixed list as well.

Usage

.model_ids(models)

Arguments

models list or vector of models/model_ids

Value

a vector of model_ids

.pkg.env

The H2O Package Environment

Description

The H2O Package Environment

Usage

.pkg.env

Format

An object of class environment of length 4.
.plot_varimp

Plot variable importances with ggplot2

Description

Plot variable importances with ggplot2

Usage

.plot_varimp(model, top_n = 10)

Arguments

  model       H2OModel
  top_n       Plot just top_n features

Value

  list of variable importance, grouped variable importance, and variable importance plot

.process_models_or_automl

Do basic validation and transform object to a "standardized" list containing models, and their properties such as x, y, whether it is a (multinomial) classification or not etc.

Description

Do basic validation and transform object to a "standardized" list containing models, and their properties such as x, y, whether it is a (multinomial) classification or not etc.

Usage

.process_models_or_automl(
  object,
  newdata,
  require_single_model = FALSE,
  require_multiple_models = FALSE,
  top_n_from_AutoML = NA,
  only_with_varimp = FALSE,
  best_of_family = FALSE,
  require_newdata = TRUE
)

Arguments

- **object**: Can be a single model/model_id, vector of model_id, list of models, H2OAutoML object
- **newdata**: An H2OFrame with the same format as training frame
- **require_single_model**: If true, make sure we were provided only one model
- **require_multiple_models**: If true, make sure we were provided at least two models
- **top_n_from_AutoML**: If set, don’t return more than top_n models (applies only for AutoML object)
- **only_with_varimp**: If TRUE, return only models that have variable importance
- **best_of_family**: If TRUE, return only the best of family models; if FALSE return all models in object
- **require_newdata**: If TRUE, require newdata to be specified; otherwise allow NULL instead, this can be used when there is no need to know if the problem is (multinomial) classification.

Value

a list with the following names `leader`, `is_automl`, `models`, `is_classification`, `is_multinomial_classification`, `x`, `y`, `model`.

---

**.shorten_model_ids**

Shortens model ids if possible (iff there will be same amount of unique model_ids as before)

Description

Shortens model ids if possible (iff there will be same amount of unique model_ids as before)

Usage

`.shorten_model_ids(model_ids)`

Arguments

- **model_ids**: character vector

Value

character vector
Description

Collected here are the various methods used by the h2o-R package to communicate with the H2O backend. There are methods for checking cluster health, polling, and inspecting objects in the H2O store.

Usage

```r
.skip_if_not_developer()
```

Description

Convert to quantiles when provided with numeric vector. When `col` is a factor vector assign uniformly value between 0 and 1 to each level.

Usage

```r
.uniformize(col)
```

Arguments

- `col` vector

Value

vector with values between 0 and 1
### .varimp

*Get variable importance in a standardized way.*

**Description**

Get variable importance in a standardized way.

**Usage**

```
.varimp(model)
```

**Arguments**

- `model` H2OModel

**Value**

A named vector

### .verify_dataxy

*Used to verify data, x, y and turn into the appropriate things*

**Description**

Used to verify data, x, y and turn into the appropriate things.

**Usage**

```
.verify_dataxy(data, x, y, autoencoder = FALSE)
```

**Arguments**

- `data` H2OFrame
- `x` features
- `y` response
- `autoencoder` autoencoder flag
Description

Starting H2O For examples

Examples

```r
## Not run:
if (Sys.info()["sysname"] == "Darwin" && Sys.info()["release"] == "13.4.0") {
  quit(save = "no")
} else {
  h2o.init(nthreads = 2)
}
## End(Not run)
```

apply

Apply on H2O Datasets

Description

Method for apply on H2OFrame objects.

Usage

```r
apply(X, MARGIN, FUN, ...)
```

Arguments

- `X` an H2OFrame object on which apply will operate.
- `MARGIN` the vector on which the function will be applied over, either 1 for rows or 2 for columns.
- `FUN` the function to be applied.
- `...` optional arguments to `FUN`.

Value

Produces a new H2OFrame of the output of the applied function. The output is stored in H2O so that it can be used in subsequent H2O processes.

See Also

- `apply` for the base generic
as.character.H2OFrame  Convert an H2OFrame to a String

Description

Convert an H2OFrame to a String

Usage

## S3 method for class 'H2OFrame'
as.character(x, ...)

Arguments

x          An H2OFrame object
...

Further arguments to be passed from or to other methods.

Examples

## Not run:
library(h2o)
h2o.init()
pretrained <- as.h2o(data.frame(
  C1 = c("a", "b"), C2 = c(0, 1), C3 = c(1, 0), C4 = c(0.2, 0.8),
  stringsAsFactors = FALSE))
pretrained_w2v <- h2o.word2vec(pre_trained = pretrained, vec_size = 3)
words <- as.character(as.h2o(c("b", "a", "c", NA, "a")))
vecs <- h2o.transform(pretrained_w2v, words = words)

## End(Not run)
as.data.frame.H2OFrame

Converts parsed H2O data into an R data frame

Description

Downloads the H2O data and then scans it in to an R data frame.

Usage

```r
## S3 method for class 'H2OFrame'
as.data.frame(x, ...)
```

Arguments

- `x` An H2OFrame object.
- `...` Further arguments to be passed down from other methods.

Details

Method `as.data.frame.H2OFrame` will use `fread` if data.table package is installed in required version.

See Also

`use.package`

Examples

```r
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
as.data.frame(prostate)

## End(Not run)
```
as.data.frame.H2OSegmentModels

Converts a collection of Segment Models to a data.frame

Description

Converts a collection of Segment Models to a data.frame

Usage

## S3 method for class 'H2OSegmentModels'
as.data.frame(x, ...)

Arguments

x
Object of class H2OSegmentModels.

... Further arguments to be passed down from other methods.

Value

Returns data.frame with result of segment model training.

Examples

## Not run:
library(h2o)
h2o.init()
iris_hf <- as.h2o(iris)
models <- h2o.train_segments(algorithm = "gbm",
                           segment_columns = "Species",
                           x = c(1:3), y = 4,
                           training_frame = iris_hf,
                           ntrees = 5,
                           max_depth = 4)
as.data.frame(models)

## End(Not run)

as.factor

Convert H2O Data to Factors

Description

Convert a column into a factor column.
as.h2o

Usage

as.factor(x)

Arguments

x a column from an H2OFrame data set.

See Also

as.factor.

Examples

## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
prostate[, 2] <- as.factor(prostate[, 2])
summary(prostate)

## End(Not run)

Create H2OFrame

Import R object to the H2O cluster.

Usage

as.h2o(x, destination_frame = "", ...)  

## Default S3 method:
as.h2o(x, destination_frame = "", ...)  

## S3 method for class 'H2OFrame'
as.h2o(x, destination_frame = "", ...)  

## S3 method for class 'data.frame'
as.h2o(x, destination_frame = "", use_datatable = TRUE, ...)  

## S3 method for class 'Matrix'
as.h2o(x, destination_frame = "", use_datatable = TRUE, ...)
Arguments

- **x** 
  An R object.

- **destination_frame**
  A string with the desired name for the H2OFrame

- **...**
  Arguments passed to method arguments.

- **use_datatable**
  Allow usage of data.table

Details

Method `as.h2o.data.frame` will use `fwrite` if the data.table package is installed in required version. To speed up execution time for large sparse matrices, use `h2o datatable`. Make sure you have installed and imported `data.table` and `slam` packages. Turn on `h2o datatable` by options(`"h2o.use.data.table"`=TRUE)

Examples

```r
## Not run:
library(h2o)

h2o.init()
iris_hf <- as.h2o(iris)
euro_hf <- as.h2o(euro)
letters_hf <- as.h2o(letters)
state_hf <- as.h2o(state.x77)
iris_hf_2 <- as.h2o(iris_hf)

stopifnot(is.h2o(iris_hf), dim(iris_hf) == dim(iris),
          is.h2o(euro_hf), dim(euro_hf) == c(length(euro), 1L),
          is.h2o(letters_hf), dim(letters_hf) == c(length(letters), 1L),
          is.h2o(state_hf), dim(state_hf) == dim(state.x77),
          is.h2o(iris_hf_2), dim(iris_hf_2) == dim(iris_hf))

if (requireNamespace("Matrix", quietly=TRUE)) {
  data <- rep(0, 100)
data[(1:10) ^ 2] <- 1:10 * pi
m <- matrix(data, ncol = 20, byrow = TRUE)
m <- Matrix::Matrix(m, sparse = TRUE)
m_hf <- as.h2o(m)

stopifnot(is.h2o(m_hf), dim(m_hf) == dim(m))
}

## End(Not run)
```
**as.matrix.H2OFrame**  
*Convert an H2OFrame to a matrix*

**Description**

Convert an H2OFrame to a matrix

**Usage**

```r
## S3 method for class 'H2OFrame'
as.matrix(x, ...)
```

**Arguments**

- `x`  
  An H2OFrame object
- `...`  
  Further arguments to be passed down from other methods.

**Examples**

```r
## Not run:
library(h2o)
h2o.init()
iris_hf <- as.h2o(iris)
describe <- h2o.describe(iris_hf)
mins = as.matrix(apply(iris_hf, 2, min))
print(mins)
## End(Not run)
```

---

**as.numeric**  
*Convert H2O Data to Numeric*

**Description**

Converts an H2O column into a numeric value column.

**Usage**

```r
as.numeric(x)
```

**Arguments**

- `x`  
  a column from an H2OFrame data set.
as.vector.H2OFrame

Convert an H2OFrame to a vector

Description

Convert an H2OFrame to a vector

Usage

```r
## S3 method for class 'H2OFrame'
as.vector(x, mode)
```

Arguments

- `x`: An H2OFrame object
- `mode`: Mode to coerce vector to

Examples

```r
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
prostate[, 2] <- as.factor(prostate[, 2])
prostate[, 2] <- as.numeric(prostate[, 2])

## End(Not run)
```

```r
## Not run:
library(h2o)
h2o.init()
iris_hf <- as.h2o(iris)
cor_R <- cor(as.matrix(iris[, 1]))
cor_h2o <- cor(iris_hf[, 1])
iris_R_cor <- cor(iris[, 1:4])
iris_H2O_cor <- as.data.frame(cor(iris_hf[, 1:4]))
h2o_vec <- as.vector(unlist(iris_H2O_cor))
r_vec <- as.vector(unlist(iris_R_cor))

## End(Not run)
```
Australia Coastal Data

Description

Temperature, soil moisture, runoff, and other environmental measurements from the Australia coast. The data is available from https://cs.colby.edu/courses/S11/cs251/labs/lab07/AustraliaSubset.csv.

Format

A data frame with 251 rows and 8 columns

colnames

Returns the column names of an H2OFrame

Description

Returns the column names of an H2OFrame

Usage

colnames(x, do.NULL = TRUE, prefix = "col")

Arguments

x An H2OFrame object.
do.NULL logical. If FALSE and names are NULL, names are created.
prefix for created names.

Examples

## Not run:
library(h2o)
h2o.init()

iris_hf <- as.h2o(iris)
colnames(iris_hf) # Returns "Sepal.Length" "Sepal.Width" "Petal.Length" "Petal.Width" "Species"

## End(Not run)
dim.H2OFrame  

Returns the Dimensions of an H2OFrame

Description

Returns the number of rows and columns for an H2OFrame object.

Usage

```r
## S3 method for class 'H2OFrame'
dim(x)
```

Arguments

- `x`  
  An H2OFrame object.

See Also

- `dim` for the base R method.

Examples

```r
## Not run:
library(h2o)
h2o.init()

iris_hf <- as.h2o(iris)
dim(iris_hf)
```

---

dimnames.H2OFrame  

Column names of an H2OFrame

Description

Set column names of an H2O Frame

Usage

```r
## S3 method for class 'H2OFrame'
dimnames(x)
```

Arguments

- `x`  
  An H2OFrame
Examples

```r
## Not run:
library(h2o)
h2o.init()

n <- 2000
# Generate variables V1, ... V10
X <- matrix(rnorm(10 * n), n, 10)
# y = +1 if sum_i x_{ij}^2 > chisq median on 10 df
y <- rep(-1, n)
y[apply(X*X, 1, sum) > qchisq(.5, 10)] <- 1
# Assign names to the columns of X:
dimnames(X)[[2]] <- c("V1", "V2", "V3", "V4", "V5", "V6", "V7", "V8", "V9", "V10")

## End(Not run)
```

---

**feature_frequencies.H2OModel**

Retrieve the number of occurrences of each feature for given observations Available for GBM, Random Forest and Isolation Forest models.

---

**Description**

Retrieve the number of occurrences of each feature for given observations Available for GBM, Random Forest and Isolation Forest models.

**Usage**

```r
feature_frequencies.H2OModel(object, newdata, ...)
```

```r
h2o.feature_frequencies(object, newdata, ...)
```

**Arguments**

- `object` a fitted H2OModel object for which prediction is desired
- `newdata` An H2OFrame object in which to look for variables with which to predict.
- `...` additional arguments to pass on.

**Value**

Returns an H2OFrame contain per-feature frequencies on the predict path for each input row.

**See Also**

- `h2o.gbm` and `h2o.randomForest` for model generation in h2o.
generate_col_ind

Check to see if the column names/indices entered is valid for the dataframe given. This is an internal function.

**Description**

Check to see if the column names/indices entered is valid for the dataframe given. This is an internal function.

**Usage**

`generate_col_ind(data, by)`

**Arguments**

- `data` : The H2OFrame whose column names or indices are entered as a list.
- `by` : The column names/indices in a list.

---

get_seed.H2OModel

Get the seed from H2OModel which was used during training. If a user does not set the seed parameter before training, the seed is auto-generated. It returns seed as the string if the value is bigger than the integer. For example, an autogenerated seed is always long so that the seed in R is a string.

**Description**

Get the seed from H2OModel which was used during training. If a user does not set the seed parameter before training, the seed is auto-generated. It returns seed as the string if the value is bigger than the integer. For example, an autogenerated seed is always long so that the seed in R is a string.

**Usage**

`get_seed.H2OModel(object)`

`h2o.get_seed(object)`

**Arguments**

- `object` : a fitted H2OModel object.

**Value**

Returns seed to be used during training a model. Could be numeric or string.
Compute the absolute value of x

Description
Compute the absolute value of x

Usage
h2o.abs(x)

Arguments
x An H2OFrame object.

See Also
MathFun for the base R implementation, abs().

Examples
## Not run:
library(h2o)
h2o.init()
smtrees_hf <- h2o.importFile(url)
model <- h2o.gbm(x = c("girth", "height"), y = "vol", ntree = 3, max_depth = 1,
                 distribution = "gaussian", min_rows = 2, learn_rate = .1,
                 training_frame = smtrees_hf)
pred <- as.data.frame(predict(model, newdata = smtrees_hf))
diff.abs <- abs(diff)
print(diff.abs)
## End(Not run)
h2o.acos

*Compute the arc cosine of x*

**Description**

Compute the arc cosine of x

**Usage**

h2o.acos(x)

**Arguments**

- **x**
  
  An H2OFrame object.

**See Also**

[Trig](#) for the base R implementation, acos().

**Examples**

```r
def not run:
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
h2o.acos(prostate[, 2])
```

```
## End(Not run)
```

---

h2o.aggregated_frame

*Retrieve an aggregated frame from an Aggregator model*

**Description**

Retrieve an aggregated frame from the Aggregator model and use it to create a new frame.

**Usage**

h2o.aggregated_frame(model)

**Arguments**

- **model**
  
  an H2OClusteringModel corresponding from a h2o.aggregator call.
Examples

```r
## Not run:
library(h2o)
h2o.init()
df <- h2o.createFrame(rows = 100,
cols = 5,
categorical_fraction = 0.6,
integer_fraction = 0,
binary_fraction = 0,
real_range = 100,
integer_range = 100,
missing_fraction = 0)

target_num_exemplars = 1000
rel_tol_num_exemplars = 0.5
encoding = "Eigen"
agg <- h2o.aggregator(training_frame = df,
target_num_exemplars = target_num_exemplars,
rel_tol_num_exemplars = rel_tol_num_exemplars,
categorical_encoding = encoding)
# Use the aggregated frame to create a new dataframe
new_df <- h2o.aggregated_frame(agg)

## End(Not run)
```

---

**h2o.aggregator**

Build an Aggregated Frame

**Description**

Builds an Aggregated Frame of an H2OFrame.

**Usage**

```r
h2o.aggregator(
  training_frame,
  x,
  model_id = NULL,
  ignore_const_cols = TRUE,
  target_num_exemplars = 5000,
  rel_tol_num_exemplars = 0.5,
  transform = c("NONE", "STANDARDIZE", "NORMALIZE", "DEMEAN", "DESCALE"),
  categorical_encoding = c("AUTO", "Enum", "OneHotInternal", "OneHotExplicit",
                          "Binary", "Eigen", "LabelEncoder", "SortByResponse", "EnumLimited"),
  save_mapping_frame = FALSE,
  num_iteration_without_new_exemplar = 500,
  export_checkpoints_dir = NULL
)
```
Arguments

- training_frame  Id of the training data frame.
- x  A vector containing the character names of the predictors in the model.
- model_id  Destination id for this model; auto-generated if not specified.
- ignore_const_cols  Logical. Ignore constant columns. Defaults to TRUE.
- target_num_exemplars  Targeted number of exemplars. Defaults to 5000.
- rel_tol_num_exemplars  Relative tolerance for number of exemplars (e.g., 0.5 is +/- 50 percent). Defaults to 0.5.
- transform  Transformation of training data. Must be one of: "NONE", "STANDARDIZE", "NORMALIZE", "DEMEAN", "DESCALE". Defaults to NORMALIZE.
- categorical_encoding  Encoding scheme for categorical features. Must be one of: "AUTO", "Enum", "OneHotInternal", "OneHotExplicit", "Binary", "Eigen", "LabelEncoder", "Sort-ByResponse", "EnumLimited". Defaults to AUTO.
- save_mapping_frame  Logical. Whether to export the mapping of the aggregated frame. Defaults to FALSE.
- num_iteration_without_new_exemplar  The number of iterations to run before aggregator exits if the number of exemplars collected didn’t change. Defaults to 500.
- export_checkpoints_dir  Automatically export generated models to this directory.

Examples

```r
## Not run:
library(h2o)
h2o.init()
df <- h2o.createFrame(rows = 100,
  cols = 5,
  categorical_fraction = 0.6,
  integer_fraction = 0,
  binary_fraction = 0,
  real_range = 100,
  integer_range = 100,
  missing_fraction = 0)

target_num_exemplars = 1000
rel_tol_num_exemplars = 0.5
encoding = "Eigen"
agg <- h2o.aggregator(training_frame = df,
  target_num_exemplars = target_num_exemplars,
  rel_tol_num_exemplars = rel_tol_num_exemplars,
  categorical_encoding = encoding)

## End(Not run)
```
h2o.aic

Retrieve the Akaike information criterion (AIC) value

Description

Retrieves the AIC value. If "train", "valid", and "xval" parameters are FALSE (default), then the training AIC value is returned. If more than one parameter is set to TRUE, then a named vector of AICs are returned, where the names are "train", "valid" or "xval".

Usage

h2o.aic(object, train = FALSE, valid = FALSE, xval = FALSE)

Arguments

- object: An H2OModel or H2OModelMetrics.
- train: Retrieve the training AIC
- valid: Retrieve the validation AIC
- xval: Retrieve the cross-validation AIC

Examples

## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
p_sid <- h2o.runif(prostate)
prostate_train <- prostate[p_sid > .2,]
prostate_glm <- h2o.glm(x = 3:7, y = 2, training_frame = prostate_train)
aic_basic <- h2o.aic(prostate_glm)
print(aic_basic)

## End(Not run)

h2o.all

Given a set of logical vectors, are all of the values true?

Description

Given a set of logical vectors, are all of the values true?

Usage

h2o.all(x)
Arguments

x An H2OFrame object.

See Also

call for the base R implementation.

Description

Detect anomalies in an H2O dataset using an H2O deep learning model with auto-encoding.

Usage

h2o.anomaly(object, data, per_feature = FALSE)

Arguments

object An H2OAutoEncoderModel object that represents the model to be used for anomaly detection.
data An H2OFrame object.
per_feature Whether to return the per-feature squared reconstruction error

Value

Returns an H2OFrame object containing the reconstruction MSE or the per-feature squared error.

See Also

call for making an H2OAutoEncoderModel.

Examples

## Not run:
library(h2o)
h2o.init()
prostate_path = system.file("extdata", "prostate.csv", package = "h2o")
prostate = h2o.importFile(path = prostate_path)
prostate_dl = h2o.deeplearning(x = 3:9, training_frame = prostate, autoencoder = TRUE,
hidden = c(10, 10), epochs = 5)
prostate_anon = h2o.anomaly(prostate_dl, prostate)
head(prostate_anon)
head(prostate_anon_per_feature)

## End(Not run)
h2o.any

Given a set of logical vectors, is at least one of the values true?

Description
Given a set of logical vectors, is at least one of the values true?

Usage
h2o.any(x)

Arguments
x   An H2OFrame object.

See Also
all for the base R implementation.

Examples
## Not run:
library(h2o)
h2o.init()

iris <- h2o.importFile(f)
h2o.any(iris[, 1] < 1000)
## End(Not run)

h2o.anyFactor
Check H2OFrame columns for factors

Description
Determines if any column of an H2OFrame object contains categorical data.

Usage
h2o.anyFactor(x)

Arguments
x   An H2OFrame object.
h2o.arrange

Value

Returns a logical value indicating whether any of the columns in \( x \) are factors.

Examples

```
## Not run:
library(h2o)
h2o.init()
iris_hf <- as.h2o(iris)
h2o.anyFactor(iris_hf)

## End(Not run)
```

h2o.arrange  Sorts an H2O frame by columns

Description

Sorts H2OFrame by the columns specified. H2OFrame can contain String columns but should not sort on any String columns. Otherwise, an error will be thrown. To sort column \( c1 \) in descending order, do \( \text{desc}(c1) \). Returns a new H2OFrame, like \text{dplyr::arrange}.

Usage

h2o.arrange(x, ...)

Arguments

- \( x \) The H2OFrame input to be sorted.
- \( ... \) The column names to sort by.

Examples

```
## Not run:
library(h2o)
h2o.init()

iris <- h2o.importFile(f)
h2o.arrange(iris, "species","petal_len","petal_wid")

## End(Not run)
```
h2o.ascharacter

Convert H2O Data to Characters

Description
Convert H2O Data to Characters

Usage
h2o.ascharacter(x)

Arguments
x    An H2OFrame object.

Examples
## Not run:
library(h2o)
h2o.init()

iris <- h2o.importFile(f)
h2o.ascharacter(iris["species"])

## End(Not run)

h2o.asfactor

Convert H2O Data to Factors

Description
Convert H2O Data to Factors

Usage
h2o.asfactor(x)

Arguments
x    An H2OFrame object.

See Also
factor for the base R implementation, as.factor().
Examples

```r
## Not run:
library(h2o)
h2o.init()

cars <- h2o.importFile(f)
h2o.asfactor(cars["cylinders"])

## End(Not run)
```

---

**h2o.asnumeric**

Convert H2O Data to Numerics

Description

Convert H2O Data to Numerics

Usage

```r
h2o.asnumeric(x)
```

Arguments

- `x` - An H2OFrame object.

See Also

`numeric` for the base R implementation, `as.numeric()`.

Examples

```r
## Not run:
library(h2o)
h2o.init()

cars <- h2o.importFile(f)
h2o.asnumeric(cars)

## End(Not run)
```
rename an H2O object.

Description

Makes a copy of the data frame and gives it the desired key.

Usage

h2o.assign(data, key)

Arguments

- **data**: An H2OFrame object
- **key**: The key to be associated with the H2O parsed data object

Examples

```r
## Not run:
library(h2o)
h2o.init()

cars <- h2o.importFile(f)
dim(cars)
split <- h2o.splitFrame(data = cars, ratios = 0.8)
train <- h2o.assign(split[[1]], key = "train")
test <- h2o.assign(split[[2]], key = "test")
dim(train)
dim(test)

## End(Not run)
```

convert between character representations and objects of Date class.

Description

Functions to convert between character representations and objects of class "Date" representing calendar dates.

Usage

h2o.as_date(x, format, ...)
Arguments

- **x**: H2OFrame column of strings or factors to be converted
- **format**: A character string indicating date pattern
- **...**: Further arguments to be passed from or to other methods.

---

**h2o.auc**

Retrieve the AUC

Description

Retrieves the AUC value from an H2OBinomialMetrics. If "train", "valid", and "xval" parameters are FALSE (default), then the training AUC value is returned. If more than one parameter is set to TRUE, then a named vector of AUCs are returned, where the names are "train", "valid" or "xval".

Usage

h2o.auc(object, train = FALSE, valid = FALSE, xval = FALSE)

Arguments

- **object**: An H2OBinomialMetrics or H2OMultinomialMetrics object.
- **train**: Retrieve the training AUC
- **valid**: Retrieve the validation AUC
- **xval**: Retrieve the cross-validation AUC

See Also

- **h2o.giniCoef** for the Gini coefficient, **h2o.mse** for MSE, and **h2o.metric** for the various threshold metrics. See **h2o.performance** for creating H2OModelMetrics objects.

Examples

```r
# Not run:
library(h2o)
h2o.init()

prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(prostate_path)
prostate[, 2] <- as.factor(prostate[, 2])
model <- h2o.gbm(x = 3:9, y = 2, training_frame = prostate, distribution = "bernoulli")
perf <- h2o.performance(model, prostate)
h2o.auc(perf)
```

## End(Not run)
h2o.aucpr

Retrieve the AUCPR (Area Under Precision Recall Curve)

Description

Retrieves the AUCPR value from an H2OBinomialMetrics. If "train", "valid", and "xval" parameters are FALSE (default), then the training AUCPR value is returned. If more than one parameter is set to TRUE, then a named vector of AUCPRs are returned, where the names are "train", "valid" or "xval".

Usage

h2o.aucpr(object, train = FALSE, valid = FALSE, xval = FALSE)

Arguments

object  An H2OBinomialMetrics object.
train   Retrieve the training aucpr
valid   Retrieve the validation aucpr
xval    Retrieve the cross-validation aucpr

See Also

h2o.giniCoef for the Gini coefficient, h2o.mse for MSE, and h2o.metric for the various threshold metrics. See h2o.performance for creating H2OModelMetrics objects.

Examples

## Not run:
library(h2o)
h2o.init()

prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(prostate_path)

prostate[, 2] <- as.factor(prostate[, 2])
model <- h2o.gbm(x = 3:9, y = 2, training_frame = prostate, distribution = "bernoulli")
perf <- h2o.performance(model, prostate)
h2o.aucpr(perf)

## End(Not run)
Description

The Automatic Machine Learning (AutoML) function automates the supervised machine learning model training process. The current version of AutoML trains and cross-validates the following algorithms (in the following order): three pre-specified XGBoost GBM (Gradient Boosting Machine) models, a fixed grid of GLMs, a default Random Forest (DRF), five pre-specified H2O GBMs, a near-default Deep Neural Net, an Extremely Randomized Forest (XRT), a random grid of XGBoost GBMs, a random grid of H2O GBMs, and a random grid of Deep Neural Nets. In some cases, there will not be enough time to complete all the algorithms, so some may be missing from the leaderboard. AutoML then trains two Stacked Ensemble models, one of all the models, and one of only the best models of each kind.

Usage

```
h2o.automl(
  x,
  y,
  training_frame,
  validation_frame = NULL,
  leaderboard_frame = NULL,
  blending_frame = NULL,
  nfolds = 5,
  fold_column = NULL,
  weights_column = NULL,
  balance_classes = FALSE,
  class_sampling_factors = NULL,
  max_after_balance_size = 5,
  max_runtime_secs = NULL,
  max_runtime_secs_per_model = NULL,
  max_models = NULL,
  stopping_metric = c("AUTO", "deviance", "logloss", "MSE", "RMSE", "MAE", "RMSLE", "AUC", "AUCPR", "lift_top_group", "misclassification", "mean_per_class_error"),
  stopping_tolerance = NULL,
  stopping_rounds = 3,
  seed = NULL,
  project_name = NULL,
  exclude_algos = NULL,
  include_algos = NULL,
  modeling_plan = NULL,
  preprocessing = NULL,
  exploitation_ratio = 0,
  monotone_constraints = NULL,
  keep_cross_validation_predictions = FALSE,
  keep_cross_validation_models = FALSE,
)```
Arguments

x  A vector containing the names or indices of the predictor variables to use in building the model. If x is missing, then all columns except y are used.

y  The name or index of the response variable in the model. For classification, the y column must be a factor, otherwise regression will be performed. Indexes are 1-based in R.

training_frame  Training frame (H2OFrame or ID).

validation_frame  Validation frame (H2OFrame or ID); Optional. This argument is ignored unless the user sets nfolds = 0. If cross-validation is turned off, then a validation frame can be specified and used for early stopping of individual models and early stopping of the grid searches. By default and when nfolds > 1, cross-validation metrics will be used for early stopping and thus validation_frame will be ignored.

leaderboard_frame  Leaderboard frame (H2OFrame or ID); Optional. If provided, the Leaderboard will be scored using this data frame instead of using cross-validation metrics, which is the default.

blending_frame  Blending frame (H2OFrame or ID) used to train the metalearning algorithm in Stacked Ensembles (instead of relying on cross-validated predicted values); Optional. When provided, it also is recommended to disable cross validation by setting 'nfolds=0' and to provide a leaderboard frame for scoring purposes.

nfolds  Number of folds for k-fold cross-validation. Defaults to 5. Use 0 to disable cross-validation; this will also disable Stacked Ensemble (thus decreasing the overall model performance).

column  Column with cross-validation fold index assignment per observation; used to override the default, randomized, 5-fold cross-validation scheme for individual models in the AutoML run.

weights_column  Column with observation weights. Giving some observation a weight of zero is equivalent to excluding it from the dataset; giving an observation a relative weight of 2 is equivalent to repeating that row twice. Negative weights are not allowed.

balance_classes  Logical. Balance training data class counts via over/under-sampling (for imbalanced data). Defaults to FALSE.

class_sampling_factors  Desired over/under-sampling ratios per class (in lexicographic order). If not specified, sampling factors will be automatically computed to obtain class balance during training. Requires balance_classes.
max_after_balance_size

Maximum relative size of the training data after balancing class counts (can be less than 1.0). Requires balance_classes. Defaults to 5.0.

max_runtime_secs

This argument specifies the maximum time that the AutoML process will run for, prior to training the final Stacked Ensemble models. If neither ‘max_runtime_secs’ nor ‘max_models’ are specified by the user, then ‘max_runtime_secs’ defaults to 3600 seconds (1 hour).

max_runtime_secs_per_model

Maximum runtime in seconds dedicated to each individual model training process. Use 0 to disable. Defaults to 0.

max_models

Maximum number of models to build in the AutoML process (does not include Stacked Ensembles). Defaults to NULL (no strict limit).

stopping_metric

Metric to use for early stopping ("AUTO" is logloss for classification, deviance for regression). Must be one of "AUTO", "deviance", "logloss", "MSE", "RMSE", "MAE", "RMSLE", "AUC", "AUCPR", "lift_top_group", "misclassification", "mean_per_class_error". Defaults to "AUTO".

stopping_tolerance

Relative tolerance for metric-based stopping criterion (stop if relative improvement is not at least this much). This value defaults to 0.001 if the dataset is at least 1 million rows; otherwise it defaults to a bigger value determined by the size of the dataset and the non-NA-rate. In that case, the value is computed as 1/sqrt(nrows * non-NA-rate).

stopping_rounds

Integer. Early stopping based on convergence of stopping_metric. Stop if simple moving average of length k of the stopping_metric does not improve for k (stopping_rounds) scoring events. Defaults to 3 and must be an non-zero integer. Use 0 to disable early stopping.

seed

Integer. Set a seed for reproducibility. AutoML can only guarantee reproducibility if max_models or early stopping is used because max_runtime_secs is resource limited, meaning that if the resources are not the same between runs, AutoML may be able to train more models on one run vs another.

project_name

Character string to identify an AutoML project. Defaults to NULL, which means a project name will be auto-generated.

exclude_algos

Vector of character strings naming the algorithms to skip during the model-building phase. An example use is exclude_algos = c("GLM", "DeepLearning", "DRF"), and the full list of options is: "DRF" (Random Forest and Extremely-Randomized Trees), "GLM", "XGBoost", "GBM", "DeepLearning" and "StackedEnsemble". Defaults to NULL, which means that all appropriate H2O algorithms will be used, if the search stopping criteria allow. Optional.

include_algos

Vector of character strings naming the algorithms to restrict to during the model-building phase. This can’t be used in combination with exclude_algos param. Defaults to NULL, which means that all appropriate H2O algorithms will be used, if the search stopping criteria allow. Optional.

modeling_plan

List. The list of modeling steps to be used by the AutoML engine (they may not all get executed, depending on other constraints). Optional (Expert usage only).
preprocessing  List. The list of preprocessing steps to run. Only 'target_encoding' is currently supported.

exploitation_ratio
The budget ratio (between 0 and 1) dedicated to the exploitation (vs exploration) phase. By default, the exploitation phase is disabled (exploitation_ratio=0) as this is still experimental; to activate it, it is recommended to try a ratio around 0.1. Note that the current exploitation phase only tries to fine-tune the best XGBoost and the best GBM found during exploration.

monotone_constraints
List. A mapping representing monotonic constraints. Use +1 to enforce an increasing constraint and -1 to specify a decreasing constraint.

keep_cross_validation_predictions
Logical. Whether to keep the predictions of the cross-validation predictions. This needs to be set to TRUE if running the same AutoML object for repeated runs because CV predictions are required to build additional Stacked Ensemble models in AutoML. This option defaults to FALSE.

keep_cross_validation_models
Logical. Whether to keep the cross-validated models. Keeping cross-validation models may consume significantly more memory in the H2O cluster. This option defaults to FALSE.

keep_cross_validation_fold_assignment
Logical. Whether to keep fold assignments in the models. Deleting them will save memory in the H2O cluster. Defaults to FALSE.

sort_metric
Metric to sort the leaderboard by. For binomial classification choose between "AUC", "AUCPR", "logloss", "mean_per_class_error", "RMSE", "MSE". For regression choose between "mean_residual_deviance", "RMSE", "MSE", "MAE", and "RMSLE". For multinomial classification choose between "mean_per_class_error", "logloss", "RMSE", "MSE". Default is "AUTO". If set to "AUTO", then "AUC" will be used for binomial classification, "mean_per_class_error" for multinomial classification, and "mean_residual_deviance" for regression.

export_checkpoints_dir
(Optional) Path to a directory where every model will be stored in binary form.

verbosity
Verbosity of the backend messages printed during training; Optional. Must be one of NULL (live log disabled), "debug", "info", "warn". Defaults to "warn".

... Additional (experimental) arguments to be passed through; Optional.

Details
AutoML finds the best model, given a training frame and response, and returns an H2OAutoML object, which contains a leaderboard of all the models that were trained in the process, ranked by a default model performance metric.

Value
An H2OAutoML object.
h2o.betweenss

Get the between cluster sum of squares

Description

Get the between cluster sum of squares. If "train", "valid", and "xval" parameters are FALSE (default), then the training betweenss value is returned. If more than one parameter is set to TRUE, then a named vector of betweenss’ are returned, where the names are "train", "valid" or "xval".

Usage

h2o.betweenss(object, train = FALSE, valid = FALSE, xval = FALSE)

Arguments

object  An H2OClusteringModel object.
train   Retrieve the training between cluster sum of squares
valid   Retrieve the validation between cluster sum of squares
xval    Retrieve the cross-validation between cluster sum of squares

Examples

## Not run:
library(h2o)
h2o.init()
predictors <- c("sepal_len", "sepal_wid", "petal_len", "petal_wid")
km <- h2o.kmeans(x = predictors, training_frame = fr, k = 3, nfolds = 3)
h2o.betweenss(km, train = TRUE)

## End(Not run)
h2o.biases

Return the respective bias vector

Description

Return the respective bias vector

Usage

h2o.biases(object, vector_id = 1)

Arguments

object
   An H2OModel or H2OModelMetrics

vector_id
   An integer, ranging from 1 to number of layers + 1, that specifies the bias vector to return.

Examples

## Not run:
library(h2o)
h2o.init()

f <- "https://h2o-public-test-data.s3.amazonaws.com/smalldata/chicago/chicagoCensus.csv"
census <- h2o.importFile(f)
census[, 1] <- as.factor(census[, 1])

dl_model <- h2o.deeplearning(x = c(1:3), y = 4, training_frame = census,
   hidden = c(17, 191),
   epochs = 1,
   balance_classes = FALSE,
   export_weights_and_biases = TRUE)
h2o.biases(dl_model, vector_id = 1)

## End(Not run)

h2o.bottomN

H2O bottomN

Description

bottomN function will grab the bottom N percent of values of a column and return it in a H2OFrame. Extract the top N percent of values of a column and return it in a H2OFrame.

Usage

h2o.bottomN(x, column, nPercent)
Arguments

- **x**: an H2OFrame
- **column**: is a column name or column index to grab the top N percent value from
- **nPercent**: is a bottom percentage value to grab

Value

An H2OFrame with 2 columns. The first column is the original row indices, second column contains the bottomN values

Examples

```r
## Not run:
library(h2o)
h2o.init()

f2 <- "https://s3.amazonaws.com/h2o-public-test-data/smalldata/jira/Bottom20Per.csv.zip"
data_Frame <- h2o.importFile(f1)
bottom_Answer <- h2o.importFile(f2)
nPercent <- c(1, 2, 3, 4)
frame_Names <- names(data_Frame)
nP <- nPercent[sample(1:length(nPercent), 1, replace = FALSE)]
col_Index <- sample(1:length(frame_Names), 1, replace = FALSE)
h2o.bottomN(data_Frame, frame_Names[col_Index], nP)

## End(Not run)
```

---

**h2o.cbind**

*Combine H2O Datasets by Columns*

**Description**

Takes a sequence of H2O data sets and combines them by column

**Usage**

```r
h2o.cbind(...)```

**Arguments**

- `...`: A sequence of H2OFrame arguments. All datasets must exist on the same H2O instance (IP and port) and contain the same number of rows.

**Value**

An H2OFrame object containing the combined arguments column-wise.
h2o.ceiling

See Also
cbind for the base R method.

Examples

## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
prostate_cbind <- h2o.cbind(prostate, prostate)
head(prostate_cbind)

## End(Not run)

h2o.ceiling

Take a single numeric argument and return a numeric vector with the smallest integers

Description
ceiling takes a single numeric argument x and returns a numeric vector containing the smallest integers not less than the corresponding elements of x.

Usage

h2o.ceiling(x)

Arguments

x An H2OFrame object.

See Also

Round for the base R implementation, ceiling().

Examples

## Not run:
library(h2o)
h2o.init()

iris <- h2o.importFile(f)
h2o.ceiling(iris[, 1])

## End(Not run)
h2o.centers

Retrieve the Model Centers

Description
Retrieve the Model Centers

Usage
h2o.centers(object)

Arguments
object An H2OClusteringModel object.

Examples
## Not run:
library(h2o)
h2o.init()
h2o.ceiling(fr[,1])
## End(Not run)

h2o.centersSTD

Retrieve the Model Centers STD

Description
Retrieve the Model Centers STD

Usage
h2o.centersSTD(object)

Arguments
object An H2OClusteringModel object.
h2o.centroid_stats

Examples

## Not run:
library(h2o)
h2o.init()
predictors <- c("sepal_len", "sepal_wid", "petal_len", "petal_wid")
km <- h2o.kmeans(x = predictors, training_frame = fr, k = 3, nfolds = 3)
h2o.centersSTD(km)

## End(Not run)

h2o.centroid_stats  Retrieve centroid statistics

Description
Retrieve the centroid statistics. If "train", "valid", and "xval" parameters are FALSE (default), then the training centroid stats value is returned. If more than one parameter is set to TRUE, then a named list of centroid stats data frames are returned, where the names are "train", "valid" or "xval".

Usage
h2o.centroid_stats(object, train = FALSE, valid = FALSE, xval = FALSE)

Arguments

object  An H2OClusteringModel object.

train  Retrieve the training centroid statistics

valid  Retrieve the validation centroid statistics

xval  Retrieve the cross-validation centroid statistics

Examples

## Not run:
library(h2o)
h2o.init()
predictors <- c("sepal_len", "sepal_wid", "petal_len", "petal_wid")
km <- h2o.kmeans(x = predictors, training_frame = fr, k = 3, nfolds = 3)
h2o.centroid_stats(km, train = TRUE)

## End(Not run)
h2o.clusterInfo

Print H2O cluster info

Description

Print H2O cluster info

Usage

h2o.clusterInfo()

h2o.clearLog

Delete All H2O R Logs

Description

Clear all H2O R command and error response logs from the local disk. Used primarily for debugging purposes.

Usage

h2o.clearLog()

See Also

h2o.startLogging, h2o.stopLogging, h2o.openLog

Examples

```r
## Not run:
library(h2o)
h2o.init()
h2o.startLogging()
australia_path = system.file("extdata", "australia.csv", package = "h2o")
australia = h2o.importFile(path = australia_path)
h2o.stopLogging()
h2o.clearLog()

## End(Not run)
```
**h2o.clusterIsUp**

Determine if an H2O cluster is up or not

**Description**

Determine if an H2O cluster is up or not

**Usage**

h2o.clusterIsUp(conn = h2o.getConnection())

**Arguments**

- **conn**  
  H2OConnection object

**Value**

TRUE if the cluster is up; FALSE otherwise

---

**h2o.clusterStatus**

Return the status of the cluster

**Description**

Retrieve information on the status of the cluster running H2O.

**Usage**

h2o.clusterStatus()

**See Also**

H2OConnection, h2o.init

**Examples**

```r
## Not run:
h2o.init()
h2o.clusterStatus()

## End(Not run)
```
**h2o.cluster_sizes**  
*Retrieve the cluster sizes*

**Description**

Retrieve the cluster sizes. If "train", "valid", and "xval" parameters are FALSE (default), then the training cluster sizes value is returned. If more than one parameter is set to TRUE, then a named list of cluster size vectors are returned, where the names are "train", "valid" or "xval".

**Usage**

```r
h2o.cluster_sizes(object, train = FALSE, valid = FALSE, xval = FALSE)
```

**Arguments**

- `object`  
  An `H2OClusteringModel` object.
- `train`  
  Retrieve the training cluster sizes
- `valid`  
  Retrieve the validation cluster sizes
- `xval`  
  Retrieve the cross-validation cluster sizes

**Examples**

```r
## Not run:
library(h2o)
h2o.init()
predictors <- c("sepal_len", "sepal_wid", "petal_len", "petal_wid")
km <- h2o.kmeans(x = predictors, training_frame = fr, k = 3, nfolds = 3)
h2o.cluster_sizes(km, train = TRUE)
## End(Not run)
```

---

**h2o.coef**  
*Return the coefficients that can be applied to the non-standardized data.*

**Description**

Note: `standardize = True` by default. If set to `False`, then `coef()` returns the coefficients that are fit directly.

**Usage**

```r
h2o.coef(object)
```
h2o.coef_norm

Arguments

object an H2OModel object.

Examples

```r
## Not run:
library(h2o)
h2o.init()

cars <- h2o.importFile(f)
predictors <- c("displacement", "power", "weight", "acceleration", "year")
response <- "cylinders"
cars_split <- h2o.splitFrame(data = cars, ratios = 0.8, seed = 1234)
train <- cars_split[[1]]
valid <- cars_split[[2]]
cars_glm <- h2o.glm(balance_classes = TRUE,
  seed = 1234,
  x = predictors,
  y = response,
  training_frame = train,
  validation_frame = valid)
h2o.coef(cars_glm)

## End(Not run)
```

h2o.coef_norm

Return coefficients fitted on the standardized data (requires standardize = True, which is on by default). These coefficients can be used to evaluate variable importance.

Description

Return coefficients fitted on the standardized data (requires standardize = True, which is on by default). These coefficients can be used to evaluate variable importance.

Usage

h2o.coef_norm(object)

Arguments

object an H2OModel object.
h2o.colnames

Return column names of an H2OFrame

Description

Return column names of an H2OFrame

Usage

h2o.colnames(x)

Arguments

x

An H2OFrame object.

See Also

colnames for the base R implementation.

Examples

## Not run:
library(h2o)
h2o.init()

cars <- h2o.importFile(f)
predictors <- c("displacement", "power", "weight", "acceleration", "year")
response <- "cylinders"
cars_split <- h2o.splitFrame(data = cars, ratios = 0.8, seed = 1234)
train <- cars_split[[1]]
valid <- cars_split[[2]]
cars_glm <- h2o.glm(balance_classes = TRUE,
  seed = 1234,
  x = predictors,
  y = response,
  training_frame = train,
  validation_frame = valid)
h2o.coef(cars_glm)

## End(Not run)
h2o.columns_by_type

Obtain a list of columns that are specified by 'coltype'

Description

Obtain a list of columns that are specified by 'coltype'

Usage

h2o.columns_by_type(object, coltype = "numeric", ...)

Arguments

object H2OFrame object

coltype A character string indicating which column type to filter by. This must be one of the following: "numeric" - Numeric, but not categorical or time "categorical" - Integer, with a categorical/factor String mapping "string" - String column "time" - Long msec since the Unix Epoch - with a variety of display/parse options "uuid" - UUID "bad" - No none-NA rows (triple negative! all NAs or zero rows)

... Ignored

Value

A list of column indices that correspond to "type"

Examples

## Not run:
h2o.init()
prostate_path <- system.file("exdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
h2o.columns_by_type(prostate, coltype = "numeric")

## End(Not run)
**h2o.computeGram**  
*Compute weighted gram matrix.*

**Description**

Compute weighted gram matrix.

**Usage**

```r
h2o.computeGram(
  X,
  weights = "",
  use_all_factor_levels = FALSE,
  standardize = TRUE,
  skip_missing = FALSE
)
```

**Arguments**

- `X`: an `H2OModel` corresponding to H2O frame.
- `weights`: character corresponding to name of weight vector in frame.
- `use_all_factor_levels`: logical flag telling h2o whether or not to skip first level of categorical variables during one-hot encoding.
- `standardize`: logical flag telling h2o whether or not to standardize data
- `skip_missing`: logical flag telling h2o whether skip rows with missing data or impute them with mean

**h2o.confusionMatrix**  
*Access H2O Confusion Matrices*

**Description**

Retrieve either a single or many confusion matrices from H2O objects.

**Usage**

```r
h2o.confusionMatrix(object, ...)
```

```r
## S4 method for signature 'H2OModel'
h2o.confusionMatrix(object, newdata, valid = FALSE, ...)
```

```r
## S4 method for signature 'H2OModelMetrics'
h2o.confusionMatrix(object, thresholds = NULL, metrics = NULL)
```
Arguments

- **object**: Either an `H2OModel` object or an `H2OModelMetrics` object.
- **newdata**: An H2OFrame object that can be scored on. Requires a valid response column.
- **valid**: Retrieve the validation metric.
- **thresholds**: (Optional) A value or a list of valid values between 0.0 and 1.0. This value is only used in the case of `H2OBinomialMetrics` objects.
- **metrics**: (Optional) A metric or a list of valid metrics ("min_per_class_accuracy", "absolute_mcc", "tnr", "fmr", "fpr", "tpr", "precision", "accuracy", "f0point5", "f2", "f1"). This value is only used in the case of `H2OBinomialMetrics` objects.

Details

The `H2OModelMetrics` version of this function will only take `H2OBinomialMetrics` or `H2OMultinomialMetrics` objects. If no threshold is specified, all possible thresholds are selected.

Value

Calling this function on `H2OModel` objects returns a confusion matrix corresponding to the `predict` function. If used on an `H2OBinomialMetrics` object, returns a list of matrices corresponding to the number of thresholds specified.

See Also

`predict` for generating prediction frames, `h2o.performance` for creating `H2OModelMetrics`.

Examples

```r
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(prostate_path)
prostate[, 2] <- as.factor(prostate[, 2])
model <- h2o.gbm(x = 3:9, y = 2, training_frame = prostate, distribution = "bernoulli")
h2o.confusionMatrix(model, prostate)
# Generating a ModelMetrics object
perf <- h2o.performance(model, prostate)
h2o.confusionMatrix(perf)
## End(Not run)
```
h2o.connect

Connect to a running H2O instance.

Description

Connect to a running H2O instance.

Usage

```r
h2o.connect(
  ip = "localhost",
  port = 54321,
  strict_version_check = TRUE,
  proxy = NA_character_,
  https = FALSE,
  cacert = NA_character_,
  insecure = FALSE,
  username = NA_character_,
  password = NA_character_,
  use_spnego = FALSE,
  cookies = NA_character_,
  context_path = NA_character_,
  config = NULL
)
```

Arguments

- **ip**: Object of class `character` representing the IP address of the server where H2O is running.
- **port**: Object of class `numeric` representing the port number of the H2O server.
- **strict_version_check**: (Optional) Setting this to `FALSE` is unsupported and should only be done when advised by technical support.
- **proxy**: (Optional) A `character` string specifying the proxy path.
- **https**: (Optional) Set this to `TRUE` to use `https` instead of `http`.
- **cacert**: Path to a CA bundle file with root and intermediate certificates of trusted CAs.
- **insecure**: (Optional) Set this to `TRUE` to disable SSL certificate checking.
- **username**: (Optional) Username to login with.
- **password**: (Optional) Password to login with.
- **use_spnego**: (Optional) Set this to `TRUE` to enable SPNEGO authentication.
- **cookies**: (Optional) Vector(or list) of cookies to add to request.
- **context_path**: (Optional) The last part of connection URL: `http://<ip>:<port>/<context_path>`
- **config**: (Optional) A list describing connection parameters. Using `config` makes `h2o.connect` ignore other parameters and collect named list members instead (see examples).
**Value**

an instance of H2OConnection object representing a connection to the running H2O instance.

**Examples**

```r
## Not run:
library(h2o)
# Try to connect to a H2O instance running at http://localhost:54321/cluster_X
# If not found, start a local H2O instance from R with the default settings.
#h2o.connect(ip = "localhost", port = 54321, context_path = "cluster_X")
# Or
#config = list(ip = "localhost", port = 54321, context_path = "cluster_X")
#h2o.connect(config = config)

# Skip strict version check during connecting to the instance
#h2o.connect(config = c(strict_version_check = FALSE, config))

## End(Not run)
```

---

**h2o.cor**

*Correlation of columns.*

**Description**

Compute the correlation matrix of one or two H2OFrames.

**Usage**

```r
h2o.cor(x, y = NULL, na.rm = FALSE, use, method = "Pearson")
cor(x, ...)
```

**Arguments**

- `x` An H2OFrame object.
- `y` NULL (default) or an H2OFrame. The default is equivalent to `y = x`.
- `na.rm` logical. Should missing values be removed?
- `use` An optional character string indicating how to handle missing values. This must be one of the following: "everything" - outputs NaNs whenever one of its contributing observations is missing "all.obs" - presence of missing observations will throw an error "complete.obs" - discards missing values along with all observations in their rows so that only complete observations are used
- `method` str. Method of correlation computation. Allowed values are: "Pearson" - Pearson's correlation coefficient "Spearman" - Spearman’s correlation coefficient (Spearman’s Rho) Defaults to "Pearson"
- `...` Further arguments to be passed down from other methods.
Examples

```r
## Not run:
library(h2o)
h2o.init()

prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
cor(prostate$AGE)

## End(Not run)
```

### h2o.cos

#### Description

Compute the cosine of x

#### Usage

```r
h2o.cos(x)
```

#### Arguments

- `x` An H2OFrame object.

#### See Also

`Trig` for the base R implementation, `cos()`.

#### Examples

```r
## Not run:
library(h2o)
h2o.init()

frame <- h2o.createFrame(rows = 6, cols = 2,
categorical_fraction = 0.0,
missing_fraction = 0.7,
seed = 123)

h2o.cos(frame["C1"])

## End(Not run)
```
h2o.cosh

*Compute the hyperbolic cosine of x*

**Description**

Compute the hyperbolic cosine of x

**Usage**

h2o.cosh(x)

**Arguments**

x  An H2OFrame object.

**See Also**

*Hyperbolic* for the base R implementation, cosh().

**Examples**

```r
## Not run:
library(h2o)
h2o.init()
frame <- h2o.createFrame(rows = 6, cols = 2,
categorical_fraction = 0.0,
missing_fraction = 0.7,
seed = 123)
h2o.cosh(frame["C1"])
## End(Not run)
```

---

h2o.coxph

*Trains a Cox Proportional Hazards Model (CoxPH) on an H2O dataset*

**Description**

Trains a Cox Proportional Hazards Model (CoxPH) on an H2O dataset
Usage

h2o.coxph(
  x,
  event_column,
  training_frame,
  model_id = NULL,
  start_column = NULL,
  stop_column = NULL,
  weights_column = NULL,
  offset_column = NULL,
  stratify_by = NULL,
  ties = c("efron", "breslow"),
  init = 0,
  lre_min = 9,
  max_iterations = 20,
  interactions = NULL,
  interaction_pairs = NULL,
  interactions_only = NULL,
  use_all_factor_levels = FALSE,
  export_checkpoints_dir = NULL,
  single_node_mode = FALSE
)

Arguments

x (Optional) A vector containing the names or indices of the predictor variables to use in building the model. If x is missing, then all columns except event_column, start_column and stop_column are used.

event_column The name of binary data column in the training frame indicating the occurrence of an event.

training_frame Id of the training data frame.

model_id Destination id for this model; auto-generated if not specified.

start_column Start Time Column.

stop_column Stop Time Column.

weights_column Column with observation weights. Giving some observation a weight of zero is equivalent to excluding it from the dataset; giving an observation a relative weight of 2 is equivalent to repeating that row twice. Negative weights are not allowed. Note: Weights are per-row observation weights and do not increase the size of the data frame. This is typically the number of times a row is repeated, but non-integer values are supported as well. During training, rows with higher weights matter more, due to the larger loss function pre-factor.

offset_column Offset column. This will be added to the combination of columns before applying the link function.

stratify_by List of columns to use for stratification.

ties Method for Handling Ties. Must be one of: "efron", "breslow". Defaults to efron.
h2o.createFrame

**Description**

Creates a data frame in H2O with real-valued, categorical, integer, and binary columns specified by the user.

---

**Examples**

```r
## Not run:
library(h2o)
h2o.init()

# Import the heart dataset
f <- "https://s3.amazonaws.com/h2o-public-test-data/smalldata/coxph_test/heart.csv"
heart <- h2o.importFile(f)

# Set the predictor and response
predictor <- "age"
response <- "event"

# Train a Cox Proportional Hazards model
heart_coxph <- h2o.coxph(x = predictor, training_frame = heart,
                        event_column = "event",
                        start_column = "start",
                        stop_column = "stop")

## End(Not run)
```
Usage

```r
h2o.createFrame(
  rows = 10000,
  cols = 10,
  randomize = TRUE,
  value = 0,
  real_range = 100,
  categorical_fraction = 0.2,
  factors = 100,
  integer_fraction = 0.2,
  integer_range = 100,
  binary_fraction = 0.1,
  binary_ones_fraction = 0.02,
  time_fraction = 0,
  string_fraction = 0,
  missing_fraction = 0.01,
  response_factors = 2,
  has_response = FALSE,
  seed,
  seed_for_column_types
)
```

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rows</td>
<td>The number of rows of data to generate.</td>
</tr>
<tr>
<td>cols</td>
<td>The number of columns of data to generate. Excludes the response column if has_response = TRUE.</td>
</tr>
<tr>
<td>randomize</td>
<td>A logical value indicating whether data values should be randomly generated. This must be TRUE if either categorical_fraction or integer_fraction is non-zero.</td>
</tr>
<tr>
<td>value</td>
<td>If randomize = FALSE, then all real-valued entries will be set to this value.</td>
</tr>
<tr>
<td>real_range</td>
<td>The range of randomly generated real values.</td>
</tr>
<tr>
<td>categorical_fraction</td>
<td>The fraction of total columns that are categorical.</td>
</tr>
<tr>
<td>factors</td>
<td>The number of (unique) factor levels in each categorical column.</td>
</tr>
<tr>
<td>integer_fraction</td>
<td>The fraction of total columns that are integer-valued.</td>
</tr>
<tr>
<td>integer_range</td>
<td>The range of randomly generated integer values.</td>
</tr>
<tr>
<td>binary_fraction</td>
<td>The fraction of total columns that are binary-valued.</td>
</tr>
<tr>
<td>binary_ones_fraction</td>
<td>The fraction of values in a binary column that are set to 1.</td>
</tr>
<tr>
<td>time_fraction</td>
<td>The fraction of randomly created date/time columns.</td>
</tr>
<tr>
<td>string_fraction</td>
<td>The fraction of randomly created string columns.</td>
</tr>
</tbody>
</table>
missing_fraction
The fraction of total entries in the data frame that are set to NA.

response_factors
If has_response = TRUE, then this is the number of factor levels in the response column.

has_response
A logical value indicating whether an additional response column should be prepended to the final H2O data frame. If set to TRUE, the total number of columns will be cols+1.

seed
A seed used to generate random values when randomize = TRUE.

seed_for_column_types
A seed used to generate random column types when randomize = TRUE.

**Value**
Returns an H2OFrame object.

**Examples**
```r
## Not run:
library(h2o)
h2o.init()
hf <- h2o.createFrame(rows = 1000, cols = 100, categorical_fraction = 0.1,
                      factors = 5, integer_fraction = 0.5, integer_range = 1,
                      has_response = TRUE)
head(hf)
summary(hf)

hf <- h2o.createFrame(rows = 100, cols = 10, randomize = FALSE, value = 5,
                      categorical_fraction = 0, integer_fraction = 0)
summary(hf)
## End(Not run)
```

---

**h2o.cross_validation_fold_assignment**

*Retrieve the cross-validation fold assignment*

**Description**
Retrieve the cross-validation fold assignment

**Usage**
```r
h2o.cross_validation_fold_assignment(object)
```

**Arguments**
- `object`  
  An H2OModel object.
Value

Returns a H2OFrame

Examples

```r
## Not run:
library(h2o)
h2o.init()

cars <- h2o.importFile(f)
cars["economy_20mpg"] <- as.factor(cars["economy_20mpg"])
predictors <- c("displacement", "power", "weight", "acceleration", "year")
response <- "economy_20mpg"
cars_split <- h2o.splitFrame(data = cars, ratios = 0.8, seed = 1234)
train <- cars_split[[1]]
valid <- cars_split[[2]]
cars_gbm <- h2o.gbm(x = predictors, y = response, training_frame = train,
                   nfolds = 5, keep_cross_validation_fold_assignment = TRUE, seed = 1234)
h2o.cross_validation_fold_assignment(cars_gbm)

## End(Not run)
```

---

**h2o.cross_validation_holdout_predictions**

Retrieve the cross-validation holdout predictions

---

**Description**

Retrieve the cross-validation holdout predictions

**Usage**

```
h2o.cross_validation_holdout_predictions(object)
```

**Arguments**

- `object` An `H2OModel` object.

**Value**

Returns a H2OFrame
## h2o.cross_validation_models

### Examples

```r
## Not run:
library(h2o)
h2o.init()

cars <- h2o.importFile(f)
cars["economy_20mpg"] <- as.factor(cars["economy_20mpg"])
predictors <- c("displacement", "power", "weight", "acceleration", "year")
response <- "economy_20mpg"
cars_split <- h2o.splitFrame(data = cars, ratios = 0.8, seed = 1234)
train <- cars_split[[1]]
valid <- cars_split[[2]]
cars_gbm <- h2o.gbm(x = predictors, y = response, training_frame = train,
nfolds = 5, keep_cross_validation_predictions = TRUE, seed = 1234)
h2o.cross_validation_holdout_predictions(cars_gbm)

## End(Not run)
```

### h2o.cross_validation_models

*Retrieve the cross-validation models*

### Description

Retrieve the cross-validation models

### Usage

```r
h2o.cross_validation_models(object)
```

### Arguments

- **object**: An H2OModel object.

### Value

Returns a list of H2OModel objects

### Examples

```r
## Not run:
library(h2o)
h2o.init()

cars <- h2o.importFile(f)
cars["economy_20mpg"] <- as.factor(cars["economy_20mpg"])
predictors <- c("displacement", "power", "weight", "acceleration", "year")
```
response <- "economy_20mpg"
cars_split <- h2o.splitFrame(data = cars, ratios = 0.8, seed = 1234)
train <- cars_split[[1]]
valid <- cars_split[[2]]
cars_gbm <- h2o.gbm(x = predictors, y = response, training_frame = train,
nfolds = 5, keep_cross_validation_models = TRUE, seed = 1234)
h2o.cross_validation_models(cars_gbm)

## End(Not run)

---

**h2o.cross_validation_predictions**

*Retrieve the cross-validation predictions*

**Description**

Retrieve the cross-validation predictions

**Usage**

h2o.cross_validation_predictions(object)

**Arguments**

- **object** An H2OModel object.

**Value**

Returns a list of H2OFrame objects

**Examples**

```r
## Not run:
library(h2o)
h2o.init()

cars <- h2o.importFile(f)
cars["economy_20mpg"] <- as.factor(cars["economy_20mpg"])
predictors <- c("displacement", "power", "weight", "acceleration", "year")
response <- "economy_20mpg"
cars_split <- h2o.splitFrame(data = cars, ratios = 0.8, seed = 1234)
train <- cars_split[[1]]
valid <- cars_split[[2]]
cars_gbm <- h2o.gbm(x = predictors, y = response, training_frame = train,
nfolds = 5, keep_cross_validation_predictions = TRUE, seed = 1234)
h2o.cross_validation_predictions(cars_gbm)

## End(Not run)
```
h2o.cummax

Return the cumulative max over a column or across a row

Description

Return the cumulative max over a column or across a row

Usage

h2o.cummax(x, axis = 0)

Arguments

x An H2OFrame object.
axis An int that indicates whether to do down a column (0) or across a row (1).

See Also
cumsum for the base R implementation, cummax().

Examples

## Not run:
library(h2o)
h2o.init()

frame <- h2o.createFrame(rows = 6, cols = 2,
categorical_fraction = 0.0,
missing_fraction = 0.7,
seed = 123)

h2o.cummax(frame, 1)

## End(Not run)

h2o.cummin

Return the cumulative min over a column or across a row

Description

Return the cumulative min over a column or across a row

Usage

h2o.cummin(x, axis = 0)
Arguments

x     An H2OFrame object.
axis  An int that indicates whether to do down a column (0) or across a row (1).

See Also

cumsum for the base R implementation, cummin().

Examples

## Not run:
library(h2o)
h2o.init()

frame <- h2o.createFrame(rows = 6, cols = 2,
categorical_fraction = 0.0,
missing_fraction = 0.7,
seed = 123)
h2o.cummin(frame, 1)
## End(Not run)
Examples

## Not run:
library(h2o)
h2o.init()

frame <- h2o.createFrame(rows = 6, cols = 2,
categorical_fraction = 0.0,
missing_fraction = 0.7,
seed = 123)
h2o.cumprod(frame, 1)

## End(Not run)

### Usage

h2o.cumsum(x, axis = 0)

### Arguments

- **x**: An H2OFrame object.
- **axis**: An int that indicates whether to do down a column (0) or across a row (1).

### See Also

cumsum for the base R implementation.

Examples

## Not run:
library(h2o)
h2o.init()

frame <- h2o.createFrame(rows = 6, cols = 2,
categorical_fraction = 0.0,
missing_fraction = 0.7,
seed = 123)
h2o.cumsum(frame, 1)

## End(Not run)
**h2o.cut**  
*Cut H2O Numeric Data to Factor*

**Description**
Divides the range of the H2O data into intervals and codes the values according to which interval they fall in. The leftmost interval corresponds to the level one, the next is level two, etc.

**Usage**

```r
h2o.cut(
  x,
  breaks,
  labels = NULL,
  include.lowest = FALSE,
  right = TRUE,
  dig.lab = 3,
  ...
)
```

```r
cut(  
  x,
  breaks,
  labels = NULL,
  include.lowest = FALSE,
  right = TRUE,
  dig.lab = 3,
  ...
)
```

**Arguments**
- `x` An H2OFrame object with a single numeric column.
- `breaks` A numeric vector of two or more unique cut points.
- `labels` Labels for the levels of the resulting category. By default, labels are constructed using ",(a,b]\" interval notation.
- `include.lowest` Logical, indicating if an 'x[i]' equal to the lowest (or highest, for right = FALSE 'breaks' value should be included.
- `right` Logical, indicating if the intervals should be closed on the right (opened on the left) or vice versa.
- `dig.lab` Integer which is used when labels are not given, determines the number of digits used in formatting the break numbers.
- `...` Further arguments passed to or from other methods.
Value

Returns an H2OFrame object containing the factored data with intervals as levels.

Examples

```r
## Not run:
library(h2o)
h2o.init()
iris_hf <- as.h2o(iris)
summary(iris_hf)

# Cut sepal length column into intervals determined by min/max/quantiles
sepal_len_cut <- cut(iris_hf$Sepal.Length, c(4.2, 4.8, 5.8, 6, 8))
head(sepal_len_cut)
summary(sepal_len_cut)

## End(Not run)
```

---

**h2o.day**

| Convert Milliseconds to Day of Month in H2O Datasets |

Description

Converts the entries of an H2OFrame object from milliseconds to days of the month (on a 1 to 31 scale).

Usage

```r
h2o.day(x)
day(x)
```

## S3 method for class 'H2OFrame'

day(x)

Arguments

- **x**
  
  An H2OFrame object.

Value

An H2OFrame object containing the entries of `x` converted to days of the month.

See Also

h2o.month
### h2o.dayOfWeek

**Convert Milliseconds to Day of Week in H2O Datasets**

**Description**

Converts the entries of an H2OFrame object from milliseconds to days of the week (on a 0 to 6 scale).

**Usage**

```r
h2o.dayOfWeek(x)
```

```r
dayOfWeek(x)
```

```r
## S3 method for class 'H2OFrame'
dayOfWeek(x)
```

**Arguments**

- `x` An H2OFrame object.

**Value**

An H2OFrame object containing the entries of `x` converted to days of the week.

**See Also**

- `h2o.day`, `h2o.month`

### h2o.dct

**Compute DCT of an H2OFrame**

**Description**

Compute the Discrete Cosine Transform of every row in the H2OFrame

**Usage**

```r
h2o.dct(data, destination_frame, dimensions, inverse = FALSE)
```
Arguments

- **data**: An H2OFrame object representing the dataset to transform.
- **destination_frame**: A frame ID for the result.
- **dimensions**: An array containing the 3 integer values for height, width, depth of each sample. The product of HxWxD must total up to less than the number of columns. For 1D, use c(L,1,1), for 2D, use C(N,M,1).
- **inverse**: Whether to perform the inverse transform.

Value

Returns an H2OFrame object.

Examples

```r
## Not run:
library(h2o)
h2o.init()
df <- h2o.createFrame(rows = 1000, cols = 8 * 16 * 24,
categorical_fraction = 0, integer_fraction = 0, missing_fraction = 0)
df1 <- h2o.dct(data = df, dimensions = c(8 * 16 * 24, 1, 1))
df2 <- h2o.dct(data = df1, dimensions = c(8 * 16 * 24, 1, 1), inverse = TRUE)
max(abs(df1 - df2))

df1 <- h2o.dct(data = df, dimensions = c(8 * 16, 24, 1))
df2 <- h2o.dct(data = df1, dimensions = c(8 * 16, 24, 1), inverse = TRUE)
max(abs(df1 - df2))

df1 <- h2o.dct(data = df, dimensions = c(8, 16, 24))
df2 <- h2o.dct(data = df1, dimensions = c(8, 16, 24), inverse = TRUE)
max(abs(df1 - df2))

## End(Not run)
```
Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>X</td>
<td>An H2OFrame object to be processed.</td>
</tr>
<tr>
<td>.variables</td>
<td>Variables to split X by, either the indices or names of a set of columns.</td>
</tr>
<tr>
<td>FUN</td>
<td>Function to apply to each subset grouping.</td>
</tr>
<tr>
<td>...</td>
<td>Additional arguments passed on to FUN.</td>
</tr>
<tr>
<td>.progress</td>
<td>Name of the progress bar to use. #TODO: (Currently unimplemented)</td>
</tr>
</tbody>
</table>

Value

Returns an H2OFrame object containing the results from the split/apply operation, arranged

Examples

```r
## Not run:
library(h2o)
h2o.init()

iris_hf <- as.h2o(iris)
fun <- function(df) { sum(df[,1], na.rm = TRUE) / nrow(df) }
res <- h2o.ddply(iris_hf, "Species", fun)
head(res)

## End(Not run)
```

h2o.decryptionSetup

Setup a Decryption Tool

Description

If your source file is encrypted - setup a Decryption Tool and then provide the reference (result of this function) to the import functions.

Usage

```r
h2o.decryptionSetup(
  keystore,
  keystore_type = "JCEKS",
  key_alias = NA_character_,
  password = NA_character_,
  decrypt_tool = "",
  decrypt_impl = "water.parser.GenericDecryptionTool",
  cipher_spec = NA_character_
)
```
Arguments

- **keystore**: An H2OFrame object referencing a loaded Java Keystore (see example).
- **keystore_type**: (Optional) Specification of Keystore type, defaults to JCEKS.
- **key_alias**: Which key from the keystore to use for decryption.
- **password**: Password to the keystore and the key.
- **decrypt_tool**: (Optional) Name of the decryption tool.
- **decrypt_impl**: (Optional) Java class name implementing the Decryption Tool.
- **cipher_spec**: Specification of a cipher (eg.: AES/ECB/PKCS5Padding).

See Also

- `h2o.importFile`, `h2o.parseSetup`

Examples

```r
## Not run:
library(h2o)
h2o.init()
ks_path <- system.file("extdata", "keystore.jks", package = "h2o")
keystore <- h2o.importFile(path = ks_path, parse = FALSE) # don't parse, keep as a binary file
cipher <- "AES/ECB/PKCS5Padding"
pwd <- "Password123"
alias <- "secretKeyAlias"
dt <- h2o.decryptionSetup(keystore, key_alias = alias, password = pwd, cipher_spec = cipher)
data_path <- system.file("extdata", "prostate.csv.aes", package = "h2o")
data <- h2o.importFile(data_path, decrypt_tool = dt)
summary(data)
## End(Not run)
```

---

**h2o.deepfeatures**  
*Feature Generation via H2O Deep Learning*

**Description**

Extract the non-linear feature from an H2O data set using an H2O deep learning model.

**Usage**

```r
h2o.deepfeatures(object, data, layer)
```

**Arguments**

- **object**: An H2OModel object that represents the deep learning model to be used for feature extraction.
- **data**: An H2OFrame object.
- **layer**: Index (integer) of the hidden layer to extract.
Value

Returns an H2OFrame object with as many features as the number of units in the hidden layer of
the specified index.

See Also

h2o.deeplearning for making H2O Deep Learning models.

Examples

```r
## Not run:
library(h2o)
h2o.init()
prostate_path = system.file("extdata", "prostate.csv", package = "h2o")
prostate = h2o.importFile(path = prostate_path)
prostate_dl = h2o.deeplearning(x = 3:9, y = 2, training_frame = prostate,
   hidden = c(100, 200), epochs = 5)
prostate_deepfeatures_layer1 = h2o.deepfeatures(prostate_dl, prostate, layer = 1)
prostate_deepfeatures_layer2 = h2o.deepfeatures(prostate_dl, prostate, layer = 2)
head(prostate_deepfeatures_layer1)
head(prostate_deepfeatures_layer2)

## End(Not run)
```

h2o.deeplearning

Build a Deep Neural Network model using CPUs

Description

Builds a feed-forward multilayer artificial neural network on an H2OFrame.

Usage

```r
h2o.deeplearning(
  x,
  y,

verbose = FALSE
)

Arguments

x (Optional) A vector containing the names or indices of the predictor variables to use in building the model. If x is missing, then all columns except y are used.

y The name or column index of the response variable in the data. The response must be either a numeric or a categorical/factor variable. If the response is numeric, then a regression model will be trained, otherwise it will train a classification model.

training_frame Id of the training data frame.
model_id Destination id for this model; auto-generated if not specified.
validation_frame Id of the validation data frame.
nfolds
Number of folds for K-fold cross-validation (0 to disable or >= 2). Defaults to 0.

keep_cross-validation_models
Logical. Whether to keep the cross-validation models. Defaults to TRUE.

keep_cross-validation_predictions
Logical. Whether to keep the predictions of the cross-validation models. Defaults to FALSE.

keep_cross-validation_fold_assignment
Logical. Whether to keep the cross-validation fold assignment. Defaults to FALSE.

fold_assignment
Cross-validation fold assignment scheme, if fold_column is not specified. The 'Stratified' option will stratify the folds based on the response variable, for classification problems. Must be one of: "AUTO", "Random", "Modulo", "Stratified". Defaults to AUTO.

fold_column
Column with cross-validation fold index assignment per observation.

ignore_const_cols
Logical. Ignore constant columns. Defaults to TRUE.

score_each_iteration
Logical. Whether to score during each iteration of model training. Defaults to FALSE.

weights_column
Column with observation weights. Giving some observation a weight of zero is equivalent to excluding it from the dataset; giving an observation a relative weight of 2 is equivalent to repeating that row twice. Negative weights are not allowed. Note: Weights are per-row observation weights and do not increase the size of the data frame. This is typically the number of times a row is repeated, but non-integer values are supported as well. During training, rows with higher weights matter more, due to the larger loss function pre-factor.

offset_column
Offset column. This will be added to the combination of columns before applying the link function.

balance_classes
Logical. Balance training data class counts via over/under-sampling (for imbalanced data). Defaults to FALSE.

class_sampling_factors
Desired over/under-sampling ratios per class (in lexicographic order). If not specified, sampling factors will be automatically computed to obtain class balance during training. Requires balance_classes.

max_after_balance_size
Maximum relative size of the training data after balancing class counts (can be less than 1.0). Requires balance_classes. Defaults to 5.0.

checkpoint
Model checkpoint to resume training with.

pretrained_autoencoder
Pretrained autoencoder model to initialize this model with.

overwrite_with_best_model
Logical. If enabled, override the final model with the best model found during training. Defaults to TRUE.
use_all_factor_levels
Logical. Use all factor levels of categorical variables. Otherwise, the first factor level is omitted (without loss of accuracy). Useful for variable importances and auto-enabled for autoencoder. Defaults to TRUE.

standardize Logical. If enabled, automatically standardize the data. If disabled, the user must provide properly scaled input data. Defaults to TRUE.

hidden Hidden layer sizes (e.g. [100, 100]). Defaults to c(200, 200).

epochs How many times the dataset should be iterated (streamed), can be fractional. Defaults to 10.

train_samples_per_iteration Number of training samples (globally) per MapReduce iteration. Special values are 0: one epoch, -1: all available data (e.g., replicated training data), -2: automatic. Defaults to -2.

target_ratio_comm_to_comp Target ratio of communication overhead to computation. Only for multi-node operation and train_samples_per_iteration = -2 (auto-tuning). Defaults to 0.05.

seed Seed for random numbers (affects certain parts of the algo that are stochastic and those might or might not be enabled by default). Note: only reproducible when running single threaded. Defaults to -1 (time-based random number).

adaptive_rate Logical. Adaptive learning rate. Defaults to TRUE.

rho Adaptive learning rate time decay factor (similarity to prior updates). Defaults to 0.99.

epsilon Adaptive learning rate smoothing factor (to avoid divisions by zero and allow progress). Defaults to 1e-08.

rate Learning rate (higher => less stable, lower => slower convergence). Defaults to 0.005.

rate_annealing Learning rate annealing: rate / (1 + rate_annealing * samples). Defaults to 1e-06.

rate_decay Learning rate decay factor between layers (N-th layer: rate * rate_decay ^ (n - 1). Defaults to 1.

momentum_start Initial momentum at the beginning of training (try 0.5). Defaults to 0.

momentum_ramp Number of training samples for which momentum increases. Defaults to 1000000.

momentum_stable Final momentum after the ramp is over (try 0.99). Defaults to 0.

nesterov_accelerated_gradient Logical. Use Nesterov accelerated gradient (recommended). Defaults to TRUE.

input_dropout_ratio Input layer dropout ratio (can improve generalization, try 0.1 or 0.2). Defaults to 0.

hidden_dropout_ratios Hidden layer dropout ratios (can improve generalization), specify one value per hidden layer, defaults to 0.5.
L1 regularization (can add stability and improve generalization, causes many weights to become 0). Defaults to 0.

L2 regularization (can add stability and improve generalization, causes many weights to be small. Defaults to 0.

Constraint for squared sum of incoming weights per unit (e.g. for Rectifier). Defaults to 3.4028235e+38.

A list of H2OFrame ids to initialize the weight matrices of this model with.

A list of H2OFrame ids to initialize the bias vectors of this model with.

Distribution function Must be one of: "AUTO", "bernoulli", "multinomial", "gaussian", "poisson", "gamma", "tweedie", "laplace", "quantile", "huber". Defaults to AUTO.

Desired quantile for Quantile regression, must be between 0 and 1. Defaults to 0.5.

Tweedie power for Tweedie regression, must be between 1 and 2. Defaults to 1.5.

Desired quantile for Huber/M-regression (threshold between quadratic and linear loss, must be between 0 and 1). Defaults to 0.9.

Shortest time interval (in seconds) between model scoring. Defaults to 5.

Number of training set samples for scoring (0 for all). Defaults to 10000.

Number of validation set samples for scoring (0 for all). Defaults to 0.

Maximum duty cycle fraction for scoring (lower: more training, higher: more scoring). Defaults to 0.1.

Stopping criterion for classification error fraction on training data (-1 to disable). Defaults to 0.

Stopping criterion for regression error (MSE) on training data (-1 to disable). Defaults to 1e-06.

Early stopping based on convergence of stopping_metric. Stop if simple moving average of length k of the stopping_metric does not improve for k:=stopping_rounds scoring events (0 to disable) Defaults to 5.
stopping_metric
Metric to use for early stopping (AUTO: logloss for classification, deviance for regression and anomaly_score for Isolation Forest). Note that custom and custom_increasing can only be used in GBM and DRF with the Python client. Must be one of: "AUTO", "deviance", "logloss", "MSE", "RMSE", "MAE", "RMSLE", "AUC", "AUCPR", "lift_top_group", "misclassification", "mean_per_class_error", "custom", "custom_increasing". Defaults to AUTO.

stopping_tolerance
Relative tolerance for metric-based stopping criterion (stop if relative improvement is not at least this much) Defaults to 0.

max_runtime_secs
Maximum allowed runtime in seconds for model training. Use 0 to disable. Defaults to 0.

score_validation_sampling
Method used to sample validation dataset for scoring. Must be one of: "Uniform", "Stratified". Defaults to Uniform.

diagnostics Logical. Enable diagnostics for hidden layers. Defaults to TRUE.

fast_mode Logical. Enable fast mode (minor approximation in back-propagation). Defaults to TRUE.

force_load_balance Logical. Force extra load balancing to increase training speed for small datasets (to keep all cores busy). Defaults to TRUE.

variable_importances Logical. Compute variable importances for input features (Gedeon method) - can be slow for large networks. Defaults to TRUE.

replicate_training_data Logical. Replicate the entire training dataset onto every node for faster training on small datasets. Defaults to TRUE.

single_node_mode Logical. Run on a single node for fine-tuning of model parameters. Defaults to FALSE.

shuffle_training_data Logical. Enable shuffling of training data (recommended if training data is replicated and train_samples_per_iteration is close to #nodes x #rows, of if using balance_classes). Defaults to FALSE.

missing_values_handling
Handling of missing values. Either MeanImputation or Skip. Must be one of: "MeanImputation", "Skip". Defaults to MeanImputation.

quiet_mode Logical. Enable quiet mode for less output to standard output. Defaults to FALSE.

autoencoder Logical. Auto-Encoder. Defaults to FALSE.

sparse Logical. Sparse data handling (more efficient for data with lots of 0 values). Defaults to FALSE.

col_major Logical. #DEPRECATED Use a column major weight matrix for input layer. Can speed up forward propagation, but might slow down backpropagation. Defaults to FALSE.
average_activation
   Average activation for sparse auto-encoder. #Experimental Defaults to 0.
sparsity_beta
   Sparsity regularization. #Experimental Defaults to 0.
max_categorical_features
   Max. number of categorical features, enforced via hashing. #Experimental De-
   fault to 2147483647.
reproducible
   Logical. Force reproducibility on small data (will be slow - only uses 1 thread).
   Defaults to FALSE.
export_weights_and_biases
   Logical. Whether to export Neural Network weights and biases to H2O Frames.
   Defaults to FALSE.
mini_batch_size
   Mini-batch size (smaller leads to better fit, larger can speed up and generalize
   better). Defaults to 1.
categorical_encoding
   Encoding scheme for categorical features Must be one of: "AUTO", "Enum",
   "OneHotInternal", "OneHotExplicit", "Binary", "Eigen", "LabelEncoder", "Sort-
   ByResponse", "EnumLimited". Defaults to AUTO.
elastic_averaging
   Logical. Elastic averaging between compute nodes can improve distributed
   model convergence. #Experimental Defaults to FALSE.
elastic_averaging_moving_rate
   Elastic averaging moving rate (only if elastic averaging is enabled). Defaults to
   0.9.
elastic_averaging_regularization
   Elastic averaging regularization strength (only if elastic averaging is enabled).
   Defaults to 0.001.
export_checkpoints_dir
   Automatically export generated models to this directory.
auc_type
   Set default multinomial AUC type. Must be one of: "AUTO", "NONE", "MACRO_OVR",
   "WEIGHTED_OVR", "MACRO_OVO", "WEIGHTED_OVO". Defaults to AUTO.
verbose
   Logical. Print scoring history to the console (Metrics per epoch). Defaults to
   FALSE.

predict.H2OModel for prediction

Examples

## Not run:
library(h2o)
h2o.init()
iris_hf <- as.h2o(iris)
iris_dl <- h2o.deeplearning(x = 1:4, y = 5, training_frame = iris_hf, seed=123456)
# now make a prediction
predictions <- h2o.predict(iris_dl, iris_hf)
**h2o.describe**  
*H2O Description of A Dataset*

**Description**
Reports the "Flow" style summary rollups on an instance of H2OFrame. Includes information about column types, mins/maxs/missing/zero counts/stds/number of levels

**Usage**
```
h2o.describe(frame)
```

**Arguments**
- `frame`  
  An H2OFrame object.

**Value**
A table with the Frame stats.

**Examples**
```
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.importFile(path = prostate_path)
h2o.describe(prostate)
## End(Not run)
```

**h2o.difflag1**  
*Conduct a lag 1 transform on a numeric H2OFrame column*

**Description**
Conduct a lag 1 transform on a numeric H2OFrame column

**Usage**
```
h2o.difflag1(object)
```

**Arguments**
- `object`  
  H2OFrame object
h2o.dim

Returns the number of rows and columns for an H2OFrame object.

Description

Returns the number of rows and columns for an H2OFrame object.

Usage

h2o.dim(x)

Arguments

x An H2OFrame object.

See Also

dim for the base R implementation.

Examples

## Not run:
library(h2o)
h2o.init()

cars <- h2o.importFile(f)
predictors <- c("displacement", "power", "weight", "acceleration", "year")
response <- "cylinders"
cars_split <- h2o.splitFrame(data = cars, ratios = 0.8, seed = 1234)
train <- cars_split[[1]]
valid <- cars_split[[2]]
cars_gbm <- h2o.gbm(x = predictors, y = response, training_frame = train,
validation_frame = valid, nfolds = 5, seed = 1234)
h2o.dim(cars["cylinders"])

## End(Not run)
h2o.distance

Compute a pairwise distance measure between all rows of two numeric H2OFrames.

Description

Compute a pairwise distance measure between all rows of two numeric H2OFrames.

Usage

h2o.distance(x, y, measure)

declaration

h2o.distance

h2o.distance(cars)

## End(Not run)

h2o.dimnames

Column names of an H2OFrame

Description

Column names of an H2OFrame

Usage

h2o.dimnames(x)

Arguments

x An H2OFrame object.

See Also

dimnames for the base R implementation.

Examples

## Not run:
library(h2o)
h2o.init()
cars <- h2o.importFile(f)
h2o.dimnames(cars)

## End(Not run)
Arguments

- **x**: An H2OFrame object (large, references).
- **y**: An H2OFrame object (small, queries).
- **measure**: An optional string indicating what distance measure to use. Must be one of: "l1" - Absolute distance (L1-norm, \(\geq 0\)) "l2" - Euclidean distance (L2-norm, \(\geq 0\)) "cosine" - Cosine similarity (-1...1) "cosine_sq" - Squared Cosine similarity (0...1)

Examples

```r
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
h2o.distance(prostate[11:30, ], prostate[1:10, ], "cosine")
## End(Not run)
```

---

**h2o.downloadAllLogs**  
**Download H2O Log Files to Disk**

**Description**

h2o.downloadAllLogs downloads all H2O log files to local disk in .zip format. Generally used for debugging purposes.

**Usage**

```r
h2o.downloadAllLogs(dirname = ".", filename = NULL)
```

**Arguments**

- **dirname**: (Optional) A character string indicating the directory that the log file should be saved in.
- **filename**: (Optional) A character string indicating the name that the log file should be saved to. Note that the saved format is .zip, so the file name must include the .zip extension.

**Examples**

```r
## Not run:
h2o.downloadAllLogs(dirname='./your_directory_name/', filename = 'autoh2o_log.zip')
## End(Not run)
```
h2o.downloadCSV  Download H2O Data to Disk

Description

Download an H2O data set to a CSV file on the local disk

Usage

h2o.downloadCSV(data, filename)

Arguments

data an H2OFrame object to be downloaded.
filename A string indicating the name that the CSV file should be saved to.

Warning

Files located on the H2O server may be very large! Make sure you have enough hard drive space to accommodate the entire file.

Examples

## Not run:
library(h2o)
h2o.init()
iris_hf <- as.h2o(iris)

file_path <- paste(getwd(), "my_iris_file.csv", sep = .Platform$file.sep)
h2o.downloadCSV(iris_hf, file_path)
file.info(file_path)
file.remove(file_path)

## End(Not run)

h2o.download_model  Download the model in binary format. The owner of the file saved is the user by which python session was executed.

Description

Download the model in binary format. The owner of the file saved is the user by which python session was executed.
Usage

h2o.download_model(
    model,
    path = NULL,
    export_cross_validation_predictions = FALSE
)

Arguments

model          An H2OModel
path           The path where binary file should be downloaded. Downloaded to current directory by default.
export_cross_validation_predictions
               A boolean flag indicating whether the download model should be saved with CV Holdout Frame predictions. Default is not to export the predictions.

Examples

## Not run:
library(h2o)
h <- h2o.init()
fr <- as.h2o(iris)
my_model <- h2o.gbm(x = 1:4, y = 5, training_frame = fr)
h2o.download_model(my_model) # save to the current working directory

## End(Not run)

h2o.download_mojo  Download the model in MOJO format.

Description

Download the model in MOJO format.

Usage

h2o.download_mojo(
    model,
    path = getwd(),
    get_genmodel_jar = FALSE,
    genmodel_name = "",
    genmodel_path = ""
)
Arguments

model An H2OModel

path The path where MOJO file should be saved. Saved to current directory by default.

get_genmodel_jar If TRUE, then also download h2o-genmodel.jar and store it in either in the same folder

 genmodel_name Custom name of genmodel jar.

 genmodel_path Path to store h2o-genmodel.jar. If left blank and “get_genmodel_jar“ is TRUE, then the h2o-genmodel.jar

Value

Name of the MOJO file written to the path.

Examples

## Not run:
library(h2o)
h <- h2o.init()
fr <- as.h2o(iris)
my_model <- h2o.gbm(x = 1:4, y = 5, training_frame = fr)
h2o.download_mojo(my_model) # save to the current working directory

## End(Not run)

h2o.download_pojo Download the Scoring POJO (Plain Old Java Object) of an H2O Model

Description

Download the Scoring POJO (Plain Old Java Object) of an H2O Model

Usage

h2o.download_pojo(
  model,
  path = NULL,
  getjar = NULL,
  get_jar = TRUE,
  jar_name = ""
)
h2o.drop_duplicates

**Arguments**

- **model**: An H2OModel
- **path**: The path to the directory to store the POJO (no trailing slash). If NULL, then print to to console. The file name will be a compilable java file name.
- **getjar**: (DEPRECATED) Whether to also download the h2o-genmodel.jar file needed to compile the POJO. This argument is now called ‘get_jar’.
- **get_jar**: Whether to also download the h2o-genmodel.jar file needed to compile the POJO
- **jar_name**: Custom name of genmodel jar.

**Value**

If path is NULL, then pretty print the POJO to the console. Otherwise save it to the specified directory and return POJO file name.

**Examples**

```r
## Not run:
library(h2o)
h <- h2o.init()
fr <- as.h2o(iris)
my_model <- h2o.gbm(x = 1:4, y = 5, training_frame = fr)

h2o.download_pojo(my_model) # print the model to screen
# h2o.download_pojo(my_model, getwd()) # save the POJO and jar file to the current working directory, NOT RUN
# h2o.download_pojo(my_model, getwd(), get_jar = FALSE ) # save only the POJO to the current working directory, NOT RUN
h2o.download_pojo(my_model, getwd()) # save to the current working directory
## End(Not run)
```

h2o.drop_duplicates **Drops duplicated rows.**

**Description**

Drops duplicated rows across specified columns.

**Usage**

```r
h2o.drop_duplicates(frame, columns, keep = "first")
```

**Arguments**

- **frame**: An H2OFrame object to drop duplicates on.
- **columns**: Columns to compare during the duplicate detection process.
- **keep**: Which rows to keep. The “first” value (default) keeps the first row and deletes the rest. The “last” keeps the last row.
Examples

```r
## Not run:
library(h2o)
h2o.init()

data <- as.h2o(iris)
deduplicated_data <- h2o.drop_duplicates(data, c("Species", "Sepal.Length"), keep = "first")

## End(Not run)
```

---

**h2o.entropy**

*Shannon entropy*

**Description**

Return the Shannon entropy of a string column. If the string is empty, the entropy is 0.

**Usage**

`h2o.entropy(x)`

**Arguments**

- `x` The column on which to calculate the entropy.

**Examples**

```r
## Not run:
library(h2o)
h2o.init()

buys <- as.h2o(c("no", "no", "yes", "yes", "no", "yes", "no", "yes", "yes", "no"))
buys_entropy <- h2o.entropy(buys)

## End(Not run)
```

---

**h2o.exp**

*Compute the exponential function of x*

**Description**

Compute the exponential function of x

**Usage**

`h2o.exp(x)`
h2o.explain

Generate Model Explanations

Description
The H2O Explainability Interface is a convenient wrapper to a number of explainability methods and visualizations in H2O. The function can be applied to a single model or group of models and returns a list of explanations, which are individual units of explanation such as a partial dependence plot or a variable importance plot. Most of the explanations are visual (ggplot plots). These plots can also be created by individual utility functions as well.

Usage
h2o.explain(
  object,
  newdata,
  columns = NULL,
  top_n_features = 5,
  include_explanations = "ALL",
  exclude_explanations = NULL,
  plot_overrides = NULL
)

Arguments
x
  An H2OFrame object.

See Also
Log for the base R implementation, exp().

Examples
## Not run:
library(h2o)
h2o.init()

frame <- h2o.createFrame(rows = 6, cols = 2,
categorical_fraction = 0.0,
missing_fraction = 0.7,
seed = 123)
h2o.exp(frame["C1"])
## End(Not run)
Arguments

object: One of the following: an H2O model, a list of H2O models, an H2OAutoML object or an H2OAutoML Leaderboard slice.

newdata: An H2OFrame.

columns: A vector of column names or column indices to create plots with. If specified parameter top_n_features will be ignored.

top_n_features: An integer specifying the number of columns to use, ranked by variable importance (where applicable).

include_explanations: If specified, return only the specified model explanations. (Mutually exclusive with exclude_explanations)

exclude_explanations: Exclude specified model explanations.

plot_overrides: Overrides for individual model explanations, e.g. list(shap_summary_plot = list(columns = 50)).

Value

List of outputs with class "H2OExplanation"

Examples

```r
## Not run:
library(h2o)
h2o.init()

# Import the wine dataset into H2O:
df <- h2o.importFile(f)

# Set the response
response <- "quality"

# Split the dataset into a train and test set:
splits <- h2o.splitFrame(df, ratios = 0.8, seed = 1)
train <- splits[[1]]
test <- splits[[2]]

# Build and train the model:
aml <- h2o.automl(y = response,
training_frame = train,
max_models = 10,
seed = 1)

# Create the explanation for whole H2OAutoML object
exa <- h2o.explain(aml, test)
print(exa)

# Create the explanation for the leader model
```
h2o.explain_row

```r
exm <- h2o.explain(aml@leader, test)
print(exm)

## End(Not run)
```

---

**h2o.explain_row**

*Generate Model Explanations for a single row*

**Description**

Explain the behavior of a model or group of models with respect to a single row of data. The function returns a list of explanations, which are individual units of explanation such as a partial dependence plot or a variable importance plot. Most of the explanations are visual (ggplot plots). These plots can also be created by individual utility functions as well.

**Usage**

```r
h2o.explain_row(
  object,
  newdata,
  row_index,
  columns = NULL,
  top_n_features = 5,
  include_explanations = "ALL",
  exclude_explanations = NULL,
  plot_overrides = NULL
)
```

**Arguments**

- **object** One of the following: an H2O model, a list of H2O models, an H2OAutoML object or an H2OAutoML Leaderboard slice.
- **newdata** An H2OFrame.
- **row_index** A row index of the instance to explain.
- **columns** A vector of column names or column indices to create plots with. If specified parameter top_n_features will be ignored.
- **top_n_features** An integer specifying the number of columns to use, ranked by variable importance (where applicable).
- **include_explanations** If specified, return only the specified model explanations. (Mutually exclusive with exclude_explanations)
- **exclude_explanations** Exclude specified model explanations.
- **plot_overrides** Overrides for individual model explanations, e.g., `list(shap_explain_row = list(columns = 5))`
Value

List of outputs with class "H2OExplanation"

Examples

```r
## Not run:
library(h2o)

# Import the wine dataset into H2O:
df <- h2o.importFile(f)

# Set the response
response <- "quality"

# Split the dataset into a train and test set:
splits <- h2o.splitFrame(df, ratios = 0.8, seed = 1)
train <- splits[[1]]
test <- splits[[2]]

# Build and train the model:
aml <- h2o.automl(y = response,
                   training_frame = train,
                   max_models = 10,
                   seed = 1)

# Create the explanation for whole H2OAutoML object
exa <- h2o.explain_row(aml, test, row_index = 1)
print(exa)

# Create the explanation for the leader model
exm <- h2o.explain_row(aml@leader, test, row_index = 1)
print(exm)

## End(Not run)
```

---

**h2o.exportFile**

*Export an H2O Data Frame (H2OFrame) to a File or to a collection of Files.*

**Description**

Exports an H2OFrame (which can be either VA or FV) to a file. This file may be on the H2O instance's local filesystem, or to HDFS (preface the path with hdfs://) or to S3N (preface the path with s3n://).
Usage

h2o.exportFile(
  data,
  path,
  force = FALSE,
  sep = ",",
  compression = NULL,
  parts = 1,
  header = TRUE,
  quote_header = TRUE
)

Arguments

data An H2OFrame object.

path The path to write the file to. Must include the directory and also filename if exporting to a single file. May be prefaced with hdfs:// or s3n://. Each row of data appears as line of the file.

force logical, indicates how to deal with files that already exist.

sep The field separator character. Values on each line of the file will be separated by this character (default ",").

compression How to compress the exported dataset (default none; gzip, bzip2 and snappy available)

parts integer, number of part files to export to. Default is to write to a single file. Large data can be exported to multiple 'part' files, where each part file contains subset of the data. User can specify the maximum number of part files or use value -1 to indicate that H2O should itself determine the optimal number of files. Parameter path will be considered to be a path to a directory if export to multiple part files is desired. Part files conform to naming scheme 'part-m-?????'.

header logical, indicates whether to write the header line. Default is to include the header in the output file.

quote_header logical, indicates whether column names should be quoted. Default is to use quotes.

Details

In the case of existing files force = TRUE will overwrite the file. Otherwise, the operation will fail.

Examples

## Not run:
library(h2o)
h2o.init()
iris_hf <- as.h2o(iris)

# These aren't real paths
# h2o.exportFile(iris_hf, path = "/path/on/h2o/server/filesystem/iris.csv")
h2o.feature_interaction

### Description

Feature interactions and importance, leaf statistics and split value histograms in a tabular form. Available for XGBoost and GBM.

### Metrics

- **Gain** - Total gain of each feature or feature interaction.
- **FScore** - Amount of possible splits taken on a feature or feature interaction.
- **wFScore** - Amount of possible splits taken on a feature or feature interaction weighed by the probability of the splits to take place.
- **Average wFScore** - wFScore divided by FScore.
- **Average Gain** - Gain divided by FScore.
- **Expected Gain** - Total gain of each feature or feature interaction weighed by the probability to gather the gain.
- **Average Tree Index**
- **Average Tree Depth**

---

h2o.exportHDFS

*Export a Model to HDFS*

### Description

Exports an **H2OModel** to HDFS.

### Usage

```r
h2o.exportHDFS(object, path, force = FALSE)
```

### Arguments

- **object** - an **H2OModel** class object.
- **path** - The path to write the model to. Must include the directory and filename.
- **force** - logical, indicates how to deal with files that already exist.

### Examples

```r
## Not run:
library(h2o)
h2o.init
train <- h2o.importFile(f)
h2o.exportHDFS(train, path = "", force = FALSE)
## End(Not run)
```
Usage

```r
h2o.feature_interaction(
    model, 
    max_interaction_depth = 100, 
    max_tree_depth = 100, 
    max_deepening = -1
)
```

Arguments

- `model` A trained xgboost model.
- `max_interaction_depth` Upper bound for extracted feature interactions depth. Defaults to 100.
- `max_tree_depth` Upper bound for tree depth. Defaults to 100.
- `max_deepening` Upper bound for interaction start deepening (zero deepening => interactions starting at root only). Defaults to -1.

Examples

```r
## Not run:
library(h2o)
h2o.init()
boston <- h2o.importFile(
    destination_frame="boston"
)
boston_xgb <- h2o.xgboost(training_frame = boston, y = "medv", seed = 1234)
feature_interactions <- h2o.feature_interaction(boston_xgb)
## End(Not run)
```

---

**h2o.fillna**

**fillNA**

Description

Fill NA's in a sequential manner up to a specified limit

Usage

```r
h2o.fillna(x, method = "forward", axis = 1, maxlen = 1L)
```

Arguments

- `x` an H2OFrame
- `method` A String: "forward" or "backward"
- `axis` An Integer 1 for row-wise fill (default), 2 for column-wise fill
- `maxlen` An Integer for maximum number of consecutive NA's to fill
Value

An H2OFrame after filling missing values

Examples

```r
## Not run:
library(h2o)
h2o.init()

frame_with_nas <- h2o.createFrame(rows = 6, cols = 2,
                                 categorical_fraction = 0.0,
                                 missing_fraction = 0.7,
                                 seed = 123)
frame <- h2o.fillna(frame_with_nas, "forward", axis = 1, maxlen = 2L)

## End(Not run)
```

---

**h2o.filterNACols**

*Filter NA Columns*

**Description**

Filter NA Columns

**Usage**

```r
h2o.filterNACols(data, frac = 0.2)
```

**Arguments**

- `data` A dataset to filter on.
- `frac` The threshold of NAs to allow per column (columns >= this threshold are filtered)

**Value**

Returns a numeric vector of indexes that pertain to non-NA columns

**Examples**

```r
## Not run:
library(h2o)
h2o.init()

frame <- h2o.createFrame(rows = 6, cols = 2,
                          categorical_fraction = 0.0,
                          missing_fraction = 0.7,
                          seed = 123)

h2o.filterNACols(frame, frac = 0.5)
```
h2o.findSynonyms

Find synonyms using a word2vec model.

Description

Find synonyms using a word2vec model.

Usage

h2o.findSynonyms(word2vec, word, count = 20)

Arguments

word2vec A word2vec model.
word A single word to find synonyms for.
count The top 'count' synonyms will be returned.

Examples

## Not run:
library(h2o)
h2o.init()

        col.names = c("category", "jobtitle"), col.types = c("String", "String"), header = TRUE )

words <- h2o.tokenize(job_titles, " ")
vec <- h2o.word2vec(training_frame = words)
h2o.findSynonyms(vec, "teacher", count = 20)

## End(Not run)

h2o.find_row_by_threshold

Find the threshold, give the max metric. No duplicate thresholds allowed

Description

Find the threshold, give the max metric. No duplicate thresholds allowed
h2o.find_row_by_threshold

Usage

h2o.find_row_by_threshold(object, threshold)

Arguments

object H2OBinomialMetrics
threshold number between 0 and 1

Examples

## Not run:
library(h2o)
h2o.init()

cars <- h2o.importFile(f)
cars["economy_20mpg"] <- as.factor(cars["economy_20mpg"])
predictors <- c("displacement", "power", "weight", "acceleration", "year")
response <- "economy_20mpg"
cars_split <- h2o.splitFrame(data = cars, ratios = 0.8, seed = 1234)
train <- cars_split[[1]]
valid <- cars_split[[2]]
cars_gbm <- h2o.gbm(x = predictors, y = response,
training_frame = train, validation_frame = valid,
build_tree_one_node = TRUE, seed = 1234)
perf <- h2o.performance(cars_gbm, cars)
h2o.find_row_by_threshold(perf, 0.5)

## End(Not run)

h2o.find_threshold_by_max_metric

Find the threshold, give the max metric

Description

Find the threshold, give the max metric

Usage

h2o.find_threshold_by_max_metric(object, metric)

Arguments

object H2OBinomialMetrics
metric "F1," for example
Examples

```r
## Not run:
library(h2o)
h2o.init()

cars <- h2o.importFile(f)
cars["economy_20mpg"] <- as.factor(cars["economy_20mpg"])
predictors <- c("displacement", "power", "weight", "acceleration", "year")
response <- "economy_20mpg"
cars_split <- h2o.splitFrame(data = cars, ratios = 0.8, seed = 1234)
train <- cars_split[[1]]
valid <- cars_split[[2]]
cars_gbm <- h2o.gbm(x = predictors, y = response,
  training_frame = train, validation_frame = valid,
  build_tree_one_node = TRUE, seed = 1234)
perf <- h2o.performance(cars_gbm, cars)
h2o.find_threshold_by_max_metric(perf, "fnr")

## End(Not run)
```

h2o.floor

Take a single numeric argument and return a numeric vector with the largest integers

Description

floor takes a single numeric argument x and returns a numeric vector containing the largest integers not greater than the corresponding elements of x.

Usage

```r
h2o.floor(x)
```

Arguments

- **x**: An H2OFrame object.

See Also

- `Round` for the base R implementation, `floor()`.

Examples

```r
## Not run:
library(h2o)
h2o.init()

frame <- h2o.createFrame(rows = 6, cols = 2,
```
h2o.gainsLift
categorical_fraction = 0.0,
missing_fraction = 0.7,
seed = 123)

h2o.floor(frame["C2"])

## End(Not run)

h2o.flow

**Open H2O Flow**

**Description**
Open H2O Flow in your browser

**Usage**

h2o.flow()

h2o.gainsLift

**Access H2O Gains/Lift Tables**

**Description**
Retrieve either a single or many Gains/Lift tables from H2O objects.

**Usage**

h2o.gainsLift(object, ...)

## S4 method for signature 'H2OModel'
h2o.gainsLift(object, newdata, valid = FALSE, xval = FALSE, ...)

## S4 method for signature 'H2OModelMetrics'
h2o.gainsLift(object)

**Arguments**

<table>
<thead>
<tr>
<th>object</th>
<th>Either an H2OModel object or an H2OModelMetrics object.</th>
</tr>
</thead>
<tbody>
<tr>
<td>...</td>
<td>further arguments to be passed to/from this method.</td>
</tr>
<tr>
<td>newdata</td>
<td>An H2OFrame object that can be scored on. Requires a valid response column.</td>
</tr>
<tr>
<td>valid</td>
<td>Retrieve the validation metric.</td>
</tr>
<tr>
<td>xval</td>
<td>Retrieve the cross-validation metric.</td>
</tr>
</tbody>
</table>

**Details**
The H2OModelMetrics version of this function will only take H2OBinomialMetrics objects.
Value

Calling this function on H2OModel objects returns a Gains/Lift table corresponding to the predict function.

See Also

predict for generating prediction frames, h2o.performance for creating H2OModelMetrics.

Examples

## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(prostate_path)
prostate[, 2] <- as.factor(prostate[, 2])
model <- h2o.gbm(x = 3:9, y = 2, distribution = "bernoulli",
                 training_frame = prostate, validation_frame = prostate, nfolds = 3)
h2o.gainsLift(model) ## extract training metrics
h2o.gainsLift(model, valid = TRUE) ## extract validation metrics (here: the same)
h2o.gainsLift(model, xval = TRUE) ## extract cross-validation metrics
h2o.gainsLift(model, newdata = prostate) ## score on new data (here: the same)
# Generating a ModelMetrics object
perf <- h2o.performance(model, prostate)
h2o.gainsLift(perf) ## extract from existing metrics object

## End(Not run)

---

**h2o.gam**

### Fit a General Additive Model

**Description**

Creates a generalized additive model, specified by a response variable, a set of predictors, and a description of the error distribution.

**Usage**

h2o.gam(
  x,
  y,
  training_frame,
  gam_columns,

             "WEIGHTED_OVO")
)

Arguments

x  (Optional) A vector containing the names or indices of the predictor variables to use in building the model. If x is missing, then all columns except y are used.
y  The name or column index of the response variable in the data. The response must be either a numeric or a categorical/factor variable. If the response is numeric, then a regression model will be trained, otherwise it will train a classification model.
training_frame  Id of the training data frame.
gam_columns  Arrays of predictor column names for gam for smoothers using single or multiple predictors like 'c1','c2','c3','c4',...
model_id  Destination id for this model; auto-generated if not specified.
validation_frame  Id of the validation data frame.
nfolds  Number of folds for K-fold cross-validation (0 to disable or >= 2). Defaults to 0.
seed  Seed for random numbers (affects certain parts of the algo that are stochastic and those might or might not be enabled by default). Defaults to -1 (time-based random number).
keep_cross_validation_models  Logical. Whether to keep the cross-validation models. Defaults to TRUE.
keep_cross_validation_predictions  Logical. Whether to keep the predictions of the cross-validation models. Defaults to FALSE.
keep_cross_validation_fold_assignment  Logical. Whether to keep the cross-validation fold assignment. Defaults to FALSE.
fold_assignment  Cross-validation fold assignment scheme, if fold_column is not specified. The 'Stratified' option will stratify the folds based on the response variable, for classification problems. Must be one of: "AUTO", "Random", "Modulo", "Stratified". Defaults to AUTO.
fold_column  Column with cross-validation fold index assignment per observation.
ignore_const_cols  Logical. Ignore constant columns. Defaults to TRUE.
score_each_iteration  Logical. Whether to score during each iteration of model training. Defaults to FALSE.
offset_column  Offset column. This will be added to the combination of columns before applying the link function.
weights_column  Column with observation weights. Giving some observation a weight of zero is equivalent to excluding it from the dataset; giving an observation a relative weight of 2 is equivalent to repeating that row twice. Negative weights are not allowed. Note: Weights are per-row observation weights and do not increase the size of the data frame. This is typically the number of times a row is repeated, but non-integer values are supported as well. During training, rows with higher weights matter more, due to the larger loss function pre-factor.
family  Family. Use binomial for classification with logistic regression, others are for regression problems. Must be one of: "AUTO", "gaussian", "binomial", "quasibinomial", "ordinal", "multinomial", "poisson", "gamma", "tweedie", "negativebinomial", "fractionalbinomial". Defaults to AUTO.
tweedie_variance_power  Tweedie variance power Defaults to 0.
tweedie_link_power  Tweedie link power Defaults to 0.
theta  Theta Defaults to 0.
solver  AUTO will set the solver based on given data and the other parameters. IRLSM is fast on on problems with small number of predictors and for lambda-search with L1 penalty. L_BFGS scales better for datasets with many columns. Must be one of: "AUTO", "IRLSM", "L_BFGS", "COORDINATE_DESCENT_NAIVE", "COORDINATE_DESCENT", "GRADIENT_DESCENT_LH", "GRADIENT_DESCENT_SQERR". Defaults to AUTO.
alpha  Distribution of regularization between the L1 (Lasso) and L2 (Ridge) penalties. A value of 1 for alpha represents Lasso regression, a value of 0 produces Ridge regression, and anything in between specifies the amount of mixing between the two. Default value of alpha is 0 when SOLVER = 'L-BFGS'; 0.5 otherwise.
lambda  Regularization strength
lambda_search  Logical. Use lambda search starting at lambda max, given lambda is then interpreted as lambda min Defaults to FALSE.
early_stopping  Logical. Stop early when there is no more relative improvement on train or validation (if provided) Defaults to TRUE.
nlambdas  Number of lambdas to be used in a search. Default indicates: If alpha is zero, with lambda search set to True, the value of nlamdas is set to 30 (fewer lambdas are needed for ridge regression) otherwise it is set to 100. Defaults to -1.
standardize  Logical. Standardize numeric columns to have zero mean and unit variance Defaults to FALSE.
missing_values_handling
Handling of missing values. Either MeanImputation, Skip or PlugValues. Must be one of: "MeanImputation", "Skip", "PlugValues". Defaults to MeanImputation.

plug_values
Plug Values (a single row frame containing values that will be used to impute missing values of the training/validation frame, use with conjunction missing_values_handling = PlugValues)

compute_p_values
Logical. Request p-values computation, p-values work only with IRLSM solver and no regularization Defaults to FALSE.

remove_collinear_columns
Logical. In case of linearly dependent columns, remove some of the dependent columns Defaults to FALSE.

intercept Logical. Include constant term in the model Defaults to TRUE.

non_negative Logical. Restrict coefficients (not intercept) to be non-negative Defaults to FALSE.

max_iterations
Maximum number of iterations Default to -1.

objective_epsilon
Converge if objective value changes less than this. Default indicates: If lambda_search is set to True the value of objective_epsilon is set to .0001. If the lambda_search is set to False and lambda is equal to zero, the value of objective_epsilon is set to .000001, for any other value of lambda the default value of objective_epsilon is set to .0001. Defaults to -1.

beta_epsilon
Converge if beta changes less (using L-infinity norm) than beta epsilon, ONLY applies to IRLSM solver Defaults to 0.0001.

gradient_epsilon
Converge if objective changes less (using L-infinity norm) than this, ONLY applies to L-BFGS solver. Default indicates: If lambda_search is set to False and lambda is equal to zero, the default value of gradient_epsilon is equal to .000001, otherwise the default value is .0001. If lambda_search is set to True, the conditional values above are 1E-8 and 1E-6 respectively. Defaults to -1.

link

startval
double array to initialize coefficients for GAM.

prior
Prior probability for y==1. To be used only for logistic regression iff the data has been sampled and the mean of response does not reflect reality. Defaults to -1.

cold_start
Logical. Only applicable to multiple alpha/lambda values when calling GLM from GAM. If false, build the next model for next set of alpha/lambda values starting from the values provided by current model. If true will start GLM model from scratch. Defaults to FALSE.

lambda_min_ratio
Minimum lambda used in lambda search, specified as a ratio of lambda_max (the smallest lambda that drives all coefficients to zero). Default indicates: if the number of observations is greater than the number of variables, then lambda_min_ratio is set to 0.0001; if the number of observations is less than the number of variables, then lambda_min_ratio is set to 0.01. Defaults to -1.
beta_constraints
Beta constraints

max_active_predictors
Maximum number of active predictors during computation. Use as a stopping criterion to prevent expensive model building with many predictors. Default indicates: If the IRLSM solver is used, the value of max_active_predictors is set to 5000 otherwise it is set to 10000000. Defaults to -1.

interactions
A list of predictor column indices to interact. All pairwise combinations will be computed for the list.

interaction_pairs
A list of pairwise (first order) column interactions.

obj_reg
Likelihood divider in objective value computation, default is 1/nobs Defaults to -1.

export_checkpoints_dir
Automatically export generated models to this directory.

stopping_rounds
Early stopping based on convergence of stopping_metric. Stop if simple moving average of length k of the stopping_metric does not improve for k:=stopping_rounds scoring events (0 to disable) Defaults to 0.

stopping_metric
Metric to use for early stopping (AUTO: logloss for classification, deviance for regression and anomaly_score for Isolation Forest). Note that custom and custom_increasing can only be used in GBM and DRF with the Python client. Must be one of: "AUTO", "deviance", "logloss", "MSE", "RMSE", "MAE", "RMSLE", "AUC", "AUCPR", "lift_top_group", "misclassification", "mean_per_class_error", "custom", "custom_increasing". Defaults to AUTO.

stopping_tolerance
Relative tolerance for metric-based stopping criterion (stop if relative improvement is not at least this much) Defaults to 0.001.

balance_classes
Logical. Balance training data class counts via over/under-sampling (for imbalanced data). Defaults to FALSE.

class_sampling_factors
Desired over/under-sampling ratios per class (in lexicographic order). If not specified, sampling factors will be automatically computed to obtain class balance during training. Requires balance_classes.

max_after_balance_size
Maximum relative size of the training data after balancing class counts (can be less than 1.0). Requires balance_classes. Defaults to 5.0.

max_runtime_secs
Maximum allowed runtime in seconds for model training. Use 0 to disable. Defaults to 0.

custom_metric_func
Reference to custom evaluation function, format: ‘language:keyName=funcName’

num_knots
Number of knots for gam predictors
knot_ids: String arrays storing frame keys of knots. One for each gam column set specified in gam_columns.

standardize_tp_gam_cols: Logical. Standardize tp (thin plate) predictor columns. Defaults to FALSE.

scale_tp_penalty_mat: Logical. Scale penalty matrix for tp (thin plate) smoothers as in R. Defaults to FALSE.

bs: Basis function type for each gam predictors. 0 for cr, 1 for thin plate regression with knots, 2 for thin plate regression with SVD. If specified, must be the same size as gam_columns.

scale: Smoothing parameter for gam predictors. If specified, must be of the same length as gam_columns.

keep_gam_cols: Logical. Save keys of model matrix. Defaults to FALSE.

auc_type: Set default multinomial AUC type. Must be one of: "AUTO", "NONE", "MACRO_OVR", "WEIGHTED_OVR", "MACRO_OVO", "WEIGHTED_OVO". Defaults to AUTO.

Examples

```r
## Not run:
h2o.init()

# Run GAM of CAPSULE ~ AGE + RACE + PSA + DCAPS
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
prostate$CAPSULE <- as.factor(prostate$CAPSULE)
h2o.gam(y = "CAPSULE", x = c("RACE"), gam_columns = c("PSA"),
        training_frame = prostate, family = "binomial")

## End(Not run)
```

Build gradient boosted classification or regression trees

Description

Builds gradient boosted classification trees and gradient boosted regression trees on a parsed data set. The default distribution function will guess the model type based on the response column type. In order to run properly, the response column must be numeric for "gaussian" or an enum for "bernoulli" or "multinomial".

Usage

```r
h2o.gbm(
  x,
  y,
```
training_frame,

  "WEIGHTED_OVO"),
verbose = FALSE
)

Arguments

x (Optional) A vector containing the names or indices of the predictor variables to use in building the model. If x is missing, then all columns except y are used.

y The name or column index of the response variable in the data. The response must be either a numeric or a categorical/factor variable. If the response is numeric, then a regression model will be trained, otherwise it will train a classification model.

training_frame Id of the training data frame.
model_id Destination id for this model; auto-generated if not specified.
validation_frame Id of the validation data frame.
nfolds Number of folds for K-fold cross-validation (0 to disable or >= 2). Defaults to 0.
keep_cross_validation_models Logical. Whether to keep the cross-validation models. Defaults to TRUE.
keep_cross_validation_predictions Logical. Whether to keep the predictions of the cross-validation models. Defaults to FALSE.
keep_cross_validation_fold_assignment Logical. Whether to keep the cross-validation fold assignment. Defaults to FALSE.
score_each_iteration Logical. Whether to score during each iteration of model training. Defaults to FALSE.
score_tree_interval Score the model after every so many trees. Disabled if set to 0. Defaults to 0.
fold_assignment Cross-validation fold assignment scheme, if fold_column is not specified. The 'Stratified' option will stratify the folds based on the response variable, for clas-
fold_column Column with cross-validation fold index assignment per observation.
ignore_const_cols Logical. Ignore constant columns. Defaults to TRUE.
offset_column Offset column. This will be added to the combination of columns before applying the link function.
weights_column Column with observation weights. Giving some observation a weight of zero is equivalent to excluding it from the dataset; giving an observation a relative weight of 2 is equivalent to repeating that row twice. Negative weights are not allowed. Note: Weights are per-row observation weights and do not increase the size of the data frame. This is typically the number of times a row is repeated, but non-integer values are supported as well. During training, rows with higher weights matter more, due to the larger loss function pre-factor.
balance_classes Logical. Balance training data class counts via over/under-sampling (for imbalanced data). Defaults to FALSE.
class_sampling_factors Desired over/under-sampling ratios per class (in lexicographic order). If not specified, sampling factors will be automatically computed to obtain class balance during training. Requires balance_classes.
max_after_balance_size Maximum relative size of the training data after balancing class counts (can be less than 1.0). Requires balance_classes. Defaults to 5.0.
ntrees Number of trees. Defaults to 50.
max_depth Maximum tree depth (0 for unlimited). Defaults to 5.
min_rows Fewest allowed (weighted) observations in a leaf. Defaults to 10.
bins For numerical columns (real/int), build a histogram of (at least) this many bins, then split at the best point Defaults to 20.
bins_top_level For numerical columns (real/int), build a histogram of (at most) this many bins at the root level, then decrease by factor of two per level Defaults to 1024.
bins过程当中 For categorical columns (factors), build a histogram of this many bins, then split at the best point. Higher values can lead to more overfitting. Defaults to 1024.
r2_stopping r2_stopping is no longer supported and will be ignored if set - please use stopping_rounds, stopping_metric and stopping_tolerance instead. Previous version of H2O would stop making trees when the R^2 metric equals or exceeds this Defaults to 1.797693135e+308.
stopping_rounds Early stopping based on convergence of stopping_metric. Stop if simple moving average of length k of the stopping_metric does not improve for k:=stopping_rounds scoring events (0 to disable) Defaults to 0.
stopping_metric Metric to use for early stopping (AUTO: logloss for classification, deviance for regression and anomoly_score for Isolation Forest). Note that custom
and custom_increasing can only be used in GBM and DRF with the Python client. Must be one of: "AUTO", "deviance", "logloss", "MSE", "RMSE", "MAE", "RMSLE", "AUC", "AUCPR", "lift_top_group", "misclassification", "mean_per_class_error", "custom", "custom_increasing". Defaults to AUTO.

**stopping_tolerance**
Relative tolerance for metric-based stopping criterion (stop if relative improvement is not at least this much) Defaults to 0.001.

**max_runtime_secs**
Maximum allowed runtime in seconds for model training. Use 0 to disable. Defaults to 0.

**seed**
Seed for random numbers (affects certain parts of the algo that are stochastic and those might or might not be enabled by default). Defaults to -1 (time-based random number).

**build_tree_one_node**
Logical. Run on one node only; no network overhead but fewer cpus used. Suitable for small datasets. Defaults to FALSE.

**learn_rate**
Learning rate (from 0.0 to 1.0) Defaults to 0.1.

**learn_rate_annealing**
Scale the learning rate by this factor after each tree (e.g., 0.99 or 0.999) Defaults to 1.

**distribution**
Distribution function Must be one of: "AUTO", "bernoulli", "quasibinomial", "multinomial", "gaussian", "poisson", "gamma", "tweedie", "laplace", "quantile", "huber", "custom". Defaults to AUTO.

**quantile_alpha**
Desired quantile for Quantile regression, must be between 0 and 1. Defaults to 0.5.

**tweedie_power**
Tweedie power for Tweedie regression, must be between 1 and 2. Defaults to 1.5.

**huber_alpha**
Desired quantile for Huber/M-regression (threshold between quadratic and linear loss, must be between 0 and 1). Defaults to 0.9.

**checkpoint**
Model checkpoint to resume training with.

**sample_rate**
Row sample rate per tree (from 0.0 to 1.0) Defaults to 1.

**sample_rate_per_class**
A list of row sample rates per class (relative fraction for each class, from 0.0 to 1.0), for each tree

**col_sample_rate**
Column sample rate (from 0.0 to 1.0) Defaults to 1.

**col_sample_rate_change_per_level**
Relative change of the column sampling rate for every level (must be > 0.0 and <= 2.0) Defaults to 1.

**col_sample_rate_per_tree**
Column sample rate per tree (from 0.0 to 1.0) Defaults to 1.

**min_split_improvement**
Minimum relative improvement in squared error reduction for a split to happen Defaults to 1e-05.
histogram_type  What type of histogram to use for finding optimal split points Must be one of: "AUTO", "UniformAdaptive", "Random", "QuantilesGlobal", "RoundRobin". Defaults to AUTO.

max_abs_leafnode_pred  Maximum absolute value of a leaf node prediction Defaults to 1.797693135e+308.

pred_noise_bandwidth  Bandwidth (sigma) of Gaussian multiplicative noise ~N(1,sigma) for tree node predictions Defaults to 0.

categorical_encoding  Encoding scheme for categorical features Must be one of: "AUTO", "Enum", "OneHotInternal", "OneHotExplicit", "Binary", "Eigen", "LabelEncoder", "Sort-ByResponse", "EnumLimited". Defaults to AUTO.

calibrate_model  Logical. Use Platt Scaling to calculate calibrated class probabilities. Calibration can provide more accurate estimates of class probabilities. Defaults to FALSE.

calibration_frame  Calibration frame for Platt Scaling

custom_metric_func  Reference to custom evaluation function, format: ‘language:keyName=funcName’

custom_distribution_func  Reference to custom distribution, format: ‘language:keyName=funcName’

export_checkpoints_dir  Automatically export generated models to this directory.

monotone_constraints  A mapping representing monotonic constraints. Use +1 to enforce an increasing constraint and -1 to specify a decreasing constraint.

check_constant_response  Logical. Check if response column is constant. If enabled, then an exception is thrown if the response column is a constant value. If disabled, then model will train regardless of the response column being a constant value or not. Defaults to TRUE.

Gainslift_bins  Gains/Lift table number of bins. 0 means disabled.. Default value -1 means automatic binning. Defaults to -1.

auc_type  Set default multinomial AUC type. Must be one of: "AUTO", "NONE", "MACRO_OVR", "WEIGHTED_OVR", "MACRO_OVO", "WEIGHTED_OVO". Defaults to AUTO.

verbose  Logical. Print scoring history to the console (Metrics per tree). Defaults to FALSE.

Examples

## Not run:
library(h2o)
h2o.init()

# Run regression GBM on australia data
australia_path <- system.file("extdata", "australia.csv", package = "h2o")
australia <- h2o.uploadFile(path = australia_path)
independent <- c("premax", "salmax", "minairtemp", "maxairtemp", "maxsst",
"maxsoilmoist", "Max_czcs")
dependent <- "runoffnew"

h2o.gbm(y = dependent, x = independent, training_frame = australia,
        ntrees = 3, max_depth = 3, min_rows = 2)

## End(Not run)

---

**h2o.generic**  
*Imports a generic model into H2O. Such model can be used then used for scoring and obtaining additional information about the model. The imported model has to be supported by H2O.*

**Description**  
Imports a generic model into H2O. Such model can be used then used for scoring and obtaining additional information about the model. The imported model has to be supported by H2O.

**Usage**  
`h2o.generic(model_id = NULL, model_key = NULL, path = NULL)`

**Arguments**  
- `model_id`: Destination id for this model; auto-generated if not specified.
- `model_key`: Key to the self-contained model archive already uploaded to H2O.
- `path`: Path to file with self-contained model archive.

**Examples**  
## Not run:
# library(h2o)
# h2o.init()

# generic_model <- h2o.genericModel("/path/to/model.zip")
# predictions <- h2o.predict(generic_model, dataset)

## End(Not run)
h2o.genericModel

Imports a model under given path, creating a Generic model with it.

Description

Usage example: generic_model <- h2o.genericModel(model_file_path = "/path/to/mojo.zip") predictions <- h2o.predict(generic_model, dataset)

Usage

h2o.genericModel(mojo_file_path)

Arguments

mojo_file_path  Filesystem path to the model imported

Value

Returns H2O Generic Model based on given embedded model

Examples

## Not run:

# Import default Iris dataset as H2O frame
data <- as.h2o(iris)

# Train a very simple GBM model
original_model <- h2o.gbm(x = features, y = "Species", training_frame = data)

# Download the trained GBM model as MOJO (temporary directory used in this example)
mojo_original_name <- h2o.download_mojo(model = original_model, path = tempdir())
mojo_original_path <- paste0(tempdir(), "/", mojo_original_name)

# Import the MOJO as Generic model
generic_model <- h2o.genericModel(mojo_original_path)

# Perform scoring with the generic model
generic_model_predictions <- h2o.predict(generic_model, data)

## End(Not run)
h2o.getAlphaBest

Extract best alpha value found from glm model.

Description
This function allows setting betas of an existing glm model.

Usage
h2o.getAlphaBest(model)

Arguments
model an H2OModel corresponding from a h2o.glm call.

h2o.getConnection

Retrieve an H2O Connection

Description
Attempt to recover an h2o connection.

Usage
h2o.getConnection()

Value
Returns an H2OConnection object.

h2o.getFrame

Get an R Reference to an H2O Dataset, that will NOT be GC’d by default

Description
Get the reference to a frame with the given id in the H2O instance.

Usage
h2o.getFrame(id)

Arguments
id A string indicating the unique frame of the dataset to retrieve.
Examples

```r
## Not run:
library(h2o)
h2o.init()

train <- h2o.importFile(f)
y <- "species"
x <- setdiff(names(train), y)
train[, y] <- as.factor(train[, y])
nfolds <- 5
num_base_models <- 2
my_gbm <- h2o.gbm(x = x, y = y, training_frame = train,
                 distribution = "multinomial", ntrees = 10,
                 max_depth = 3, min_rows = 2, learn_rate = 0.2,
                 nfolds = nfolds, fold_assignment = "Modulo",
                 keep_cross_validation_predictions = TRUE, seed = 1)
my_rf <- h2o.randomForest(x = x, y = y, training_frame = train,
                          ntrees = 50, nfolds = nfolds, fold_assignment = "Modulo",
                          keep_cross_validation_predictions = TRUE, seed = 1)
stack <- h2o.stackedEnsemble(x = x, y = y, training_frame = train,
                           model_id = "my_ensemble_l1",
                           base_models = list(my_gbm@model_id, my_rf@model_id),
                           keep_levelone_frame = TRUE)
h2o.getFrame(stack@model$levelone_frame_id$name)
## End(Not run)
```

---

**h2o.getGLMFullRegularizationPath**

*Extract full regularization path from a GLM model*

## Description

Extract the full regularization path from a GLM model (assuming it was run with the lambda search option).

## Usage

```r
h2o.getGLMFullRegularizationPath(model)
```

## Arguments

- **model** an `H2OModel` corresponding from a `h2o.glm` call.
**h2o.getGrid**

*Get a grid object from H2O distributed K/V store.*

**Description**

Note that if neither cross-validation nor a validation frame is used in the grid search, then the training metrics will display in the "get grid" output. If a validation frame is passed to the grid, and nfolds = 0, then the validation metrics will display. However, if nfolds > 1, then cross-validation metrics will display even if a validation frame is provided.

**Usage**

```r
h2o.getGrid(grid_id, sort_by, decreasing, verbose = FALSE)
```

**Arguments**

- `grid_id` : ID of existing grid object to fetch
- `sort_by` : Sort the models in the grid space by a metric. Choices are "logloss", "residual_deviance", "mse", "auc", "accuracy", "precision", "recall", "f1", etc.
- `decreasing` : Specify whether sort order should be decreasing
- `verbose` : Controls verbosity of the output, if enabled prints out error messages for failed models (default: FALSE)

**Examples**

```r
## Not run:
library(h2o)
library(jsonlite)
h2o.init()
iris_hf <- as.h2o(iris)
h2o.grid("gbm", grid_id = "gbm_grid_id", x = c(1:4), y = 5,
training_frame = iris_hf, hyper_params = list(ntrees = c(1, 2, 3)))
grid <- h2o.getGrid("gbm_grid_id")
# Get grid summary
summary(grid)
# Fetch grid models
model_ids <- grid$model_ids
models <- lapply(model_ids, function(id) { h2o.getModel(id)})
## End(Not run)
```
**h2o.getId**  
*Get back-end distributed key/value store id from an H2OFrame.*

**Description**

Get back-end distributed key/value store id from an H2OFrame.

**Usage**

`h2o.getId(x)`

**Arguments**

- **x**  
  An H2OFrame

**Value**

The id of the H2OFrame

**Examples**

```r
## Not run:
library(h2o)
h2o.init()

iris <- h2o.importFile(f)
h2o.getId(iris)

## End(Not run)
```

---

**h2o.getLambdaBest**  
*Extract best lambda value found from glm model.*

**Description**

This function allows setting betas of an existing glm model.

**Usage**

`h2o.getLambdaBest(model)`

**Arguments**

- **model**  
  an `H2OModel` corresponding from a `h2o.glm` call.
**h2o.getLambdaMax**

*Extract the maximum lambda value used during lambda search from glm model.*

**Description**

This function allows setting betas of an existing glm model.

**Usage**

```r
h2o.getLambdaMax(model)
```

**Arguments**

- `model`: an H2OModel corresponding from a h2o.glm call.

---

**h2o.getLambdaMin**

*Extract the minimum lambda value calculated during lambda search from glm model. Note that due to early stop, this minimum lambda value may not be used in the actual lambda search.*

**Description**

This function allows setting betas of an existing glm model.

**Usage**

```r
h2o.getLambdaMin(model)
```

**Arguments**

- `model`: an H2OModel corresponding from a h2o.glm call.
**h2o.getModel**  
*Get an R reference to an H2O model*

**Description**

Returns a reference to an existing model in the H2O instance.

**Usage**

```r
h2o.getModel(model_id)
```

**Arguments**

- `model_id`  
  A string indicating the unique model_id of the model to retrieve.

**Value**

Returns an object that is a subclass of `H2OModel`.

**Examples**

```r
## Not run:  
library(h2o)  
h2o.init()  
iris_hf <- as.h2o(iris)  
model_id <- h2o.gbm(x = 1:4, y = 5, training_frame = iris_hf)@model_id  
model_retrieved <- h2o.getModel(model_id)
## End(Not run)
```

---

**h2o.getModelTree**  
*Fetches a single tree of a H2O model. This function is intended to be used on Gradient Boosting Machine models or Distributed Random Forest models.*

**Description**

Fetches a single tree of a H2O model. This function is intended to be used on Gradient Boosting Machine models or Distributed Random Forest models.

**Usage**

```r
h2o.getModelTree(model, tree_number, tree_class = NA)
```
h2o.getTimezone

**Arguments**

- **model** Model with trees
- **tree_number** Number of the tree in the model to fetch, starting with 1
- **tree_class** Name of the class of the tree (if applicable). This value is ignored for regression and binomial response column, as there is only one tree built. As there is exactly one class per categorical level, name of tree’s class equals to the corresponding categorical level of response column.

**Value**

Returns an H2OTree object with detailed information about a tree.

**Examples**

```
## Not run:
library(h2o)
h2o.init()

iris <- h2o.importFile(f)
gbm_model <- h2o.gbm(y = "species", training_frame = iris)
tree <- h2o.getModelTree(gbm_model, 1, "Iris-setosa")

## End(Not run)
```

---

**Description**

Get the Time Zone on the H2O cluster Returns a string

**Usage**

```
h2o.getTimezone()
```
h2o.getTypes  

Description
Get the types-per-column

Usage
h2o.getTypes(x)

Arguments
x  An H2OFrame

Value
A list of types per column

Examples
## Not run:
library(h2o)
h2o.init()

iris <- h2o.importFile(f)
h2o.getTypes(iris)

## End(Not run)

---

h2o.getVersion  

Description
Get h2o version

Usage
h2o.getVersion()
**h2o.get_automl**

*Description*

Get an R object that is a subclass of **H2OAutoML**

**Usage**

```r
h2o.get_automl(project_name)
```

**Arguments**

- `project_name` A string indicating the project name of the automl instance to retrieve.

**Value**

Returns an object that is a subclass of **H2OAutoML**.

**Examples**

```r
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.importFile(path = prostate_path, header = TRUE)
y <- "CAPSULE"
prostate[,y] <- as.factor(prostate[,y]) #convert to factor for classification
aml <- h2o.automl(y = y, training_frame = prostate,
                   max_runtime_secs = 30, project_name = "prostate")
aml2 <- h2o.get_automl("prostate")
## End(Not run)
```

**h2o.get_best_model**

*Description*

Get best model of a given family/algorithm for a given criterion from an AutoML object.

**Usage**

```r
h2o.get_best_model(h2o.automl_instance, family, algorithm, criterion)
```

**Arguments**

- `h2o.automl_instance` An instance of H2OAutoML from which to retrieve the best model.
- `family` A string specifying the family of the model (e.g., "binomial").
- `algorithm` A string specifying the algorithm (e.g., "cart").
- `criterion` A string specifying the criterion (e.g., "accuracy").

**Value**

An object representing the best model of the specified family, algorithm, and criterion.

**Examples**

```r
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.importFile(path = prostate_path, header = TRUE)
y <- "CAPSULE"
prostate[,y] <- as.factor(prostate[,y]) #convert to factor for classification
aml <- h2o.automl(y = y, training_frame = prostate,
                   max_runtime_secs = 30, project_name = "prostate")
aml_best <- h2o.get_best_model(h2o.automl_instance = aml, family = "binomial",
                                algorithm = "cart", criterion = "accuracy")
## End(Not run)
```
Usage

h2o.get_best_model(
  object,
  algorithm = c("any", "basemodel", "deeplearning", "drf", "gbm", "glm",
                "stackedensemble", "xgboost"),
  criterion = c("AUTO", "AUC", "AUCPR", "logloss", "MAE", "mean_per_class_error",
                "deviance", "MSE", "predict_time_per_row_ms", "RMSE", "RMSLE", "training_time_ms")
)

Arguments

object H2OAutoML object
algorithm One of "any", "basemodel", "deeplearning", "drf", "gbm", "glm", "stackedensemble", "xgboost"
criterion Criterion can be one of the metrics reported in the leaderboard. If set to NULL, the same ordering as in the leaderboard will be used. Available criteria:
  • Regression metrics: deviance, RMSE, MSE, MAE, RMSLE
  • Binomial metrics: AUC, logloss, AUCPR, mean_per_class_error, RMSE, MSE
  • Multinomial metrics: mean_per_class_error, logloss, RMSE, MSE, AUC, AUCPR

The following additional leaderboard information can be also used as a criterion:
  • 'training_time_ms': column providing the training time of each model in milliseconds (doesn’t include the training of cross validation models).
  • 'predict_time_per_row_ms': column providing the average prediction time by the model for a single row.

Value

An H2OModel or NULL if no model of a given family is present

Examples

```r
# Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.importFile(path = prostate_path, header = TRUE)
y <- "CAPSULE"
prostate[,y] <- as.factor(prostate[,y])  # convert to factor for classification
aml <- h2o.automl(y = y, training_frame = prostate, max_runtime_secs = 30)
gbm <- h2o.get_best_model(aml, "gbm")

# End(Not run)
```
h2o.get_leaderboard

Retrieve the leaderboard from the AutoML instance.

Description

Contrary to the default leaderboard attached to the automl instance, this one can return columns other than the metrics.

Usage

h2o.get_leaderboard(object, extra_columns = NULL)

Arguments

- **object**: The object for which to return the leaderboard. Currently, only H2OAutoML instances are supported.
- **extra_columns**: A string or a list of string specifying which optional columns should be added to the leaderboard. Defaults to None. Currently supported extensions are:
  - 'ALL': adds all columns below.
  - 'training_time_ms': column providing the training time of each model in milliseconds (doesn’t include the training of cross validation models).
  - 'predict_time_per_row_ms': column providing the average prediction time by the model for a single row.
  - 'algo': column providing the algorithm name for each model.

Value

An H2OFrame representing the leaderboard.

Examples

```r
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.importFile(path = prostate_path, header = TRUE)
y <- "CAPSULE"
prostate[,y] <- as.factor(prostate[,y])  #convert to factor for classification
aml <- h2o.automl(y = y, training_frame = prostate, max_runtime_secs = 30)
lb <- h2o.get_leaderboard(aml)
head(lb)

## End(Not run)
```
Description
Retrieve actual number of trees for tree algorithms

Usage
h2o.get_ntrees_actual(object)

Arguments
object An H2OModel object.

h2o.get_segment_models
Retrieves an instance of H2OSegmentModels for a given id.

Description
Retrieves an instance of H2OSegmentModels for a given id.

Usage
h2o.get_segment_models(segment_models_id)

Arguments
segment_models_id A string indicating the unique segment_models_id

Value
Returns an object that is a subclass of H2OSegmentModels.

Examples
## Not run:
library(h2o)
h2o.init()
iris_hf <- as.h2o(iris)
h2o.train_segments(algorithm = "gbm",
segment_columns = "Species", segment_models_id="models_by_species",
x = c(1:3), y = 4, training_frame = iris_hf, ntrees = 5, max_depth = 4)
models <- h2o.get_segment_models("models_by_species")
as.data.frame(models)

## End(Not run)
**Description**

Retrieves the GINI coefficient from an H2OBinomialMetrics. If "train", "valid", and "xval" parameters are FALSE (default), then the training GINI value is returned. If more than one parameter is set to TRUE, then a named vector of GINIs are returned, where the names are "train", "valid" or "xval".

**Usage**

`h2o.giniCoef(object, train = FALSE, valid = FALSE, xval = FALSE)`

**Arguments**

- `object` an H2OBinomialMetrics object.
- `train` Retrieve the training GINI Coefficient
- `valid` Retrieve the validation GINI Coefficient
- `xval` Retrieve the cross-validation GINI Coefficient

**See Also**

- `h2o.auc` for AUC, `h2o.giniCoef` for the GINI coefficient, and `h2o.metric` for the various threshold metrics. See `h2o.performance` for creating H2OModelMetrics objects.

**Examples**

```r
## Not run:
library(h2o)
h2o.init()

prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(prostate_path)
prostate[, 2] <- as.factor(prostate[, 2])
model <- h2o.gbm(x = 3:9, y = 2, training_frame = prostate, distribution = "bernoulli")
perf <- h2o.performance(model, prostate)
h2o.giniCoef(perf)

## End(Not run)
```
**h2o.glm**

*Fit a generalized linear model*

**Description**

Fits a generalized linear model, specified by a response variable, a set of predictors, and a description of the error distribution.

**Usage**

```r
h2o.glm(
  x, 
  y, 
  training_frame, 
  model_id = NULL, 
  validation_frame = NULL, 
  nfolds = 0, 
  checkpoint = NULL, 
  export_checkpoints_dir = NULL, 
  seed = -1, 
  keep_cross_validation_models = TRUE, 
  keep_cross_validation_predictions = FALSE, 
  keep_cross_validation_fold_assignment = FALSE, 
  fold_assignment = c("AUTO", "Random", "Modulo", "Stratified"), 
  fold_column = NULL, 
  random_columns = NULL, 
  ignore_const_cols = TRUE, 
  score_each_iteration = FALSE, 
  score_iteration_interval = -1, 
  offset_column = NULL, 
  weights_column = NULL, 
  family = c("AUTO", "gaussian", "binomial", "fractionalbinomial", "quasibinomial", "ordinal", "multinomial", "poisson", "gamma", "tweedie", "negativebinomial"), 
  rand_family = c("[gaussian]"), 
  tweedie_variance_power = 0, 
  tweedie_link_power = 1,

generate_scoring_history = FALSE,
auc_type = c("AUTO", "NONE", "MACRO_OVR", "WEIGHTED_OVR", "MACRO_OVO",
             "WEIGHTED_OVO")
)

Arguments

**x**
(Optional) A vector containing the names or indices of the predictor variables to
use in building the model. If x is missing, then all columns except y are used.

**y**
The name or column index of the response variable in the data. The response
must be either a numeric or a categorical/factor variable. If the response is
numeric, then a regression model will be trained, otherwise it will train a classi-
fication model.

**training_frame**  Id of the training data frame.

**model_id**  Destination Id for this model; auto-generated if not specified.
validation_frame

Id of the validation data frame.

nfolds

Number of folds for K-fold cross-validation (0 to disable or >= 2). Defaults to 0.

checkpoint

Model checkpoint to resume training with.

eexport_checkpoints_dir

Automatically export generated models to this directory.

seed

Seed for random numbers (affects certain parts of the algo that are stochastic and those might or might not be enabled by default). Defaults to -1 (time-based random number).

keep_cross_validation_models

Logical. Whether to keep the cross-validation models. Defaults to TRUE.

keep_cross_validation_predictions

Logical. Whether to keep the predictions of the cross-validation models. Defaults to FALSE.

keep_cross_validation_fold_assignment

Logical. Whether to keep the cross-validation fold assignment. Defaults to FALSE.

fold_assignment

Cross-validation fold assignment scheme, if fold_column is not specified. The 'Stratified' option will stratify the folds based on the response variable, for classification problems. Must be one of: "AUTO", "Random", "Modulo", "Stratified". Defaults to AUTO.

fold_column

Column with cross-validation fold index assignment per observation.

random_columns

random columns indices for HGLM.

ignore_const_cols

Logical. Ignore constant columns. Defaults to TRUE.

score_each_iteration

Logical. Whether to score during each iteration of model training. Defaults to FALSE.

score_iteration_interval

Perform scoring for every score_iteration_interval iterations Defaults to -1.

offset_column

Offset column. This will be added to the combination of columns before applying the link function.

weights_column

Column with observation weights. Giving some observation a weight of zero is equivalent to excluding it from the dataset; giving an observation a relative weight of 2 is equivalent to repeating that row twice. Negative weights are not allowed. Note: Weights are per-row observation weights and do not increase the size of the data frame. This is typically the number of times a row is repeated, but non-integer values are supported as well. During training, rows with higher weights matter more, due to the larger loss function pre-factor.

family

Family. Use binomial for classification with logistic regression, others are for regression problems. Must be one of: "AUTO", "gaussian", "binomial", "fractionalbinomial", "quasibinomial", "ordinal", "multinomial", "poisson", "gamma", "tweedie", "negativebinomial". Defaults to AUTO.
**rand_family**
Random Component Family array. One for each random component. Only support gaussian for now. Must be one of: "[gaussian]".

**tweedie_variance_power**
Tweedie variance power Defaults to 0.

**tweedie_link_power**
Tweedie link power Defaults to 1.

**theta**
Theta Defaults to 1e-10.

**solver**
AUTO will set the solver based on given data and the other parameters. IRLSM is fast on on problems with small number of predictors and for lambda-search with L1 penalty, L_BFGS scales better for datasets with many columns. Must be one of: "AUTO", "IRLSM", "L_BFGS", "COORDINATE_DESCENT_NAIVE", "COORDINATE_DESCENT", "GRADIENT_DESCENT_LH", "GRADIENT_DESCENT_SQERR". Defaults to AUTO.

**alpha**
Distribution of regularization between the L1 (Lasso) and L2 (Ridge) penalties. A value of 1 for alpha represents Lasso regression, a value of 0 produces Ridge regression, and anything in between specifies the amount of mixing between the two. Default value of alpha is 0 when SOLVER = 'L-BFGS'; 0.5 otherwise.

**lambda**
Regularization strength

**lambda_search**
Logical. Use lambda search starting at lambda max, given lambda is then interpreted as lambda min Defaults to FALSE.

**early_stopping**
Logical. Stop early when there is no more relative improvement on train or validation (if provided) Defaults to TRUE.

**nlambdas**
Number of lambdas to be used in a search. Default indicates: If alpha is zero, with lambda search set to True, the value of nlamdas is set to 30 (fewer lambdas are needed for ridge regression) otherwise it is set to 100. Defaults to -1.

**standardize**
Logical. Standardize numeric columns to have zero mean and unit variance Defaults to TRUE.

**missing_values_handling**
Handling of missing values. Either MeanImputation, Skip or PlugValues. Must be one of: "MeanImputation", "Skip", "PlugValues". Defaults to MeanImputation.

**plug_values**
Plug Values (a single row frame containing values that will be used to impute missing values of the training/validation frame, use with conjunction missing_values_handling = PlugValues)

**compute_p_values**
Logical. Request p-values computation, p-values work only with IRLSM solver and no regularization Defaults to FALSE.

**remove_collinear_columns**
Logical. In case of linearly dependent columns, remove some of the dependent columns Defaults to FALSE.

**intercept**
Logical. Include constant term in the model Defaults to TRUE.

**non_negative**
Logical. Restrict coefficients (not intercept) to be non-negative Defaults to FALSE.

**max_iterations**
Maximum number of iterations Defaults to -1.
objective_epsilon
Converge if objective value changes less than this. Default indicates: If lambda_search is set to True the value of objective_epsilon is set to .0001. If the lambda_search is set to False and lambda is equal to zero, the value of objective_epsilon is set to .000001, for any other value of lambda the default value of objective_epsilon is set to .0001. Defaults to -1.

beta_epsilon
Converge if beta changes less (using L-infinity norm) than beta epsilon, ONLY applies to IRLSM solver Defaults to 0.0001.

gradient_epsilon
Converge if objective changes less (using L-infinity norm) than this, ONLY applies to L-BFGS solver. Default indicates: If lambda_search is set to False and lambda is equal to zero, the default value of gradient_epsilon is equal to .000001, otherwise the default value is .0001. If lambda_search is set to True, the conditional values above are 1E-8 and 1E-6 respectively. Defaults to -1.

link
Link function. Must be one of: "family_default", "identity", "logit", "log", "inverse", "tweedie", "o-logit". Defaults to family_default.

rand_link
Link function array for random component in HGLM. Must be one of: "[identity]", "[family_default]".

startval
double array to initialize fixed and random coefficients for HGLM, coefficients for GLM.

calc_like
 Logical. if true, will return likelihood function value for HGLM. Defaults to FALSE.

HGLM
Logical. If set to true, will return HGLM model. Otherwise, normal GLM model will be returned Defaults to FALSE.

prior
Prior probability for y==1. To be used only for logistic regression iff the data has been sampled and the mean of response does not reflect reality. Defaults to -1.

cold_start
Logical. Only applicable to multiple alpha/lambda values. If false, build the next model for next set of alpha/lambda values starting from the values provided by current model. If true will start GLM model from scratch. Defaults to FALSE.

lambda_min_ratio
Minimum lambda used in lambda search, specified as a ratio of lambda_max (the smallest lambda that drives all coefficients to zero). Default indicates: if the number of observations is greater than the number of variables, then lambda_min_ratio is set to 0.0001; if the number of observations is less than the number of variables, then lambda_min_ratio is set to 0.01. Defaults to -1.

beta_constraints
Beta constraints

max_active_predictors
Maximum number of active predictors during computation. Use as a stopping criterion to prevent expensive model building with many predictors. Default indicates: If the IRLSM solver is used, the value of max_active_predictors is set to 5000 otherwise it is set to 100000000. Defaults to -1.

interactions
A list of predictor column indices to interact. All pairwise combinations will be computed for the list.
interaction_pairs
A list of pairwise (first order) column interactions.

obj_reg
Likelihood divider in objective value computation, default is 1/nobs Defaults to -1.

stopping_rounds
Early stopping based on convergence of stopping_metric. Stop if simple moving average of length k of the stopping_metric does not improve for k:=stopping_rounds scoring events (0 to disable) Defaults to 0.

stopping_metric
Metric to use for early stopping (AUTO: logloss for classification, deviance for regression and anomaly_score for Isolation Forest). Note that custom and custom_increasing can only be used in GBM and DRF with the Python client. Must be one of: "AUTO", "deviance", "logloss", "MSE", "RMSE", "MAE", "RMSLE", "AUC", "AUCPR", "lift_top_group", "misclassification", "mean_per_class_error", "custom", "custom_increasing". Defaults to AUTO.

stopping_tolerance
Relative tolerance for metric-based stopping criterion (stop if relative improvement is not at least this much) Defaults to 0.001.

balance_classes
Logical. Balance training data class counts via over/under-sampling (for imbalanced data). Defaults to FALSE.

class_sampling_factors
Desired over/under-sampling ratios per class (in lexicographic order). If not specified, sampling factors will be automatically computed to obtain class balance during training. Requires balance_classes.

max_after_balance_size
Maximum relative size of the training data after balancing class counts (can be less than 1.0). Requires balance_classes. Defaults to 5.0.

max_runtime_secs
Maximum allowed runtime in seconds for model training. Use 0 to disable. Defaults to 0.

custom_metric_func
Reference to custom evaluation function, format: ‘language:keyName=funcName’

generate_scoring_history
Logical. If set to true, will generate scoring history for GLM. This may significantly slow down the algo. Defaults to FALSE.

auc_type
Set default multinomial AUC type. Must be one of: "AUTO", "NONE", "MACRO_OVR", "WEIGHTED_OVR", "MACRO_OVO", "WEIGHTED_OVO". Defaults to AUTO.

Value
A subclass of H2OModel is returned. The specific subclass depends on the machine learning task at hand (if it’s binomial classification, then an H2OBinomialModel is returned, if it’s regression then a H2ORegressionModel is returned). The default print- out of the models is shown, but further GLM-specific information can be queried out of the object. To access these various items, please refer to the seealso section below. Upon completion of the GLM, the resulting object has coefficients, normalized coefficients, residual/null deviance, aic, and a host of model metrics including
MSE, AUC (for logistic regression), degrees of freedom, and confusion matrices. Please refer to the more in-depth GLM documentation available here: https://h2o-release.s3.amazonaws.com/h2o-dev/rel-shannon/2/docs-website/h2o-docs/index.html#Data+Science+Algorithms-GLM

---

**h2o.glm**

*Generalized low rank decomposition of an H2O data frame*

**Description**

Builds a generalized low rank decomposition of an H2O data frame
Usage

```r
h2o.glrm(
    training_frame,
    cols = NULL,
    model_id = NULL,
    validation_frame = NULL,
    ignore_const_cols = TRUE,
    score_each_iteration = FALSE,
    representation_name = NULL,
    loading_name = NULL,
    transform = c("NONE", "STANDARDIZE", "NORMALIZE", "DEMEAN", "DESCALE"),
    k = 1,
    loss = c("Quadratic", "Absolute", "Huber", "Poisson", "Hinge", "Logistic", "Periodic"),
    loss_by_col_idx = NULL,
    multi_loss = c("Categorical", "Ordinal"),
    period = 1,
    regularization_x = c("None", "Quadratic", "L2", "L1", "NonNegative", "OneSparse", "UnitOneSparse", "Simplex"),
    regularization_y = c("None", "Quadratic", "L2", "L1", "NonNegative", "OneSparse", "UnitOneSparse", "Simplex"),
    gamma_x = 0,
    gamma_y = 0,
    max_iterations = 1000,
    max_updates = 2000,
    init_step_size = 1,
    min_step_size = 1e-04,
    seed = -1,
    init = c("Random", "SVD", "PlusPlus", "User"),
    svd_method = c("GramSVD", "Power", "Randomized"),
    user_y = NULL,
    user_x = NULL,
    expand_user_y = TRUE,
    impute_original = FALSE,
    recover_svd = FALSE,
    max_runtime_secs = 0,
    export_checkpoints_dir = NULL
)
```

Arguments

- **training_frame**: Id of the training data frame.
- **cols**: (Optional) A vector containing the data columns on which k-means operates.
- **model_id**: Destination id for this model; auto-generated if not specified.
- **validation_frame**: Id of the validation data frame.
ignore_const_cols
  Logical. Ignore constant columns. Defaults to TRUE.

score_each_iteration
  Logical. Whether to score during each iteration of model training. Defaults to FALSE.

representation_name
  Frame key to save resulting X

loading_name
  [Deprecated] Use representation_name instead. Frame key to save resulting X.

transform
  Transformation of training data Must be one of: "NONE", "STANDARDIZE", "NORMALIZE", "DEMEAN", "DESCALE". Defaults to NONE.

k
  Rank of matrix approximation Defaults to 1.

loss

loss_by_col
  Loss function by column (override) Must be one of: "Quadratic", "Absolute", "Huber", "Poisson", "Hinge", "Logistic", "Periodic", "Categorical", "Ordinal".

loss_by_col_idx
  Loss function by column index (override)

multi_loss
  Categorical loss function Must be one of: "Categorical", "Ordinal". Defaults to Categorical.

period
  Length of period (only used with periodic loss function) Defaults to 1.

regularization_x
  Regularization function for X matrix Must be one of: "None", "Quadratic", "L2", "L1", "NonNegative", "OneSparse", "UnitOneSparse", "Simplex". Defaults to None.

regularization_y
  Regularization function for Y matrix Must be one of: "None", "Quadratic", "L2", "L1", "NonNegative", "OneSparse", "UnitOneSparse", "Simplex". Defaults to None.

gamma_x
  Regularization weight on X matrix Defaults to 0.

gamma_y
  Regularization weight on Y matrix Defaults to 0.

max_iterations
  Maximum number of iterations Defaults to 1000.

max_updates
  Maximum number of updates, defaults to 2*max_iterations Defaults to 2000.

init_step_size
  Initial step size Defaults to 1.

min_step_size
  Minimum step size Defaults to 0.0001.

seed
  Seed for random numbers (affects certain parts of the algo that are stochastic and those might or might not be enabled by default). Defaults to -1 (time-based random number).

init
  Initialization mode Must be one of: "Random", "SVD", "PlusPlus", "User". Defaults to PlusPlus.

svd_method
  Method for computing SVD during initialization (Caution: Randomized is currently experimental and unstable) Must be one of: "GramSVD", "Power", "Randomized". Defaults to Randomized.

user_y
  User-specified initial Y
user_x                  User-specified initial X
expand_user_y Logical. Expand categorical columns in user-specified initial Y Defaults to TRUE.
impute_original Logical. Reconstruct original training data by reversing transform Defaults to FALSE.
recover_svd Logical. Recover singular values and eigenvectors of XY Defaults to FALSE.
max_runtime_secs Maximum allowed runtime in seconds for model training. Use 0 to disable. Defaults to 0.
export_checkpoints_dir Automatically export generated models to this directory.

Value

an object of class H2ODimReductionModel.

Examples

## Not run:
library(h2o)
h2o.init()
australia_path <- system.file("extdata", "australia.csv", package = "h2o")
australia <- h2o.uploadFile(path = australia_path)
h2o.glrm(training_frame = australia, k = 5, loss = "Quadratic", regularization_x = "L1",
          gamma_x = 0.5, gamma_y = 0, max_iterations = 1000)

## End(Not run)
h2o.grep

Search for matches to an argument pattern

Description

Searches for matches to argument ‘pattern’ within each element of a string column.

Usage

h2o.grep(
    pattern,
    x,
    ignore.case = FALSE,
    invert = FALSE,
    output.logical = FALSE
)

Arguments

pattern A character string containing a regular expression.
x An H2O frame that wraps a single string column.
ignore.case If TRUE case is ignored during matching.
invert Identify elements that do not match the pattern.
output.logical If TRUE returns logical vector of indicators instead of list of matching positions

Details

This function has similar semantics as R’s native grep function and it supports a subset of its parameters. Default behavior is to return indices of the elements matching the pattern. Parameter ‘output.logical’ can be used to return a logical vector indicating if the element matches the pattern (1) or not (0).

Value

H2OFrame holding the matching positions or a logical vector if ‘output.logical’ is enabled.

Examples

## Not run:
library(h2o)
h2o.init()
addresses <- as.h2o(c("2307", "Leghorn St", "Mountain View", "CA", "94043"))
zip_codes <- addresses[h2o.grep("[0-9]{5}\", addresses, output.logical = TRUE),]

## End(Not run)
Description

Provides a set of functions to launch a grid search and get its results.

Usage

h2o.grid(
  algorithm,
  grid_id,
  x,
  y,
  training_frame,
  ..., hyper_params = list(),
  is_supervised = NULL,
  do_hyper_params_check = FALSE,
  search_criteria = NULL,
  export_checkpoints_dir = NULL,
  recovery_dir = NULL,
  parallelism = 1
)

Arguments

algorithm       Name of algorithm to use in grid search (gbm, randomForest, kmeans, glm, deepLearning, naivebayes, pca).
grid_id         (Optional) ID for resulting grid search. If it is not specified then it is autogenerated.
x               (Optional) A vector containing the names or indices of the predictor variables to use in building the model. If x is missing, then all columns except y are used.
y               The name or column index of the response variable in the data. The response must be either a numeric or a categorical/factor variable. If the response is numeric, then a regression model will be trained, otherwise it will train a classification model.
training_frame Id of the training data frame.
...            arguments describing parameters to use with algorithm (i.e., x, y, training_frame). Look at the specific algorithm - h2o.gbm, h2o.glm, h2o.kmeans, h2o.deepLearning - for available parameters.
hyper_params    List of lists of hyper parameters (i.e., list(ntrees=c(1,2),max_depth=c(5,7))).
is_supervised   (Optional) If specified then override the default heuristic which decides if the given algorithm name and parameters specify a supervised or unsupervised algorithm.
do_hyper_params_check

Perform client check for specified hyper parameters. It can be time expensive for large hyper space.

search_criteria

(Optional) List of control parameters for smarter hyperparameter search. The list can include values for: strategy, max_models, max_runtime_secs, stopping_metric, stopping_tolerance, stopping_rounds and seed. The default strategy 'Cartesian' covers the entire space of hyperparameter combinations. If you want to use cartesian grid search, you can leave the search_criteria argument unspecified. Specify the "RandomDiscrete" strategy to get random search of all the combinations of your hyperparameters with three ways of specifying when to stop the search: max number of models, max time, and metric-based early stopping (e.g., stop if MSE has not improved by 0.0001 over the 5 best models). Examples below: list(strategy = "RandomDiscrete", max_runtime_secs = 600, max_models = 100, stopping_metric = "AUTO", stopping_tolerance = 0.00001, stopping_rounds = 5, seed = 123456) or list(strategy = "RandomDiscrete", max_models = 42, max_runtime_secs = 28800) or list(strategy = "RandomDiscrete", stopping_metric = "AUTO", stopping_tolerance = 0.001, stopping_rounds = 10) or list(strategy = "RandomDiscrete", stopping_metric = "misclassification", stopping_tolerance = 0.00001, stopping_rounds = 5).

export_checkpoints_dir

Directory to automatically export grid and its models to.

recovery_dir

When specified the grid and all necessary data (frames, models) will be saved to this directory (use HDFS or other distributed file-system). Should the cluster crash during training, the grid can be reloaded from this directory via h2o.loadGrid and training can be resumed.

parallelism

Level of Parallelism during grid model building. 1 = sequential building (default). Use the value of 0 for adaptive parallelism - decided by H2O. Any number > 1 sets the exact number of models built in parallel.

Details

Launch grid search with given algorithm and parameters.

Examples

```r
## Not run:
library(h2o)
library(jsonlite)
h2o.init()
iris_hf <- as.h2o(iris)
grid <- h2o.grid("gbm", x = c(1:4), y = 5, training_frame = iris_hf, hyper_params = list(ntrees = c(1, 2, 3)))
# Get grid summary
summary(grid)
# Fetch grid models
model_ids <- grid@model_ids
models <- lapply(model_ids, function(id) { h2o.getModel(id)})
## End(Not run)
```
h2o.group_by

Group and Apply by Column

Description
Performs a group by and apply similar to `ddply`.

Usage

```r
h2o.group_by(
  data,
  by,
  ...,
  gb.control = list(na.methods = NULL, col.names = NULL)
)
```

Arguments

data  
an H2OFrame object.

by  
a list of column names

...  
any supported aggregate function. See Details: for more help.

gb.control  
a list of how to handle NA values in the dataset as well as how to name output columns. The method is specified using the `rm.method` argument. See Details: for more help.

Details

In the case of `na.methods` within `gb.control`, there are three possible settings. "all" will include NAs in computation of functions. "rm" will completely remove all NA fields. "ignore" will remove NAs from the numerator but keep the rows for computational purposes. If a list smaller than the number of columns groups is supplied, the list will be padded by "ignore".

Note that to specify a list of column names in the `gb.control` list, you must add the `col.names` argument. Similar to `na.methods`, `col.names` will pad the list with the default column names if the length is less than the number of columns groups supplied.

Supported functions include `nrow`. This function is required and accepts a string for the name of the generated column. Other supported aggregate functions accept `col` and `na` arguments for specifying columns and the handling of NAs ("all", "ignore", and `GroupBy` object; `max` calculates the maximum of each column specified in `col` for each group of a `GroupBy` object; `mean` calculates the mean of each column specified in `col` for each group of a `GroupBy` object; `min` calculates the minimum of each column specified in `col` for each group of a `GroupBy` object; `mode` calculates the mode of each column specified in `col` for each group of a `GroupBy` object; `sd` calculates the standard deviation of each column specified in `col` for each group of a `GroupBy` object; `ss` calculates the sum of squares of each column specified in `col` for each group of a `GroupBy` object; `sum` calculates the sum of each column specified in `col` for each group of a `GroupBy` object; and `var` calculates the variance of each column specified in `col` for each group of a `GroupBy` object. If an aggregate is provided without a value (for example, as `max` in `sum(col="X1",na="all").mean(col="X5",na="all").max()`),
then it is assumed that the aggregation should apply to all columns except the GroupBy columns. However, operations will not be performed on String columns. They will be skipped. Note again that nrow is required and cannot be empty.

**Value**

Returns a new H2OFrame object with columns equivalent to the number of groups created.

**Examples**

```r
## Not run:
library(h2o)
h2o.init()
df <- h2o.importFile(paste("https://s3.amazonaws.com/h2o-public-test-data",
                           "/smalldata/prostate/prostate.csv",
                           sep=""))
h2o.group_by(data = df, by = "RACE", nrow("VOL"))
## End(Not run)
```

**Description**

Creates a copy of the target column in which each string has all occurrence of the regex pattern replaced with the replacement substring.

**Usage**

```r
h2o.gsub(pattern, replacement, x, ignore.case = FALSE)
```

**Arguments**

- `pattern`: The pattern to replace.
- `replacement`: The replacement pattern.
- `x`: The column on which to operate.
- `ignore.case`: Case sensitive or not

**Examples**

```r
## Not run:
library(h2o)
h2o.init()
string_to_gsub <- as.h2o("r tutorial")
sub_string <- h2o.gsub("r ", "H2O ", string_to_gsub)
## End(Not run)
```
h2o.head

Return the Head or Tail of an H2O Dataset.

Description

Returns the first or last rows of an H2OFrame object.

Usage

h2o.head(x, n = 6L, m = 200L, ...)  
  ## S3 method for class 'H2OFrame'
  head(x, n = 6L, m = 200L, ...)  

h2o.tail(x, n = 6L, m = 200L, ...)  
  ## S3 method for class 'H2OFrame'
  tail(x, n = 6L, m = 200L, ...)

Arguments

x  An H2OFrame object.

n  (Optional) A single integer. If positive, number of rows in x to return. If negative, all but the n first/last number of rows in x.

m  (Optional) A single integer. If positive, number of columns in x to return. If negative, all but the m first/last number of columns in x.

...  Ignored.

Value

An H2OFrame containing the first or last n rows and m columns of an H2OFrame object.

Examples

## Not run:
library(h2o)
h2o.init(ip <- "localhost", port = 54321, startH2O = TRUE)
australia_path <- system.file("extdata", "australia.csv", package = "h2o")
australia <- h2o.uploadFile(path = australia_path)
# Return the first 10 rows and 6 columns
h2o.head(australia, n = 10L, m = 6L)
# Return the last 10 rows and 6 columns
h2o.tail(australia, n = 10L, m = 6L)

# For Jupyter notebook with an R kernel,
# view all rows of a data frame
options(repr.matrix.max.rows = 600, repr.matrix.max.cols = 200)

## End(Not run)
**h2o.HGLMMetrics**  
*Retrieve HGLM ModelMetrics*

**Description**  
Retrieve HGLM ModelMetrics

**Usage**  
h2o.HGLMMetrics(object)

**Arguments**  

| object          | an H2OModel object or H2OModelMetrics. |

**h2o.hist**  
*Compute A Histogram*

**Description**  
Compute a histogram over a numeric column. If breaks=="FD", the MAD is used over the IQR in computing bin width. Note that we do not beautify the breakpoints as R does.

**Usage**  
h2o.hist(x, breaks = "Sturges", plot = TRUE)

**Arguments**  

<table>
<thead>
<tr>
<th>x</th>
<th>A single numeric column from an H2OFrame.</th>
</tr>
</thead>
<tbody>
<tr>
<td>breaks</td>
<td>Can be one of the following: A string: &quot;Sturges&quot;, &quot;Rice&quot;, &quot;sqrt&quot;, &quot;Doane&quot;, &quot;FD&quot;, &quot;Scott&quot; A single number for the number of breaks splitting the range of the vec into number of breaks bins of equal width A vector of numbers giving the split points, e.g., c(-50,213.2132,9324834)</td>
</tr>
<tr>
<td>plot</td>
<td>A logical value indicating whether or not a plot should be generated (default is TRUE).</td>
</tr>
</tbody>
</table>

**Examples**  
```r
## Not run:
library(h2o)
h2o.init()

iris <- h2o.importFile(f)
h2o.asnumeric(iris["petal_len"])
```
### h2o.hit_ratio_table

**Retrieve the Hit Ratios**

#### Description

If "train", "valid", and "xval" parameters are FALSE (default), then the training Hit Ratios value is returned. If more than one parameter is set to TRUE, then a named list of Hit Ratio tables are returned, where the names are "train", "valid" or "xval".

#### Usage

```r
h2o.hit_ratio_table(object, train = FALSE, valid = FALSE, xval = FALSE)
```

#### Arguments

- **object**: An `H2OModel` object.
- **train**: Retrieve the training Hit Ratio
- **valid**: Retrieve the validation Hit Ratio
- **xval**: Retrieve the cross-validation Hit Ratio

#### Examples

```r
## Not run:
library(h2o)
h2o.init()

iris <- h2o.importFile(f)
iris_split <- h2o.splitFrame(data = iris, ratios = 0.8, seed = 1234)
train <- iris_split[[1]]
valid <- iris_split[[2]]

iris_xgb <- h2o.xgboost(x = 1:4, y = 5, training_frame = train, validation_frame = valid)
hrt_iris <- h2o.hit_ratio_table(iris_xgb, valid = TRUE)
hrt_iris

## End(Not run)
```
h2o.hour  

Convert Milliseconds to Hour of Day in H2O Datasets

Description

Converts the entries of an H2OFrame object from milliseconds to hours of the day (on a 0 to 23 scale).

Usage

h2o.hour(x)

Arguments

x  
An H2OFrame object.

Value

An H2OFrame object containing the entries of x converted to hours of the day.

See Also

h2o.day

h2o.ice_plot  

Plot Individual Conditional Expectation (ICE) for each decile

Description

Individual Conditional Expectation (ICE) plot gives a graphical depiction of the marginal effect of a variable on the response. ICE plots are similar to partial dependence plots (PDP); PDP shows the average effect of a feature while ICE plot shows the effect for a single instance. This function will plot the effect for each decile. In contrast to the PDP, ICE plots can provide more insight, especially when there is stronger feature interaction.

Usage

h2o.ice_plot(model, newdata, column, target = NULL, max_levels = 30)
### Arguments

- **model**: An H2OModel.
- **newdata**: An H2OFrame.
- **column**: A feature column name to inspect.
- **target**: If multinomial, plot PDP just for target category. Character string.
- **max_levels**: An integer specifying the maximum number of factor levels to show. Defaults to 30.

### Value

A ggplot2 object

### Examples

```r
## Not run:
library(h2o)
h2o.init()

# Import the wine dataset into H2O:
df <- h2o.importFile(f)

# Set the response
target <- "quality"

# Split the dataset into a train and test set:
splits <- h2o.splitFrame(df, ratios = 0.8, seed = 1)
train <- splits[[1]]
test <- splits[[2]]

# Build and train the model:
gbm <- h2o.gbm(y = target,
               training_frame = train)

# Create the individual conditional expectations plot
ice <- h2o.ice_plot(gbm, test, column = "alcohol")
print(ice)

## End(Not run)
```

---

### Description

Applies conditional statements to numeric vectors in H2O parsed data objects when the data are numeric.
Usage

h2o.ifelse(test, yes, no)

ifelse(test, yes, no)

Arguments

test A logical description of the condition to be met (> , <, =, etc...)

yes The value to return if the condition is TRUE.

no The value to return if the condition is FALSE.

Details

Both numeric and categorical values can be tested. However when returning a yes and no condition both conditions must be either both categorical or numeric.

Value

Returns a vector of new values matching the conditions stated in the ifelse call.

Examples

## Not run:
library(h2o)
h2o.init()
australia_path <- system.file("extdata", "australia.csv", package = "h2o")
australia <- h2o.importFile(path = australia_path)
australia[, 9] <- ifelse(australia[, 3] < 279.9, 1, 0)
summary(australia)

## End(Not run)

---

**h2o.importFile**

**Import Files into H2O**

Description

Imports files into an H2O cluster. The default behavior is to pass-through to the parse phase automatically.

Usage

h2o.importFile(
  path,
  destination_frame = "",
  parse = TRUE,
  header = NA,
h2o.importFile

  sep = "",
  col.names = NULL,
  col.types = NULL,
  na.strings = NULL,
  decrypt_tool = NULL,
  skipped_columns = NULL,
  custom_non_data_line_markers = NULL,
  partition.by = NULL,
  quotechar = NULL,
  escapechar = ""
)

h2o.importFolder(
  path,
  pattern = "", 
  destination_frame = "", 
  parse = TRUE,
  header = NA,
  sep = "", 
  col.names = NULL,
  col.types = NULL,
  na.strings = NULL,
  decrypt_tool = NULL,
  skipped_columns = NULL,
  custom_non_data_line_markers = NULL,
  partition.by = NULL,
  quotechar = NULL,
  escapechar = "\\"
)

h2o.importHDFS(
  path,
  pattern = "", 
  destination_frame = "", 
  parse = TRUE,
  header = NA,
  sep = "", 
  col.names = NULL,
  na.strings = NULL
)

h2o.uploadFile(
  path,
  destination_frame = "", 
  parse = TRUE,
  header = NA,
  sep = "", 
  col.names = NULL,
Arguments

path
The complete URL or normalized file path of the file to be imported. Each row of data appears as one line of the file.

destination_frame
(Optional) The unique hex key assigned to the imported file. If none is given, a key will automatically be generated based on the URL path.

parse
(Optional) A logical value indicating whether the file should be parsed after import, for details see h2o.parseRaw.

header
(Optional) A logical value indicating whether the first line of the file contains column headers. If left empty, the parser will try to automatically detect this.

sep
(Optional) The field separator character. Values on each line of the file are separated by this character. If sep = "", the parser will automatically detect the separator.

col.names
(Optional) An H2OFrame object containing a single delimited line with the column names for the file.

col.types
(Optional) A vector to specify whether columns should be forced to a certain type upon import parsing.

na.strings
(Optional) H2O will interpret these strings as missing.

decrypt_tool
(Optional) Specify a Decryption Tool (key-reference acquired by calling h2o.decryptionSetup).

skipped_columns
A list of column indices to be skipped during parsing.

custom_non_data_line_markers
(Optional) If a line in imported file starts with any character in given string it will NOT be imported. Empty string means all lines are imported, NULL means that default behaviour for given format will be used.

partition_by
names of the columns the persisted dataset has been partitioned by.

quotechar
A hint for the parser which character to expect as quoting character. None (default) means autodetection.

escapechar
(Optional) One ASCII character used to escape other characters.

pattern
(Optional) Character string containing a regular expression to match file(s) in the folder.

progressBar
(Optional) When FALSE, tell H2O parse call to block synchronously instead of polling. This can be faster for small datasets but loses the progress bar.

parse_type
(Optional) Specify which parser type H2O will use. Valid types are "ARFF", "XLS", "CSV", "SVMLight"
h2o.import_hive_table

Import Hive Table into H2O

Description

Import Hive table to H2OFrame in memory. Make sure to start H2O with Hive on classpath. Uses hive-site.xml on classpath to connect to Hive. When database is specified as jdbc URL uses Hive JDBC driver to obtain table metadata. then uses direct HDFS access to import data.

Details

h2o.importFile is a parallelized reader and pulls information from the server from a location specified by the client. The path is a server-side path. This is a fast, scalable, highly optimized way to read data. H2O pulls the data from a data store and initiates the data transfer as a read operation.

Unlike the import function, which is a parallelized reader, h2o.uploadFile is a push from the client to the server. The specified path must be a client-side path. This is not scalable and is only intended for smaller data sizes. The client pushes the data from a local filesystem (for example, on your machine where R is running) to H2O. For big-data operations, you don’t want the data stored on or flowing through the client.

h2o.importFolder imports an entire directory of files. If the given path is relative, then it will be relative to the start location of the H2O instance. The default behavior is to pass-through to the parse phase automatically.

h2o.importHDFS is deprecated. Instead, use h2o.importFile.

See Also

h2o.import_sql_select, h2o.import_sql_table, h2o.parseRaw

Examples

```r
## Not run:
h2o.init(ip = "localhost", port = 54321, startH2O = TRUE)
prostate_path = system.file("extdata", "prostate.csv", package = "h2o")
prostate = h2o.importFile(path = prostate_path)
class(prostate)
summary(prostate)

#Import files with a certain regex pattern by utilizing h2o.importFolder()
#In this example we import all .csv files in the directory prostate_folder
prostate_path = system.file("extdata", "prostate_folder", package = "h2o")
prostate_pattern = h2o.importFolder(path = prostate_path, pattern = ".*.csv")
class(prostate_pattern)
summary(prostate_pattern)

## End(Not run)
```
Usage

```r
h2o.import_hive_table(
  database,
  table,
  partitions = NULL,
  allow_multi_format = FALSE
)
```

Arguments

database: Name of Hive database (default database will be used by default), can be also a JDBC URL

table: name of Hive table to import

partitions: a list of lists of strings - partition key column values of partitions you want to import.

allow_multi_format: enables import of partitioned tables with different storage formats used. WARNING: this may fail on out-of-memory for tables with a large number of small partitions.

Details

For example,

```r
my_citibike_data = h2o.import_hive_table("default", "citibike20k", partitions = list(c("2017", "01"), c("2017", "02")))
my_citibike_data = h2o.import_hive_table("jdbc:hive2://hive-server:10000/default", "citibike20k", allow_multi_format = TRUE)
```

---

### h2o.import_mojo

Imports a MOJO under given path, creating a Generic model with it.

**Description**

Usage example: `mojo_model <- h2o.import_mojo(model_file_path = "/path/to/mojo.zip") predictions <- h2o.predict(mojo_model, dataset)`

**Usage**

```r
h2o.import_mojo(mojo_file_path)
```

**Arguments**

mojo_file_path: Filesystem path to the model imported

**Value**

Returns H2O Generic Model embedding given MOJO model
Examples

## Not run:

# Import default Iris dataset as H2O frame
data <- as.h2o(iris)

# Train a very simple GBM model
original_model <- h2o.gbm(x = features, y = "Species", training_frame = data)

# Download the trained GBM model as MOJO (temporary directory used in this example)
mojo_original_path <- h2o.save_mojo(original_model, path = tempdir())

# Import the MOJO and obtain a Generic model
mojo_model <- h2o.import_mojo(mojo_original_path)

# Perform scoring with the generic model
predictions <- h2o.predict(mojo_model, data)

## End(Not run)

---

**h2o.import_sql_select**

Import SQL table that is result of SELECT SQL query into H2O

---

**Description**

Creates a temporary SQL table from the specified sql_query. Runs multiple SELECT SQL queries on the temporary table concurrently for parallel ingestion, then drops the table. Be sure to start the h2o.jar in the terminal with your downloaded JDBC driver in the classpath: `java -cp <path_to_h2o_jar>:<path_to_jdbc_driver_jar>` water.H2OApp` Also see h2o.import_sql_table. Currently supported SQL databases are MySQL, PostgreSQL, MariaDB, Hive, Oracle and Microsoft SQL Server.

**Usage**

```r
h2o.import_sql_select(
  connection_url,
  select_query,
  username,
  password,
  use_temp_table = NULL,
  temp_table_name = NULL,
  optimize = NULL,
  fetch_mode = NULL
)
```
h2o.import_sql_table

Arguments

- **connection_url**: URL of the SQL database connection as specified by the Java Database Connectivity (JDBC) Driver. For example, "jdbc:mysql://localhost:3306/menagerie?&useSSL=false"
- **select_query**: SQL query starting with 'SELECT' that returns rows from one or more database tables.
- **username**: Username for SQL server
- **password**: Password for SQL server
- **use_temp_table**: Whether a temporary table should be created from select_query
- **temp_table_name**: Name of temporary table to be created from select_query
- **optimize**: (Optional) Optimize import of SQL table for faster imports. Experimental. Default is true.
- **fetch_mode**: (Optional) Set to DISTRIBUTED to enable distributed imports. Set to SINGLE to force a sequential read from the database Can be used for databases that do not support OFFSET-like clauses in SQL statements.

Details

For example, my_sql_conn_url <- "jdbc:mysql://172.16.2.178:3306/ingestSQL?&useSSL=false" select_query <- "SELECT bikeid from citibike20k" username <- "root" password <- "abc123" my_citibike_data <- h2o.import_sql_select(my_sql_conn_url, select_query, username, password)
Arguments

- **connection_url**: URL of the SQL database connection as specified by the Java Database Connectivity (JDBC) Driver. For example, "jdbc:mysql://localhost:3306/menagerie?useSSL=false"
- **table**: Name of SQL table
- **username**: Username for SQL server
- **password**: Password for SQL server
- **columns**: (Optional) Character vector of column names to import from SQL table. Default is to import all columns.
- **optimize**: (Optional) Optimize import of SQL table for faster imports. Default is true. Ignored - use fetch_mode instead.
- **fetch_mode**: (Optional) Set to DISTRIBUTED to enable distributed import. Set to SINGLE to force a sequential read from the database. Can be used for databases that do not support OFFSET-like clauses in SQL statements.

Details

For example, my_sql_conn_url <- "jdbc:mysql://172.16.2.178:3306/ingestSQL?useSSL=false"
table <- "citibike20k" username <- "root" password <- "abc123" my_citibike_data <- h2o.import_sql_table(my_sql_conn_url, table, username, password)

---

### h2o.impute

**Basic Imputation of H2O Vectors**

**Description**

Perform inplace imputation by filling missing values with aggregates computed on the "na.rm'd" vector. Additionally, it's possible to perform imputation based on groupings of columns from within data; these columns can be passed by index or name to the by parameter. If a factor column is supplied, then the method must be "mode".

**Usage**

```r
h2o.impute(
data,
column = 0,
method = c("mean", "median", "mode"),
combine_method = c("interpolate", "average", "lo", "hi"),
by = NULL,
groupByFrame = NULL,
values = NULL
)
```
Arguments

data: The dataset containing the column to impute.

column: A specific column to impute, default of 0 means impute the whole frame.

method: "mean" replaces NAs with the column mean; "median" replaces NAs with the column median; "mode" replaces with the most common factor (for factor columns only);

combine_method: If method is "median", then choose how to combine quantiles on even sample sizes. This parameter is ignored in all other cases.

by: group by columns

groupByFrame: Impute the column col with this pre-computed grouped frame.

values: A vector of impute values (one per column). NaN indicates to skip the column

Details

The default method is selected based on the type of the column to impute. If the column is numeric then "mean" is selected; if it is categorical, then "mode" is selected. Other column types (e.g. String, Time, UUID) are not supported.

Value

an H2OFrame with imputed values

Examples

```r
## Not run:
h2o.init()
iris_hf <- as.h2o(iris)
iris_hf[sample(nrow(iris_hf), 40), 5] <- NA  # randomly replace 50 values with NA
# impute with a group by
iris_hf <- h2o.impute(iris_hf, "Species", "mode", by = c("Sepal.Length", "Sepal.Width"))
## End(Not run)
```

h2o.init

Initialize and Connect to H2O

Description

Attempts to start and/or connect to and H2O instance.
Usage

```r
h2o.init(
  ip = "localhost",
  port = 54321,
  name = NA_character_,
  startH2O = TRUE,
  forceDL = FALSE,
  enable_assertions = TRUE,
  license = NULL,
  nthreads = -1,
  max_mem_size = NULL,
  min_mem_size = NULL,
  ice_root = tempdir(),
  log_dir = NA_character_,
  log_level = NA_character_,
  strict_version_check = TRUE,
  proxy = NA_character_,
  https = FALSE,
  cacert = NA_character_,
  insecure = FALSE,
  username = NA_character_,
  password = NA_character_,
  use_spnego = FALSE,
  cookies = NA_character_,
  context_path = NA_character_,
  ignore_config = FALSE,
  extra_classpath = NULL,
  jvm_custom_args = NULL,
  bind_to_localhost = TRUE
)
```

Arguments

- `ip` Object of class `character` representing the IP address of the server where H2O is running.
- `port` Object of class `numeric` representing the port number of the H2O server.
- `name` (Optional) A `character` string representing the H2O cluster name.
- `startH2O` (Optional) A `logical` value indicating whether to try to start H2O from R if no connection with H2O is detected. This is only possible if `ip = "localhost"` or `ip = "127.0.0.1"`. If an existing connection is detected, R does not start H2O.
- `forceDL` (Optional) A `logical` value indicating whether to force download of the H2O executable. Defaults to `FALSE`, so the executable will only be downloaded if it does not already exist in the h2o R library resources directory `h2o/java/h2o.jar`. This value is only used when R starts H2O.
- `enable_assertions` (Optional) A `logical` value indicating whether H2O should be launched with assertions enabled. Used mainly for error checking and debugging purposes.
This value is only used when R starts H2O.

`license` (Optional) A character string value specifying the full path of the license file. This value is only used when R starts H2O.

`nthreads` (Optional) Number of threads in the thread pool. This relates very closely to the number of CPUs used. -1 means use all CPUs on the host (Default). A positive integer specifies the number of CPUs directly. This value is only used when R starts H2O.

`max_mem_size` (Optional) A character string specifying the maximum size, in bytes, of the memory allocation pool to H2O. This value must be a multiple of 1024 greater than 2MB. Append the letter m or M to indicate megabytes, or g or G to indicate gigabytes. This value is only used when R starts H2O. If `max_mem_size` is not defined, then the amount of memory that H2O allocates will be determined by the default memory of Java Virtual Machine. This amount is dependent on the Java version, but it will generally be 25 percent of the machine’s physical memory.

`min_mem_size` (Optional) A character string specifying the minimum size, in bytes, of the memory allocation pool to H2O. This value must be a multiple of 1024 greater than 2MB. Append the letter m or M to indicate megabytes, or g or G to indicate gigabytes. This value is only used when R starts H2O.

`ice_root` (Optional) A directory to handle object spillage. The default varies by OS.

`log_dir` (Optional) A directory where H2O server logs are stored. The default varies by OS.

`log_level` (Optional) The level of logging of H2O server. The default is INFO.

`strict_version_check` (Optional) Setting this to FALSE is unsupported and should only be done when advised by technical support.

`proxy` (Optional) A character string specifying the proxy path.

`https` (Optional) Set this to TRUE to use https instead of http.

`cacert` (Optional) Path to a CA bundle file with root and intermediate certificates of trusted CAs.

`insecure` (Optional) Set this to TRUE to disable SSL certificate checking.

`username` (Optional) Username to login with.

`password` (Optional) Password to login with.

`use_spnego` (Optional) Set this to TRUE to enable SPNEGO authentication.

`cookies` (Optional) Vector(or list) of cookies to add to request.

`context_path` (Optional) The last part of connection URL: http://<ip>:<port>/<context_path>

`ignore_config` (Optional) A logical value indicating whether a search for a .h2oconfig file should be conducted or not. Default value is FALSE.

`extra_classpath` (Optional) A vector of paths to libraries to be added to the Java classpath when H2O is started from R.
h2o.init

jvm_custom_args
(Optional) A character list of custom arguments for the JVM where new H2O instance is going to run, if started. Ignored when connecting to an existing instance.

bind_to_localhost
(Optional) A logical flag indicating whether access to the H2O instance should be restricted to the local machine (default) or if it can be reached from other computers on the network. Only applicable when H2O is started from R.

Details

By default, this method first checks if an H2O instance is connectible. If it cannot connect and `start = TRUE` with `ip = "localhost"`, it will attempt to start and instance of H2O at localhost:54321. If an open ip and port of your choice are passed in, then this method will attempt to start an H2O instance at that specified ip port.

When initializing H2O locally, this method searches for h2o.jar in the R library resources (`system.file("java","h2o.jar",package = "h2o")`), and if the file does not exist, it will automatically attempt to download the correct version from Amazon S3. The user must have Internet access for this process to be successful.

Once connected, the method checks to see if the local H2O R package version matches the version of H2O running on the server. If there is a mismatch and the user indicates she wishes to upgrade, it will remove the local H2O R package and download/install the H2O R package from the server.

Value

this method will load it and return a H2OConnection object containing the IP address and port number of the H2O server.

Note

Users may wish to manually upgrade their package (rather than waiting until being prompted), which requires that they fully uninstall and reinstall the H2O package, and the H2O client package. You must unload packages running in the environment before upgrading. It’s recommended that users restart R or R studio after upgrading

See Also

H2O R package documentation for more details. h2o.shutdown for shutting down from R.

Examples

## Not run:
# Try to connect to a local H2O instance that is already running.
# If not found, start a local H2O instance from R with the default settings.
h2o.init()

# Try to connect to a local H2O instance.
# If not found, raise an error.
h2o.init(startH2O = FALSE)

# Try to connect to a local H2O instance that is already running.
h2o.insertMissingValues

Insert Missing Values into an H2OFrame

Description

Randomly replaces a user-specified fraction of entries in an H2O dataset with missing values.

Usage

h2o.insertMissingValues(data, fraction = .1, seed = -1)

Arguments

data An H2OFrame object representing the dataset.

fraction A number between 0 and 1 indicating the fraction of entries to replace with missing.

seed A random number used to select which entries to replace with missing values. Default of seed = -1 will automatically generate a seed in H2O.

Value

Returns an H2OFrame object.

WARNING

This will modify the original dataset. Unless this is intended, this function should only be called on a subset of the original.

Examples

## Not run:
library(h2o)
h2o.init()

iris_hf <- as.h2o(iris)
summary(iris_hf)

iris_miss <- h2o.insertMissingValues(iris_hf, fraction = 0.25)
h2o.interaction

head(iris_miss)
summary(iris_miss)

## End(Not run)

---

h2o.interaction  Categorical Interaction Feature Creation in H2O

### Description

Creates a data frame in H2O with n-th order interaction features between categorical columns, as specified by the user.

### Usage

```r
h2o.interaction(
  data,  
  destination_frame, 
  factors, 
  pairwise, 
  max_factors, 
  min_occurrence 
)
```

### Arguments

- **data**: An H2OFrame object containing the categorical columns.
- **destination_frame**: A string indicating the destination key. If empty, this will be auto-generated by H2O.
- **factors**: Factor columns (either indices or column names).
- **pairwise**: Whether to create pairwise interactions between factors (otherwise create one higher-order interaction). Only applicable if there are 3 or more factors.
- **max_factors**: Max. number of factor levels in pair-wise interaction terms (if enforced, one extra catch-all factor will be made).
- **min_occurrence**: Min. occurrence threshold for factor levels in pair-wise interaction terms

### Value

Returns an H2OFrame object.
Examples

```r
## Not run:
library(h2o)
h2o.init()

# Create some random data
my_frame <- h2o.createFrame(rows = 20, cols = 5,
    seed = -12301283, randomize = TRUE, value = 0,
    categorical_fraction = 0.8, factors = 10, real_range = 1,
    integer_fraction = 0.2, integer_range = 10,
    binary_fraction = 0, binary_ones_fraction = 0.5,
    missing_fraction = 0.2,
    response_factors = 1)

# Turn integer column into a categorical
my_frame[,5] <- as.factor(my_frame[,5])
head(my_frame, 20)

# Create pairwise interactions
pairwise <- h2o.interaction(my_frame,
    factors = list(c(1, 2), c("C2", "C3", "C4")),
    pairwise = TRUE, max_factors = 10, min_occurrence = 1)
head(pairwise, 20)

# Create 5-th order interaction
higherorder <- h2o.interaction(my_frame, factors = c(1, 2, 3, 4, 5),
    pairwise = FALSE, max_factors = 10000, min_occurrence = 1)
head(higherorder, 20)

# Limit the number of factors of the "categoricalized" integer column
# to at most 3 factors, and only if they occur at least twice
head(my_frame[,5], 20)

trim_integer_levels <- h2o.interaction(my_frame, factors = "C5", pairwise = FALSE, max_factors = 3,
    min_occurrence = 2)
head(trim_integer_levels, 20)

# Put all together
my_frame <- h2o.cbind(my_frame, pairwise, higherorder, trim_integer_levels)
my_frame
head(my_frame, 20)
summary(my_frame)

## End(Not run)
```

h2o.isax iSAX

Description

Compute the iSAX index for a DataFrame which is assumed to be numeric time series data
Usage

```r
h2o.isax(x, num_words, max_cardinality, optimize_card = FALSE)
```

Arguments

- **x**: an H2OFrame
- **num_words**: Number of iSAX words for the timeseries. i.e. granularity along the time series
- **max_cardinality**: Maximum cardinality of the iSAX word. Each word can have less than the max
- **optimize_card**: An optimization flag that will find the max cardinality regardless of what is passed in for max_cardinality.

Value

An H2OFrame with the name of time series, string representation of iSAX word, followed by binary representation

References

Examples

```r
## Not run:
library(h2o)
h2o.init()
df <- h2o.createFrame(rows = 1, cols = 256, randomize = TRUE, value = 0,
real_range = 100, categorical_fraction = 0, factors = 0,
integer_fraction = 0, integer_range = 100, binary_fraction = 0,
binary_ones_fraction = 0, time_fraction = 0, string_fraction = 0,
missing_fraction = 0, has_response = FALSE, seed = 123)
df2 <- h2o.cumsum(df, axis = 1)
h2o.isax(df2, num_words = 10, max_cardinality = 10)

## End(Not run)
```

---

### h2o.ischaracter

**Check if character**

**Description**

Check if character

**Usage**

```r
h2o.ischaracter(x)
```
Arguments

x  An H2OFrame object.

See Also

class for the base R implementation, is.class().

Examples

## Not run:
library(h2o)
h2o.init()

iris <- h2o.importFile(f)
iris_char <- h2o.ascharacter(iris["class"])
h2o.ischaracter(iris_char)

## End(Not run)

h2o.isfactor  Check if factor

Description

Check if factor

Usage

h2o.isfactor(x)

Arguments

x  An H2OFrame object.

See Also

factor for the base R implementation, is.factor().

Examples

## Not run:
library(h2o)
h2o.init()

cars <- h2o.importFile(f)
cars["economy_20mpg"] <- as.factor(cars["economy_20mpg"])
h2o.isfactor(cars["economy_20mpg"])

h2o.isnumeric  

Description

Check if numeric

Usage

h2o.isnumeric(x)

Arguments

x  
An H2OFrame object.

See Also

numeric for the base R implementation, is.numeric().

Examples

## Not run:
library(h2o)
h2o.init()

iris <- h2o.importFile(f)
h2o.isnumeric(iris["sepal_len"])

## End(Not run)

h2o.isolationForest  

Description

Trains an Isolation Forest model
Usage

```r
h2o.isolationForest(
    training_frame,
    x,
    model_id = NULL,
    score_each_iteration = FALSE,
    score_tree_interval = 0,
    ignore_const_cols = TRUE,
    ntrees = 50,
    max_depth = 8,
    min_rows = 1,
    max_runtime_secs = 0,
    seed = -1,
    build_tree_one_node = FALSE,
    mtries = -1,
    sample_size = 256,
    sample_rate = -1,
    col_sample_rate_change_per_level = 1,
    col_sample_rate_per_tree = 1,
    categorical_encoding = c("AUTO", "Enum", "OneHotInternal", "OneHotExplicit",
                              "Binary", "Eigen", "LabelEncoder", "SortByResponse", "EnumLimited"),
    stopping_rounds = 0,
    stopping_metric = c("AUTO", "anomaly_score"),
    stopping_tolerance = 0.01,
    export_checkpoints_dir = NULL,
    contamination = -1,
    validation_frame = NULL,
    validation_response_column = NULL
)
```

Arguments

- **training_frame**  Id of the training data frame.
- **x**  A vector containing the character names of the predictors in the model.
- **model_id**  Destination id for this model; auto-generated if not specified.
- **score_each_iteration**  Logical. Whether to score during each iteration of model training. Defaults to FALSE.
- **score_tree_interval**  Score the model after every so many trees. Disabled if set to 0. Defaults to 0.
- **ignore_const_cols**  Logical. Ignore constant columns. Defaults to TRUE.
- **ntrees**  Number of trees. Defaults to 50.
- **max_depth**  Maximum tree depth (0 for unlimited). Defaults to 8.
- **min_rows**  Fewest allowed (weighted) observations in a leaf. Defaults to 1.
max_runtime_secs
Maximum allowed runtime in seconds for model training. Use 0 to disable. Defaults to 0.

seed
Seed for random numbers (affects certain parts of the algo that are stochastic and those might or might not be enabled by default). Defaults to -1 (time-based random number).

build_tree_one_node
Logical. Run on one node only; no network overhead but fewer cpus used. Suitable for small datasets. Defaults to FALSE.

mtries
Number of variables randomly sampled as candidates at each split. If set to -1, defaults (number of predictors)/3. Defaults to -1.

sample_size
Number of randomly sampled observations used to train each Isolation Forest tree. Only one of parameters sample_size and sample_rate should be defined. If sample_rate is defined, sample_size will be ignored. Defaults to 256.

sample_rate
Rate of randomly sampled observations used to train each Isolation Forest tree. Needs to be in range from 0.0 to 1.0. If set to -1, sample_rate is disabled and sample_size will be used instead. Defaults to -1.

col_sample_rate_change_per_level
Relative change of the column sampling rate for every level (must be > 0.0 and <= 2.0) Defaults to 1.

col_sample_rate_per_tree
Column sample rate per tree (from 0.0 to 1.0) Defaults to 1.

categorical_encoding
Encoding scheme for categorical features Must be one of: "AUTO", "Enum", "OneHotInternal", "OneHotExplicit", "Binary", "Eigen", "LabelEncoder", "SortByResponse", "EnumLimited". Defaults to AUTO.

stopping_rounds
Early stopping based on convergence of stopping_metric. Stop if simple moving average of length k of the stopping_metric does not improve for k:=stopping_rounds scoring events (0 to disable) Defaults to 0.

stopping_metric
Metric to use for early stopping (AUTO: logloss for classification, deviance for regression and anomaly_score for Isolation Forest). Note that custom and custom_increasing can only be used in GBM and DRF with the Python client. Must be one of: "AUTO", "anomaly_score". Defaults to AUTO.

stopping_tolerance
Relative tolerance for metric-based stopping criterion (stop if relative improvement is not at least this much) Defaults to 0.01.

export_checkpoints_dir
Automatically export generated models to this directory.

contamination
Contamination ratio - the proportion of anomalies in the input dataset. If undefined (-1) the predict function will not mark observations as anomalies and only anomaly score will be returned. Defaults to -1 (undefined). Defaults to -1.

validation_frame
Id of the validation data frame.
validation_response_column
(experimental) Name of the response column in the validation frame. Response column should be binary and indicate not anomaly/anomaly.

Examples

```r
## Not run:
library(h2o)
h2o.init()

# Import the cars dataset
cars <- h2o.importFile(f)

# Set the predictors
predictors <- c("displacement", "power", "weight", "acceleration", "year")

# Train the IF model
cars_if <- h2o.isolationForest(x = predictors, training_frame = cars,
   seed = 1234, stopping_metric = "anomaly_score",
   stopping_rounds = 3, stopping_tolerance = 0.1)

## End(Not run)
```

---

h2o.is_client

Check Client Mode Connection

Description

Check Client Mode Connection

Usage

h2o.is_client()

---

h2o.keyof

Method on Keyed objects allowing to obtain their key.

Description

Method on Keyed objects allowing to obtain their key.
**Usage**

```r
h2o.keyof(object)
```

## S4 method for signature 'Keyed'

```r
h2o.keyof(object)
```

## S4 method for signature 'H2OModel'

```r
h2o.keyof(object)
```

## S4 method for signature 'H2OGrid'

```r
h2o.keyof(object)
```

## S4 method for signature 'H2OFrame'

```r
h2o.keyof(object)
```

## S4 method for signature 'H2OAutoML'

```r
h2o.keyof(object)
```

**Arguments**

- `object` A Keyed object

**Value**

the string key holding the persistent object.

---

**Description**

Create a k-fold vector useful for H2O algorithms that take a fold_assignments argument.

**Usage**

```r
h2o.kfold_column(data, nfolds, seed = -1)
```

**Arguments**

- `data` A dataframe against which to create the fold column.
- `nfolds` The number of desired folds.
- `seed` A random seed, -1 indicates that H2O will choose one.

**Value**

Returns an H2OFrame object with fold assignments.
## Not run:
library(h2o)
h2o.init()

iris <- h2o.importFile(f)
kfolds <- h2o.kfold_column(iris, nfolds = 5, seed = 1234)

## End(Not run)

---

### h2o.killMinus3

**Dump the stack into the JVM’s stdout.**

### Description

A poor man’s profiler, but effective.

### Usage

h2o.killMinus3()

---

### h2o.kmeans

**Performs k-means clustering on an H2O dataset**

### Description

Performs k-means clustering on an H2O dataset

### Usage

h2o.kmeans(
  training_frame,
  x,
  model_id = NULL,
  validation_frame = NULL,
  nfolds = 0,
  keep_cross_validation_models = TRUE,
  keep_cross_validation_predictions = FALSE,
  keep_cross_validation_fold_assignment = FALSE,
  fold_assignment = c("AUTO", "Random", "Modulo", "Stratified"),
  fold_column = NULL,
  ignore_const_cols = TRUE,
  score_each_iteration = FALSE,
  k = 1,
  estimate_k = FALSE,
user_points = NULL,
max_iterations = 10,
standardize = TRUE,
seed = -1,
init = c("Random", "PlusPlus", "Furthest", "User"),
max_runtime_secs = 0,
categorical_encoding = c("AUTO", "Enum", "OneHotInternal", "OneHotExplicit", 
"Binary", "Eigen", "LabelEncoder", "SortByResponse", "EnumLimited"),
export_checkpoints_dir = NULL,
cluster_size_constraints = NULL
)

Arguments

training_frame  Id of the training data frame.
x A vector containing the character names of the predictors in the model.
model_id Destination id for this model; auto-generated if not specified.
validation_frame Id of the validation data frame.
nfolds Number of folds for K-fold cross-validation (0 to disable or >= 2). Defaults to 0.
keep_cross_validation_models Logical. Whether to keep the cross-validation models. Defaults to TRUE.
keep_cross_validation_predictions Logical. Whether to keep the predictions of the cross-validation models. Defaults to FALSE.
keep_cross_validation_fold_assignment Logical. Whether to keep the cross-validation fold assignment. Defaults to FALSE.
fold_assignment Cross-validation fold assignment scheme, if fold_column is not specified. The 'Stratified' option will stratify the folds based on the response variable, for classification problems. Must be one of: "AUTO", "Random", "Modulo", "Stratified". Defaults to AUTO.
fold_column Column with cross-validation fold index assignment per observation.
ignore_const_cols Logical. Ignore constant columns. Defaults to TRUE.
score_each_iteration Logical. Whether to score during each iteration of model training. Defaults to FALSE.
k The max. number of clusters. If estimate_k is disabled, the model will find k centroids, otherwise it will find up to k centroids. Defaults to 1.
estimate_k Logical. Whether to estimate the number of clusters (<=k) iteratively and deterministically. Defaults to FALSE.
user_points This option allows you to specify a dataframe, where each row represents an initial cluster center. The user-specified points must have the same number of columns as the training observations. The number of rows must equal the number of clusters.

max_iterations Maximum training iterations (if estimate_k is enabled, then this is for each inner Lloyds iteration) Defaults to 10.

standardize Logical. Standardize columns before computing distances. Defaults to TRUE.

seed Seed for random numbers (affects certain parts of the algo that are stochastic and those might or might not be enabled by default). Defaults to -1 (time-based random number).

max_runtime_secs Maximum allowed runtime in seconds for model training. Use 0 to disable. Defaults to 0.

categorical_encoding Encoding scheme for categorical features. Must be one of: "AUTO", "Enum", "OneHotInternal", "OneHotExplicit", "Binary", "Eigen", "LabelEncoder", "Sort-ByResponse", "EnumLimited". Defaults to AUTO.

export_checkpoints_dir Automatically export generated models to this directory.

cluster_size_constraints An array specifying the minimum number of points that should be in each cluster. The length of the constraints array has to be the same as the number of clusters.

Value

an object of class H2OClusteringModel.

See Also

h2o.cluster_sizes, h2o.totss, h2o.num_iterations, h2o.betweenss, h2o.tot_withinss, h2o.withinss, h2o.centersSTD, h2o.centers

Examples

```r
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
h2o.kmeans(training_frame = prostate, k = 10, x = c("AGE", "RACE", "VOL", "GLEASON"))
```

```r
## End(Not run)
```
Description

Retrieves a Kolmogorov-Smirnov metric for given binomial model. The number returned is in range between 0 and 1. K-S metric represents the degree of separation between the positive (1) and negative (0) cumulative distribution functions. Detailed metrics per each group are to be found in the gains-lift table.

Usage

```r
h2o.kolmogorov_smirnov(object)
```

Arguments

- `object`
  
  Either an `H2OModel` object or an `H2OModelMetrics` object.

Details

The `H2OModelMetrics` version of this function will only take `H2OBinomialMetrics` objects.

Value

Kolmogorov-Smirnov metric, a number between 0 and 1.

See Also

- `h2o.gainsLift` to see detailed K-S metrics per group

Examples

```r
## Not run:
library(h2o)
h2o.init()
data <- h2o.importFile(
path = "https://s3.amazonaws.com/h2o-public-test-data/smalldata/airlines/allyears2k_headers.zip")
model <- h2o.gbm(x = c("Origin", "Distance"), y = "IsDepDelayed",
training_frame = data, ntrees = 1)
h2o.kolmogorov_smirnov(model)
## End(Not run)
```
h2o.kurtosis

Kurtosis of a column

Description

Obtain the kurtosis of a column of a parsed H2O data object.

Usage

h2o.kurtosis(x, ..., na.rm = TRUE)

kurtosis.H2OFrame(x, ..., na.rm = TRUE)

Arguments

x

An H2OFrame object.

...  

Further arguments to be passed from or to other methods.

na.rm

A logical value indicating whether NA or missing values should be stripped before the computation.

Value

Returns a list containing the kurtosis for each column (NaN for non-numeric columns).

Examples

## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
h2o.kurtosis(prostate$AGE)

## End(Not run)

h2o.learning_curve_plot

Learning Curve Plot

Description

Create learning curve plot for an H2O Model. Learning curves show error metric dependence on learning progress, e.g., RMSE vs number of trees trained so far in GBM. There can be up to 4 curves showing Training, Validation, Training on CV Models, and Cross-validation error.
Usage

```r
h2o.learning_curve_plot(
    model,
    metric = c("AUTO", "auc", "aucpr", "mae", "rmse", "anomaly_score", "convergence",
               "custom", "custom_increasing", "deviance", "lift_top_group", "logloss",
               "misclassification", "negative_log_likelihood", "objective", "summetaeta02"),
    cv_ribbon = NULL,
    cv_lines = NULL
)
```

Arguments

- **model**: an H2O model
- **metric**: Metric to be used for the learning curve plot. These should mostly correspond with stopping metric.
- **cv_ribbon**: if True, plot the CV mean as a and CV standard deviation as a ribbon around the mean, if NULL, it will attempt to automatically determine if this is suitable visualisation
- **cv_lines**: if True, plot scoring history for individual CV models, if NULL, it will attempt to automatically determine if this is suitable visualisation

Value

A `ggplot2` object

Examples

```r
## Not run:
library(h2o)
h2o.init()

# Import the wine dataset into H2O:
df <- h2o.importFile(f)

# Set the response
response <- "quality"

# Split the dataset into a train and test set:
splits <- h2o.splitFrame(df, ratios = 0.8, seed = 1)
train <- splits[[1]]
test <- splits[[2]]

# Build and train the model:
gbm <- h2o.gbm(y = response,
               training_frame = train)

# Create the learning curve plot
learning_curve <- h2o.learning_curve_plot(gbm)
print(learning_curve)
```
h2o.levels

Return the levels from the column requested column.

Description

Return the levels from the column requested column.

Usage

h2o.levels(x, i)

Arguments

x    An H2OFrame object.
i    Optional, the index of the column whose domain is to be returned.

See Also

levels for the base R method.

Examples

## Not run:
library(h2o)
h2o.init()

iris_hf <- as.h2o(iris)
h2o.levels(iris_hf, 5)  # returns "setosa"  "versicolor"  "virginica"

## End(Not run)

h2o.listTimezones

List all of the Time Zones Acceptable by the H2O cluster.

Description

List all of the Time Zones Acceptable by the H2O cluster.

Usage

h2o.listTimezones()
h2o.list_all_extensions

List all H2O registered extensions

Description
List all H2O registered extensions

Usage
h2o.list_all_extensions()

h2o.list_api_extensions

List registered API extensions

Description
List registered API extensions

Usage
h2o.list_api_extensions()

h2o.list_core_extensions

List registered core extensions

Description
List registered core extensions

Usage
h2o.list_core_extensions()
h2o.list_jobs  

Return list of jobs performed by the H2O cluster

Description

Return list of jobs performed by the H2O cluster

Usage

h2o.list_jobs()

h2o.list_models  

Get an list of all model ids present in the cluster

Description

Get an list of all model ids present in the cluster

Usage

h2o.list_models()

Value

Returns a vector of model ids.

Examples

```r
## Not run:
library(h2o)
h2o.init()

iris_hf <- as.h2o(iris)
model_id <- h2o.gbm(x = 1:4, y = 5, training_frame = iris_hf)@model_id
model_id_list <- h2o.list_models()

## End(Not run)
```
h2o.loadGrid

Loads previously saved grid with all it’s models from the same folder

Description

Returns a reference to the loaded Grid.

Usage

h2o.loadGrid(grid_path, load_params_references = FALSE)

Arguments

grid_path
   A character string containing the path to the file with the grid saved.
load_params_references
   A logical which if true will attempt to reload saved objects referenced by grid
   parameters (e.g. training frame, calibration frame), will fail if grid was saved
   without referenced objects.

Examples

## Not run:
library(h2o)
h2o.init()
iris <- as.h2o(iris)
ntrees_opts = c(1, 5)
learn_rate_opts = c(0.1, 0.01)
size_of_hyper_space = length(ntrees_opts) * length(learn_rate_opts)

hyper_parameters = list(ntrees = ntrees_opts, learn_rate = learn_rate_opts)
# Tempdir is chosen arbitrarily. May be any valid folder on an H2O-supported filesystem.
baseline_grid <- h2o.grid("gbm", grid_id="gbm_grid_test", x=1:4, y=5, training_frame=iris,
hyper_params = hyper_parameters, export_checkpoints_dir = tempdir())
# Remove everything from the cluster or restart it
h2o.removeAll()
grid <- h2o.loadGrid(paste0(tempdir(), "/", baseline_grid@grid_id))

## End(Not run)
**h2o.loadModel**  
*Load H2O Model from HDFS or Local Disk*

**Description**  
Load a saved H2O model from disk. (Note that ensemble binary models can now be loaded using this method.)

**Usage**  
```r  
h2o.loadModel(path)  
```

**Arguments**  
- `path` The path of the H2O Model to be imported.

**Value**  
Returns a `H2OModel` object of the class corresponding to the type of model loaded.

**See Also**  
- `h2o.saveModel`, `H2OModel`

**Examples**

```r  
## Not run:  
# library(h2o)  
# h2o.init()  
# prostate_path = system.file("extdata", "prostate.csv", package = "h2o")  
# prostate = h2o.importFile(path = prostate_path)  
# prostate_glm = h2o.glm(y = "CAPSULE", x = c("AGE", "RACE", "PSA", "DCAPS"),  
# training_frame = prostate, family = "binomial", alpha = 0.5)  
# glmmodel_path = h2o.saveModel(prostate_glm, dir = "/Users/UserName/Desktop")  
# glmmodel_load = h2o.loadModel(glmmodel_path)  
## End(Not run)  
```

---

**h2o.load_frame**  
*Load frame previously stored in H2O’s native format.*

**Description**  
Load frame previously stored in H2O’s native format.

**Usage**  
```r  
h2o.load_frame(frame_id, dir, force = TRUE)  
```
**Arguments**

- **frame_id**: the frame ID of the original frame
- **dir**: a filesystem location where to look for frame data
- **force**: logical, overwrite an already existing frame (defaults to true)

**Examples**

```r
## Not run:
library(h2o)
h2o.init()

prostate_path = system.file("extdata", "prostate.csv", package = "h2o")
prostate = h2o.importFile(path = prostate_path)
h2o.save_frame(prostate, "/tmp/prostate")
prostate.key <- h2o.getId(prostate)
h2o.rm(prostate)
prostate <- h2o.load_frame(prostate.key, "/tmp/prostate")

## End(Not run)
```

---

**h2o.log**

*Compute the logarithm of x*

**Description**

Compute the logarithm of x

**Usage**

`h2o.log(x)`

**Arguments**

- **x**: An H2OFrame object.

**See Also**

`Log` for the base R implementation, `log`.

**Examples**

```r
## Not run:
library(h2o)
h2o.init()

frame <- h2o.createFrame(rows = 6, cols = 2,
categorical_fraction = 0.0,
missing_fraction = 0.7,
```
h2o.log10

\textit{Compute the log10 of x}

\section*{Description}
Compute the log10 of x.

\section*{Usage}
\begin{verbatim}
  h2o.log10(x)
\end{verbatim}

\section*{Arguments}
\begin{itemize}
  \item \texttt{x}  An H2OFrame object.
\end{itemize}

\section*{See Also}
\begin{itemize}
  \item \texttt{Log} for the base R implementation, \texttt{log10()}.
\end{itemize}

\section*{Examples}
\begin{verbatim}
## Not run:
library(h2o)
h2o.init()

frame <- h2o.createFrame(rows = 6, cols = 2,
categorical_fraction = 0.0,
missing_fraction = 0.7,
seed = 123)

h2o.log10(frame)

## End(Not run)
\end{verbatim}
**h2o.log1p**

*Compute the log1p of x*

**Description**

Compute the log1p of x

**Usage**

```r
h2o.log1p(x)
```

**Arguments**

- **x**  
  An H2OFrame object.

**See Also**

Log for the base R implementation, log1p().

**Examples**

```r
## Not run:
library(h2o)
h2o.init()
frame <- h2o.createFrame(rows = 6, cols = 2,
categorical_fraction = 0.0,
missing_fraction = 0.7,
seed = 123)
h2o.log1p(frame)
## End(Not run)
```

---

**h2o.log2**

*Compute the log2 of x*

**Description**

Compute the log2 of x

**Usage**

```r
h2o.log2(x)
```

**Arguments**

- **x**  
  An H2OFrame object.
**h2o.logAndEcho**

Log a message on the server-side logs

**Description**

This is helpful when running several pieces of work one after the other on a single H2O cluster and you want to make a notation in the H2O server side log where one piece of work ends and the next piece of work begins.

**Usage**

```r
h2o.logAndEcho(message)
```

**Arguments**

- `message` A character string with the message to write to the log.

**Details**

h2o.logAndEcho sends a message to H2O for logging. Generally used for debugging purposes.

**Examples**

```r
## Not run:
library(h2o)
h2o.init()

frame <- h2o.createFrame(rows = 6, cols = 2,
categorical_fraction = 0.0,
missing_fraction = 0.7,
seed = 123)

h2o.log2(frame)

## End(Not run)
```
h2o.logloss

Retrieve the Log Loss Value

Description

Retrieves the log loss output for a H2OBinomialMetrics or H2OMultinomialMetrics object. If "train", "valid", and "xval" parameters are FALSE (default), then the training Log Loss value is returned. If more than one parameter is set to TRUE, then a named vector of Log Losses are returned, where the names are "train", "valid" or "xval".

Usage

h2o.logloss(object, train = FALSE, valid = FALSE, xval = FALSE)

Arguments

object a H2OModelMetrics object of the correct type.

train Retrieve the training Log Loss

valid Retrieve the validation Log Loss

xval Retrieve the cross-validation Log Loss

Examples

## Not run:
library(h2o)
h2o.init()

cars <- h2o.importFile(f)
cars["economy_20mpg"] <- as.factor(cars["economy_20mpg"])
predictors <- c("displacement", "power", "weight", "acceleration", "year")
response <- "economy_20mpg"
cars_splits <- h2o.splitFrame(data = cars, ratios = .8, seed = 1234)
train <- cars_splits[[1]]
valid <- cars_splits[[2]]
car_drf <- h2o.randomForest(x = predictors,
y = response,
training_frame = train,
validation_frame = valid)
h2o.logloss(car_drf, train = TRUE, valid = TRUE)

## End(Not run)
h2o.ls

List Keys on an H2O Cluster

Description

Accesses a list of object keys in the running instance of H2O.

Usage

h2o.ls()

Value

Returns a list of hex keys in the current H2O instance.

Examples

## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
h2o.ls()

## End(Not run)

h2o.lstrip

Strip set from left

Description

Return a copy of the target column with leading characters removed. The set argument is a string specifying the set of characters to be removed. If omitted, the set argument defaults to removing whitespace.

Usage

h2o.lstrip(x, set = " ")

Arguments

x The column whose strings should be lstrip-ed.
set string of characters to be removed
Examples

```r
## Not run:
library(h2o)
h2o.init()
string_to_lstrip <- as.h2o("1234567890")
lstrip_string <- h2o.lstrip(string_to_lstrip, "123") # Remove "123"

## End(Not run)
```

---

h2o.mae

**Retrieve the Mean Absolute Error Value**

Description

Retrieves the mean absolute error (MAE) value from an H2O model. If "train", "valid", and "xval" parameters are FALSE (default), then the training MAE value is returned. If more than one parameter is set to TRUE, then a named vector of MAEs are returned, where the names are "train", "valid" or "xval".

Usage

```r
h2o.mae(object, train = FALSE, valid = FALSE, xval = FALSE)
```

Arguments

- **object**: An `H2OModel` object.
- **train**: Retrieve the training MAE
- **valid**: Retrieve the validation set MAE if a validation set was passed in during model build time.
- **xval**: Retrieve the cross-validation MAE

Examples

```r
## Not run:
library(h2o)

h <- h2o.init()
fr <- as.h2o(iris)
m <- h2o.deeplearning(x = 2:5, y = 1, training_frame = fr)

h2o.mae(m)

## End(Not run)
```
h2o.makeGLMModel  
_Set betas of an existing H2O GLM Model_

**Description**

This function allows setting betas of an existing glm model.

**Usage**

```r
h2o.makeGLMModel(model, beta)
```

**Arguments**

- `model`: an H2OModel corresponding from a `h2o.glm` call.
- `beta`: a new set of betas (a named vector)

h2o.make_metrics  
_Create Model Metrics from predicted and actual values in H2O_

**Description**

Given predicted values (target for regression, class-1 probabilities or binomial or per-class probabilities for multinomial), compute a model metrics object

**Usage**

```r
h2o.make_metrics(
  predicted, 
  actuals, 
  domain = NULL, 
  distribution = NULL, 
  weights = NULL, 
  auc_type = "NONE"
)
```

**Arguments**

- `predicted`: An H2OFrame containing predictions
- `actuals`: An H2OFrame containing actual values
- `domain`: Vector with response factors for classification.
- `distribution`: Distribution for regression.
- `weights`: (optional) An H2OFrame containing observation weights.
- `auc_type`: (optional) For multinomial classification you have to specify which type of aggregated AUC/AUCPR will be used to calculate this metric.
h2o.match

Value
Returns an object of the H2OModelMetrics subclass.

Examples

```r
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
prostate$CAPSULE <- as.factor(prostate$CAPSULE)
prostate_gbm <- h2o.gbm(3:9, "CAPSULE", prostate)
pred <- h2o.predict(prostate_gbm, prostate)[, 3] ## class-1 probability
h2o.make_metrics(pred, prostate$CAPSULE)
## End(Not run)
```

h2o.match

Value Matching in H2O

Description

match and %in% return values similar to the base R generic functions.

Usage

```
h2o.match(x, table, nomatch = 0, incomparables = NULL)
match.H2OFrame(x, table, nomatch = 0, incomparables = NULL)
x %in% table
```

Arguments

- `x` a categorical vector from an H2OFrame object with values to be matched.
- `table` an R object to match `x` against.
- `nomatch` the value to be returned in the case when no match is found.
- `incomparables` a vector of values that cannot be matched. Any value in `x` matching a value in this vector is assigned the `nomatch` value.

Value

Returns a vector of the positions of (first) matches of its first argument in its second

See Also

- `match` for base R implementation.
Examples

## Not run:
```r
h2o.init()
iris_hf <- as.h2o(iris)
h2o.match(iris_hf[, 5], c("setosa", "versicolor"))
```
## End(Not run)

---

**h2o.max**

*Returns the maxima of the input values.*

Description

Returns the maxima of the input values.

Usage

```r
h2o.max(x, na.rm = FALSE)
```

Arguments

- `x` An H2OFrame object.
- `na.rm` logical. indicating whether missing values should be removed.

See Also

`Extremes` for the base R implementation, `max()`.

Examples

## Not run:
```r
library(h2o)
h2o.init()

iris <- h2o.importFile(f)
h2o.max(iris["petal_len"], na.rm = TRUE)
```
## End(Not run)
**h2o.mean**

`h2o.mean` is a function to compute the mean of a frame in `H2OFrame` by column (or by row). It can be used to calculate the mean of each column in a dataset, which is useful for summarizing data.

### Description

Compute the frame’s mean by-column (or by-row).

### Usage

```r
h2o.mean(x, na.rm = FALSE, axis = 0, return_frame = FALSE, ...)  
## S3 method for class 'H2OFrame'
mean(x, na.rm = FALSE, axis = 0, return_frame = FALSE, ...)
```

### Arguments

- **x**: An `H2OFrame` object.
- **na.rm**: logical. Indicate whether missing values should be removed.
- **axis**: integer. Indicate whether to calculate the mean down a column (0) or across a row (1). NOTE: This is only applied when `return_frame` is set to `TRUE`. Otherwise, this parameter is ignored.
- **return_frame**: logical. Indicate whether to return an H2O frame or a list. Default is `FALSE` (returns a list).
- **...**: Further arguments to be passed from or to other methods.

### Value

Returns a list containing the mean for each column (NaN for non-numeric columns) if `return_frame` is set to `FALSE`. If `return_frame` is set to `TRUE`, then it will return an H2O frame with means per column or row (depends on `axis` argument).

### See Also

- `Round` for base R implementation, `mean()` and `colSums` for the base R implementation, `colMeans()`.

### Examples

```r
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
# Default behavior. Will return list of means per column.
h2o.mean(prostate$AGE)
# return_frame set to TRUE. This will return an H2O Frame
# with mean per row or column (depends on axis argument)
```
h2o.mean(prostate, na.rm = TRUE, axis = 1, return_frame = TRUE)

## End(Not run)

h2o.mean_per_class_error

Retrieve the mean per class error

Description

Retrieves the mean per class error from an H2OBinomialMetrics. If "train", "valid", and "xval" parameters are FALSE (default), then the training mean per class error value is returned. If more than one parameter is set to TRUE, then a named vector of mean per class errors are returned, where the names are "train", "valid" or "xval".

Usage

h2o.mean_per_class_error(object, train = FALSE, valid = FALSE, xval = FALSE)

Arguments

object An H2OBinomialMetrics object.
train Retrieve the training mean per class error
valid Retrieve the validation mean per class error
xval Retrieve the cross-validation mean per class error

See Also

h2o.mse for MSE, and h2o.metric for the various threshold metrics. See h2o.performance for creating H2OModelMetrics objects.

Examples

## Not run:
library(h2o)
h2o.init()

prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(prostate_path)

prostate[, 2] <- as.factor(prostate[, 2])
model <- h2o.gbm(x = 3:9, y = 2, training_frame = prostate, distribution = "bernoulli")
perf <- h2o.performance(model, prostate)
h2o.mean_per_class_error(perf)
h2o.mean_per_class_error(model, train=TRUE)

## End(Not run)
h2o.mean_residual_deviance

*Retrieve the Mean Residual Deviance value*

**Description**

Retrieves the Mean Residual Deviance value from an H2O model. If "train", "valid", and "xval" parameters are FALSE (default), then the training Mean Residual Deviance value is returned. If more than one parameter is set to TRUE, then a named vector of Mean Residual Deviances are returned, where the names are "train", "valid" or "xval".

**Usage**

```
h2o.mean_residual_deviance(object, train = FALSE, valid = FALSE, xval = FALSE)
```

**Arguments**

- **object**: An H2OModel object.
- **train**: Retrieve the training Mean Residual Deviance
- **valid**: Retrieve the validation Mean Residual Deviance
- **xval**: Retrieve the cross-validation Mean Residual Deviance

**Examples**

```
## Not run:
library(h2o)

h <- h2o.init()
fr <- as.h2o(iris)
m <- h2o.deeplearning(x = 2:5, y = 1, training_frame = fr)
h2o.mean_residual_deviance(m)
## End(Not run)
```

---

h2o.median

*H2O Median*

**Description**

Compute the median of an H2OFrame.
Usage

h2o.median(x, na.rm = TRUE)

## S3 method for class 'H2OFrame'
median(x, na.rm = TRUE)

Arguments

x An H2OFrame object.
na.rm a logical, indicating whether na's are omitted.

Value

Returns a list containing the median for each column (NaN for non-numeric columns)

Examples

## Not run:
library(h2o)
h2o.init()

prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
h2o.median(prostate)

## End(Not run)

h2o.melt

Converts a frame to key-value representation while optionally skipping NA values. Inverse operation to h2o.pivot.

Description

Pivot the frame designated by the three columns: index, column, and value. Index and column should be of type enum, int, or time. For cases of multiple indexes for a column label, the aggregation method is to pick the first occurrence in the data frame

Usage

h2o.melt(
  x,
  id_vars,
  value_vars = NULL,
  var_name = "variable",
  value_name = "value",
  skipna = FALSE
)
**h2o.merge**

**Merge Two H2O Data Frames**

**Arguments**

- **x** an H2OFrame
- **id_vars** the columns used as identifiers
- **value_vars** what columns will be converted to key-value pairs (optional, if not specified complement to id_vars will be used)
- **var_name** name of the key-column (default: "variable")
- **value_name** name of the value-column (default: "value")
- **skipna** if enabled, do not include NAs in the result (default: FALSE)

**Value**

an unpivoted H2OFrame

**Description**

Merges two H2OFrame objects with the same arguments and meanings as merge() in base R. However, we do not support all=TRUE, all.x=TRUE and all.y=TRUE. The default method is auto and it will default to the radix method. The radix method will return the correct merge result regardless of duplicated rows in the right frame. In addition, the radix method can perform merge even if you have string columns in your frames. If there are duplicated rows in your right frame, they will not be included if you use the hash method. The hash method cannot perform merge if you have string columns in your left frame. Hence, we consider the radix method superior to the hash method and is the default method to use.

**Usage**

```r
h2o.merge(
  x,
  y,
  by = intersect(names(x), names(y)),
  by.x = by,
  by.y = by,
  all = FALSE,
  all.x = all,
  all.y = all,
  method = "auto"
)
```
Arguments

- **x, y**: H2OFrame objects
- **by**: columns used for merging by default the common names
- **by.x**: x columns used for merging by name or number
- **by.y**: y columns used for merging by name or number
- **all**: TRUE includes all rows in x and all rows in y even if there is no match to the other
- **all.x**: If all.x is true, all rows in the x will be included, even if there is no matching row in y, and vice-versa for all.y.
- **all.y**: see all.x
- **method**: auto(default), radix, hash

Examples

```r
## Not run:
library(h2o)
h2o.init()
left <- data.frame(fruit = c('apple', 'orange', 'banana', 'lemon', 'strawberry', 'blueberry'),
                   color = c('red', 'orange', 'yellow', 'yellow', 'red', 'blue'))
right <- data.frame(fruit = c('apple', 'orange', 'banana', 'lemon', 'strawberry', 'watermelon'),
                    citrus = c(FALSE, TRUE, FALSE, TRUE, FALSE, FALSE))
left_hf <- as.h2o(left)
right_hf <- as.h2o(right)
merged <- h2o.merge(left_hf, right_hf, all.x = TRUE)
## End(Not run)
```

---

### h2o.metric

**H2O Model Metric Accessor Functions**

**Description**

A series of functions that retrieve model metric details.

**Usage**

- `h2o.metric(object, thresholds, metric, transform = NULL)`
- `h2o.F0point5(object, thresholds)`
- `h2o.F1(object, thresholds)`
- `h2o.F2(object, thresholds)`
- `h2o.accuracy(object, thresholds)`
h2o.error(object, thresholds)
h2o.maxPerClassError(object, thresholds)
h2o.mean_per_class_accuracy(object, thresholds)
h2o.mcc(object, thresholds)
h2o.precision(object, thresholds)
h2o.tpr(object, thresholds)
h2o.fpr(object, thresholds)
h2o.fnr(object, thresholds)
h2o.tnr(object, thresholds)
h2o.recall(object, thresholds)
h2o.sensitivity(object, thresholds)
h2o.fallout(object, thresholds)
h2o.missrate(object, thresholds)
h2o.specificity(object, thresholds)

Arguments

object An H2OModelMetrics object of the correct type.
thresholds (Optional) A value or a list of values between 0.0 and 1.0. If not set, then all thresholds will be returned. If "max", then the threshold maximizing the metric will be used.
metric (Optional) the metric to retrieve. If not set, then all metrics will be returned.
transform (Optional) a list describing a transformer for the given metric, if any. e.g. transform=list(op=foo_fn, name="foo") will rename the given metric to "foo" and apply function foo_fn to the metric values.

Details

Many of these functions have an optional thresholds parameter. Currently only increments of 0.1 are allowed. If not specified, the functions will return all possible values. Otherwise, the function will return the value for the indicated threshold.

Currently, the these functions are only supported by H2OBinomialMetrics objects.
**h2o.min**

Returns the minima of the input values.

**Value**

Returns either a single value, or a list of values.

**See Also**

- `h2o.auc` for AUC,
- `h2o.giniCoef` for the GINI coefficient,
- `h2o.mse` for MSE.

**Examples**

```r
## Not run:
library(h2o)
h2o.init()

prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(prostate_path)

prostate$CAPSULE <- as.factor(prostate$CAPSULE)
model <- h2o.gbm(x = 3:9, y = 2, training_frame = prostate, distribution = "bernoulli")
perf <- h2o.performance(model, prostate)
h2o.F1(perf)
```

---

**Description**

Returns the minima of the input values.

**Usage**

```r
h2o.min(x, na.rm = FALSE)
```

**Arguments**

- `x` An H2OFrame object.
- `na.rm` logical, indicating whether missing values should be removed.

**See Also**

- `Extremes` for the base R implementation, `min()`.
Examples

```r
## Not run:
library(h2o)
h2o.init()

iris <- h2o.importFile(f)
h2o.min(iris["sepal_len"], na.rm = TRUE)

## End(Not run)
```

---

**h2o.mktime**

*Compute msec since the Unix Epoch*

### Description

Compute msec since the Unix Epoch

### Usage

```r
h2o.mktime(
  year = 1970,
  month = 0,
  day = 0,
  hour = 0,
  minute = 0,
  second = 0,
  msec = 0
)
```

### Arguments

- **year**: Defaults to 1970
- **month**: zero based (months are 0 to 11)
- **day**: zero based (days are 0 to 30)
- **hour**: hour
- **minute**: minute
- **second**: second
- **msec**: msec
Examples

```r
## Not run:
library(h2o)
h2o.init()

x = as.h2o(c(2018, 3, 2, 6, 32, 0, 0))
h2o.mktme(x)

## End(Not run)
```

---

**h2o.model_correlation_heatmap**

*Model Prediction Correlation Heatmap*

**Description**

This plot shows the correlation between the predictions of the models. For classification, frequency of identical predictions is used. By default, models are ordered by their similarity (as computed by hierarchical clustering).

**Usage**

```r
h2o.model_correlation_heatmap(
  object,
  newdata,
  top_n = 20,
  cluster_models = TRUE,
  triangular = TRUE
)
```

**Arguments**

- `object`: An H2OAutoML object or list of H2O models.
- `newdata`: An H2O Frame. Predictions from the models will be generated using this frame, so this should be a holdout set.
- `top_n`: Integer specifying the number models shown in the heatmap (used only with an AutoML object, and based on the leaderboard ranking. Defaults to 20.
- `cluster_models`: Logical. Order models based on their similarity. Defaults to TRUE.
- `triangular`: Logical. Print just the lower triangular part of correlation matrix. Defaults to TRUE.

**Value**

A ggplot2 object.
Examples

```r
## Not run:
library(h2o)
h2o.init()

# Import the wine dataset into H2O:
      df <- h2o.importFile(f)

# Set the response
response <- "quality"

# Split the dataset into a train and test set:
splits <- h2o.splitFrame(df, ratios = 0.8, seed = 1)
    train <- splits[[1]]
    test <- splits[[2]]

# Build and train the model:
aml <- h2o.automl(y = response,
       training_frame = train,
       max_models = 10,
       seed = 1)

# Create the model correlation heatmap
model_correlation_heatmap <- h2o.model_correlation_heatmap(aml, test)
print(model_correlation_heatmap)

## End(Not run)
```

---

**h2o.mojo_predict_csv**  
*H2O Prediction from R without having H2O running*

**Description**

Provides the method `h2o.mojo_predict_csv` with which you can predict a MOJO model from R.

**Usage**

```r
h2o.mojo_predict_csv(
    input_csv_path,
    mojo_zip_path,
    output_csv_path = NULL,
    genmodel_jar_path = NULL,
    classpath = NULL,
    java_options = NULL,
    verbose = F,
    setInvNumNA = F
)
```
Arguments

- **input_csv_path**: Path to input CSV file.
- **mojo_zip_path**: Path to MOJO zip downloaded from H2O.
- **output_csv_path**: Optional, path to the output CSV file with computed predictions. If NULL (default), then predictions will be saved as prediction.csv in the same folder as the MOJO zip.
- **genmodel_jar_path**: Optional, path to genmodel jar file. If NULL (default) then the h2o-genmodel.jar in the same folder as the MOJO zip will be used.
- **classpath**: Optional, specifies custom user defined classpath which will be used when scoring. If NULL (default) then the default classpath for this MOJO model will be used.
- **java_options**: Optional, custom user defined options for Java. By default `-Xmx4g -XX:ReservedCodeCacheSize=256m` is used.
- **verbose**: Optional, if TRUE, then additional debug information will be printed. FALSE by default.
- **setInvNumNA**: Optional, if TRUE, then for a string that cannot be parsed into a number an N/A value will be produced, if false the command will fail. FALSE by default.

Value

Returns a data.frame containing computed predictions.

---

h2o.mojo_predict_df  

**H2O Prediction from R without having H2O running**

Description

Provides the method h2o.mojo_predict_df with which you can predict a MOJO model from R.

Usage

```r
h2o.mojo_predict_df(
  frame,  
  mojo_zip_path,  
  genmodel_jar_path = NULL,  
  classpath = NULL,  
  java_options = NULL,  
  verbose = F,  
  setInvNumNA = F
)
```
### h2o.month

**Convert Milliseconds to Months in H2O Datasets**

**Description**

Converts the entries of an H2OFrame object from milliseconds to months (on a 1 to 12 scale).

**Usage**

```r
h2o.month(x)

month(x)
```

**Arguments**

- `x`: An H2OFrame object.

**Value**

An H2OFrame object containing the entries of `x` converted to months of the year.

**See Also**

- `h2o.year`
h2o.mse

Retrieves Mean Squared Error Value

Description

Retrieves the mean squared error value from an H2OModelMetrics object. If "train", "valid", and "xval" parameters are FALSE (default), then the training MSE value is returned. If more than one parameter is set to TRUE, then a named vector of MSEs are returned, where the names are "train", "valid" or "xval".

Usage

h2o.mse(object, train = FALSE, valid = FALSE, xval = FALSE)

Arguments

object An H2OModelMetrics object of the correct type.
train Retrieve the training MSE
valid Retrieve the validation MSE
xval Retrieve the cross-validation MSE

Details

This function only supports H2OBinomialMetrics, H2OMultinomialMetrics, and H2ORegressionMetrics objects.

See Also

h2o.auc for AUC, h2o.mse for MSE, and h2o.metric for the various threshold metrics. See h2o.performance for creating H2OModelMetrics objects.

Examples

```r
## Not run:
library(h2o)
h2o.init()

prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(prostate_path)

prostate[, 2] <- as.factor(prostate[, 2])
model <- h2o.gbm(x = 3:9, y = 2, training_frame = prostate, distribution = "bernoulli")
perf <- h2o.performance(model, prostate)
h2o.mse(perf)

## End(Not run)
```
Retrieves the PR AUC table from an H2OMultinomialMetrics. If "train", "valid", and "xval" parameters are FALSE (default), then the training PR AUC table is returned. If more than one parameter is set to TRUE, then a named vector of PR AUC tables are returned, where the names are "train", "valid" or "xval".

Usage

h2o.multinomial_aucpr_table(object, train = FALSE, valid = FALSE, xval = FALSE)

Arguments

object       An H2OMultinomialMetrics object.
train        Retrieve the training PR AUC table
valid        Retrieve the validation PR AUC table
xval         Retrieve the cross-validation PR AUC table

See Also

h2o.giniCoef for the Gini coefficient, h2o.mse for MSE, and h2o.metric for the various threshold metrics. See h2o.performance for creating H2OModelMetrics objects.

Examples

## Not run:
library(h2o)
h2o.init()

prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(prostate_path)

prostate[, 2] <- as.factor(prostate[, 2])
model <- h2o.gbm(x = 3:9, y = 2, training_frame = prostate, distribution = "bernoulli")
perf <- h2o.performance(model, prostate)
h2o.multinomial_aucpr_table(perf)

## End(Not run)
h2o.multinomial_auc_table

Retrieve the all AUC values in a table (One to Rest, One to One, macro and weighted average) for mutlinomial classification.

Description

Retrieves the AUC table from an H2OMultinomialMetrics. If "train", "valid", and "xval" parameters are FALSE (default), then the training AUC table is returned. If more than one parameter is set to TRUE, then a named vector of AUC tables are returned, where the names are "train", "valid" or "xval".

Usage

h2o.multinomial_auc_table(object, train = FALSE, valid = FALSE, xval = FALSE)

Arguments

object An H2OMultinomialMetrics object.

train Retrieve the training AUC table
valid Retrieve the validation AUC table
xval Retrieve the cross-validation AUC table

See Also

h2o.giniCoef for the Gini coefficient, h2o.mse for MSE, and h2o.metric for the various threshold metrics. See h2o.performance for creating H2OModelMetrics objects.

Examples

## Not run:
library(h2o)
h2o.init()

prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(prostate_path)

prostate[, 2] <- as.factor(prostate[, 2])
model <- h2o.gbm(x = 3:9, y = 2, training_frame = prostate, distribution = "bernoulli")
perf <- h2o.performance(model, prostate)
h2o.multinomial_auc_table(perf)

## End(Not run)
**h2o.nacnt**

*Count of NAs per column*

**Description**

Gives the count of NAs per column.

**Usage**

`h2o.nacnt(x)`

**Arguments**

- `x`  
  An H2OFrame object.

**Value**

Returns a list containing the count of NAs per column

**Examples**

```r
## Not run:
library(h2o)
h2o.init()
iris_hf <- as.h2o(iris)
h2o.nacnt(iris_hf) # should return all 0s
h2o.insertMissingValues(iris_hf)
h2o.nacnt(iris_hf)

## End(Not run)
```

**h2o.naiveBayes**

*Compute naive Bayes probabilities on an H2O dataset.*

**Description**

The naive Bayes classifier assumes independence between predictor variables conditional on the response, and a Gaussian distribution of numeric predictors with mean and standard deviation computed from the training dataset. When building a naive Bayes classifier, every row in the training dataset that contains at least one NA will be skipped completely. If the test dataset has missing values, then those predictors are omitted in the probability calculation during prediction.
h2o.naiveBayes(
  x,
  y,
  training_frame,
  model_id = NULL,
  nfolds = 0,
  seed = -1,
  fold_assignment = c("AUTO", "Random", "Modulo", "Stratified"),
  fold_column = NULL,
  keep_cross_validation_models = TRUE,
  keep_cross_validation_predictions = FALSE,
  keep_cross_validation_fold_assignment = FALSE,
  validation_frame = NULL,
  ignore_const_cols = TRUE,
  score_each_iteration = FALSE,
  balance_classes = FALSE,
  class_sampling_factors = NULL,
  max_after_balance_size = 5,
  laplace = 0,
  threshold = 0.001,
  min_sdev = 0.001,
  eps = 0,
  eps_sdev = 0,
  min_prob = 0.001,
  eps_prob = 0,
  compute_metrics = TRUE,
  max_runtime_secs = 0,
  export_checkpoints_dir = NULL,
  gainslift_bins = -1,
  auc_type = c("AUTO", "NONE", "MACRO_OVR", "WEIGHTED_OVR", "MACRO_OVO", "WEIGHTED_OVO")
)

Arguments

x (Optional) A vector containing the names or indices of the predictor variables to use in building the model. If x is missing, then all columns except y are used.

y The name or column index of the response variable in the data. The response must be either a numeric or a categorical/factor variable. If the response is numeric, then a regression model will be trained, otherwise it will train a classification model.

training_frame Id of the training data frame.

model_id Destination id for this model; auto-generated if not specified.

nfolds Number of folds for K-fold cross-validation (0 to disable or >= 2). Defaults to 0.
seed

Seed for random numbers (affects certain parts of the algo that are stochastic and those might or might not be enabled by default). Defaults to -1 (time-based random number).

fold_assignment

Cross-validation fold assignment scheme, if fold_column is not specified. The 'Stratified' option will stratify the folds based on the response variable, for classification problems. Must be one of: "AUTO", "Random", "Modulo", "Stratified". Defaults to AUTO.

fold_column

Column with cross-validation fold index assignment per observation.

keep_cross_validation_models

Logical. Whether to keep the cross-validation models. Defaults to TRUE.

keep_cross_validation_predictions

Logical. Whether to keep the predictions of the cross-validation models. Defaults to FALSE.

keep_cross_validation_fold_assignment

Logical. Whether to keep the cross-validation fold assignment. Defaults to FALSE.

validation_frame

Id of the validation data frame.

ignore_const_cols

Logical. Ignore constant columns. Defaults to TRUE.

score_each_iteration

Logical. Whether to score during each iteration of model training. Defaults to FALSE.

balance_classes

Logical. Balance training data class counts via over/under-sampling (for imbalanced data). Defaults to FALSE.

class_sampling_factors

Desired over/under-sampling ratios per class (in lexicographic order). If not specified, sampling factors will be automatically computed to obtain class balance during training. Requires balance_classes.

max_after_balance_size

Maximum relative size of the training data after balancing class counts (can be less than 1.0). Requires balance_classes. Defaults to 5.0.

laplace

Laplace smoothing parameter. Defaults to 0.

threshold

This argument is deprecated, use 'min_sdev' instead. The minimum standard deviation to use for observations without enough data. Must be at least 1e-10.

min_sdev

The minimum standard deviation to use for observations without enough data. Must be at least 1e-10.

eps

This argument is deprecated, use 'eps_sdev' instead. A threshold cutoff to deal with numeric instability, must be positive.

eps_sdev

A threshold cutoff to deal with numeric instability, must be positive.

min_prob

Min. probability to use for observations with not enough data.

eps_prob

Cutoff below which probability is replaced with min_prob.
compute_metrics
   Logical. Compute metrics on training data. Defaults to TRUE.

max_runtime_secs
   Maximum allowed runtime in seconds for model training. Use 0 to disable.
   Defaults to 0.

export_checkpoints_dir
   Automatically export generated models to this directory.

gainslift_bins
   Gains/Lift table number of bins. 0 means disabled. Default value -1 means
   automatic binning. Defaults to -1.

auc_type
   Set default multinomial AUC type. Must be one of: "AUTO", "NONE", "MACRO_OVR",
   "WEIGHTED_OVR", "MACRO_OVO", "WEIGHTED_OVO". Defaults to AUTO.

Value

   an object of class H2OBinomialModel if the response has two categorical levels, and H2OMultinomialModel
   otherwise.

Examples

   ## Not run:
   h2o.init()
   votes_path <- system.file("extdata", "housevotes.csv", package = "h2o")
   votes <- h2o.uploadFile(path = votes_path, header = TRUE)
   h2o.naiveBayes(x = 2:17, y = 1, training_frame = votes, laplace = 3)

   ## End(Not run)

h2o.names

Column names of an H2OFrame

Description

   Column names of an H2OFrame

Usage

   h2o.names(x)

Arguments

   x
       An H2OFrame object.

See Also

   names for the base R implementation.
Examples

## Not run:
library(h2o)
h2o.init()

iris <- h2o.importFile(f)
h2o.names(iris)

## End(Not run)

h2o.na_omit

Remove Rows With NAs

Description

Remove Rows With NAs

Usage

h2o.na_omit(object, ...)

Arguments

object H2OFrame object
...
Ignored

Value

Returns an H2OFrame object containing non-NA rows.

Examples

## Not run:
library(h2o)
h2o.init()

frame <- h2o.createFrame(rows = 6, cols = 2,
categorical_fraction = 0.0,
missing_fraction = 0.7,
seed = 123)

h2o.na_omit(frame)

## End(Not run)
h2o.nchar  

String length

**Description**

String length

**Usage**

h2o.nchar(x)

**Arguments**

x  The column whose string lengths will be returned.

**Examples**

```r
## Not run:
library(h2o)
h2o.init()
string_to_nchar <- as.h2o("r tutorial")
nchar_string <- h2o.nchar(string_to_nchar)
## End(Not run)
```

h2o.ncol  

Return the number of columns present in x.

**Description**

Return the number of columns present in x.

**Usage**

h2o.ncol(x)

**Arguments**

x  An H2OFrame object.

**See Also**

`nrow` for the base R implementation, `ncol()`.
Examples

```r
## Not run:
library(h2o)
h2o.init()

iris <- h2o.importFile(f)
h2o.ncol(iris)

## End(Not run)
```

---

**h2o.networkTest**

*View Network Traffic Speed*

**Description**

View speed with various file sizes.

**Usage**

```r
h2o.networkTest()
```

**Value**

Returns a table listing the network speed for 1B, 10KB, and 10MB.

---

**h2o.nlevels**

*Get the number of factor levels for this frame.*

**Description**

Get the number of factor levels for this frame.

**Usage**

```r
h2o.nlevels(x)
```

**Arguments**

- `x` An H2OFrame object.

**See Also**

`nlevels` for the base R method.
### Examples

```r
## Not run:
library(h2o)
h2o.init()

cars <- h2o.importFile(f)
h2o.nlevels(cars)

## End(Not run)
```

---

#### h2o.no_progress
*Disable Progress Bar*

#### Description

Disable Progress Bar

#### Usage

```r
h2o.no_progress()
```

#### Examples

```r
## Not run:
library(h2o)
h2o.init()
h2o.no_progress()

iris <- h2o.importFile(f)
iris["class"] <- as.factor(iris["class"])predictions <- c("sepal_len", "sepal_wid", "petal_len", "petal_wid")
splits <- h2o.splitFrame(iris, ratios = 0.8, seed = 1234)
train <- splits[[1]]
valid <- splits[[2]]

iris_km <- h2o.kmeans(x = predictors,
training_frame = train,
validation_frame = valid,
k = 10, estimate_k = TRUE,
standardize = FALSE, seed = 1234)

## End(Not run)
```
h2o.nrow

Return the number of rows present in x.

Description

Return the number of rows present in x.

Usage

h2o.nrow(x)

Arguments

x

An H2OFrame object.

See Also

nrow for the base R implementation.

Examples

## Not run:
library(h2o)
h2o.init()

cars <- h2o.importFile(f)
h2o.nrow(cars)

## End(Not run)

h2o.null_deviance

Retrieve the null deviance

Description

If "train", "valid", and "xval" parameters are FALSE (default), then the training null deviance value is returned. If more than one parameter is set to TRUE, then a named vector of null deviances are returned, where the names are "train", "valid" or "xval".

Usage

h2o.null_deviance(object, train = FALSE, valid = FALSE, xval = FALSE)
h2o.null_dof

Retrieve the null degrees of freedom

Description

If "train", "valid", and "xval" parameters are FALSE (default), then the training null degrees of freedom value is returned. If more than one parameter is set to TRUE, then a named vector of null degrees of freedom are returned, where the names are "train", "valid" or "xval".

Usage

h2o.null_dof(object, train = FALSE, valid = FALSE, xval = FALSE)

Arguments

object An H2OModel or H2OModelMetrics
train Retrieve the training null degrees of freedom
valid Retrieve the validation null degrees of freedom
xval Retrieve the cross-validation null degrees of freedom
Examples

```r
## Not run:
library(h2o)
h2o.init()

prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.importFile(prostate_path)
prostate[, 2] <- as.factor(prostate[, 2])
prostate_glm <- h2o.glm(y = "CAPSULE", x = c("AGE", "RACE", "PSA", "DCAPS"),
                        training_frame = prostate, family = "binomial",
                        nfolds = 0, alpha = 0.5, lambda_search = FALSE)
h2o.null_dof(prostate_glm, train = TRUE)

## End(Not run)
```

---

**h2o.num_iterations**

*Retrieve the number of iterations.*

**Description**

Retrieve the number of iterations.

**Usage**

```r
h2o.num_iterations(object)
```

**Arguments**

- `object` 
  
  An **H2OClusteringModel** object.

**Examples**

```r
## Not run:
library(h2o)
h2o.init()

prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.importFile(prostate_path)
prostate[, 2] <- as.factor(prostate[, 2])
prostate_glm <- h2o.glm(y = "CAPSULE", x = c("AGE", "RACE", "PSA", "DCAPS"),
                        training_frame = prostate, family = "binomial",
                        nfolds = 0, alpha = 0.5, lambda_search = FALSE)
h2o.null_dof(prostate_glm, train = TRUE)

## End(Not run)
```
h2o.num_valid_substrings

*Count of substrings >= 2 chars that are contained in file*

**Description**

Find the count of all possible substrings >= 2 chars that are contained in the specified line-separated text file.

**Usage**

```r
h2o.num_valid_substrings(x, path)
```

**Arguments**

- **x**
  - The column on which to calculate the number of valid substrings.
- **path**
  - Path to text file containing line-separated strings to be referenced.

h2o.openLog

*View H2O R Logs*

**Description**

Open existing logs of H2O R POST commands and error responses on local disk. Used primarily for debugging purposes.

**Usage**

```r
h2o.openLog(type)
```

**Arguments**

- **type**
  - Currently unimplemented.

**See Also**

- `h2o.startLogging`, `h2o.stopLogging`, `h2o.clearLog`
Examples

```r
## Not run:
h2o.init()

h2o.startLogging()
australia_path = system.file("extdata", "australia.csv", package = "h2o")
australia = h2o.importFile(path = australia_path)
h2o.stopLogging()

# Not run to avoid windows being opened during R CMD check
# h2o.openLog("Command")
# h2o.openLog("Error")

## End(Not run)
```

### h2o.parseRaw

#### H2O Data Parsing

**Description**

The second phase in the data ingestion step.

**Usage**

```r
h2o.parseRaw(
  data,
  pattern = "",  
  destination_frame = "", 
  header = NA,
  sep = "",  
  col.names = NULL,
  col.types = NULL,
  na.strings = NULL,
  blocking = FALSE,
  parse_type = NULL,
  chunk_size = NULL,
  decrypt_tool = NULL,
  skipped_columns = NULL,
  custom_non_data_line_markers = NULL,
  partition_by = NULL,
  quotechar = NULL,
  escapechar = ""
)
```

**Arguments**

- **data** An H2OFrame object to be parsed.
pattern  (Optional) Character string containing a regular expression to match file(s) in the folder.

destination_frame
  (Optional) The hex key assigned to the parsed file.

header  (Optional) A logical value indicating whether the first row is the column header. If missing, H2O will automatically try to detect the presence of a header.

sep  (Optional) The field separator character. Values on each line of the file are separated by this character. If sep = "", the parser will automatically detect the separator.

col.names  (Optional) An H2OFrame object containing a single delimited line with the column names for the file. If skipped_columns are specified, only list column names of columns that are not skipped.

col.types  (Optional) A vector specifying the types to attempt to force over columns. If skipped_columns are specified, only list column types of columns that are not skipped.

na.strings  (Optional) H2O will interpret these strings as missing.

blocking  (Optional) Tell H2O parse call to block synchronously instead of polling. This can be faster for small datasets but loses the progress bar.

parse_type  (Optional) Specify which parser type H2O will use. Valid types are "ARFF", "XLS", "CSV", "SVMLight"

chunk_size  size of chunk of (input) data in bytes

decrypt_tool  (Optional) Specify a Decryption Tool (key-reference acquired by calling h2o.decryptionSetup).

skipped_columns  a list of column indices to be excluded from parsing

custom_non_data_line_markers
  (Optional) If a line in imported file starts with any character in given string it will NOT be imported. Empty string means all lines are imported, NULL means that default behaviour for given format will be used

partition_by  (Optional) Names of the columns the persisted dataset has been partitioned by.

quotechar  A hint for the parser which character to expect as quoting character. None (default) means autodetection.

escapechar  (Optional) One ASCII character used to escape other characters.

Details

Parse the Raw Data produced by the import phase.

See Also

h2o.importFile, h2o.parseSetup
h2o.parseSetup

Get a parse setup back for the staged data.

Description
Get a parse setup back for the staged data.

Usage

h2o.parseSetup(
  data,
  pattern = "",  
  destination_frame = "", 
  header = NA,   
  sep = "", 
  col.names = NULL, 
  col.types = NULL, 
  na.strings = NULL, 
  parse_type = NULL, 
  chunk_size = NULL, 
  decrypt_tool = NULL, 
  skipped_columns = NULL, 
  custom_non_data_line_markers = NULL, 
  partition_by = NULL, 
  single_quotes = FALSE, 
  escapechar = ""
)

Arguments

data An H2OFrame object to be parsed.

pattern (Optional) Character string containing a regular expression to match file(s) in the folder.

destination_frame (Optional) The hex key assigned to the parsed file.

header (Optional) A logical value indicating whether the first row is the column header. If missing, H2O will automatically try to detect the presence of a header.

sep (Optional) The field separator character. Values on each line of the file are separated by this character. If sep = "", the parser will automatically detect the separator.

col.names (Optional) An H2OFrame object containing a single delimited line with the column names for the file. If skipped_columns are specified, only list column names of columns that are not skipped.

col.types (Optional) A vector specifying the types to attempt to force over columns. If skipped_columns are specified, only list column types of columns that are not skipped.
Partial dependence plot gives a graphical depiction of the marginal effect of a variable on the response. The effect of a variable is measured in change in the mean response. Note: Unlike randomForest’s partialPlot when plotting partial dependence the mean response (probabilities) is returned rather than the mean of the log class probability.

Usage

```r
h2o.partialPlot(
  object,
  data,
  cols,
  destination_key,
  nbins = 20,
  plot = TRUE,
  plot_stddev = TRUE,
  weight_column = -1,
  include_na = FALSE,
  user_splits = NULL,
  col_pairs_2dpdp = NULL,
  save_to = NULL,
  row_index = -1,
  targets = NULL
)
```
h2o.partialPlot

Arguments

- object: An H2OModel object.
- data: An H2OFrame object used for scoring and constructing the plot.
- cols: Feature(s) for which partial dependence will be calculated.
- destination_key: An key reference to the created partial dependence tables in H2O.
- nbins: Number of bins used. For categorical columns make sure the number of bins exceeds the level count. If you enable add_missing_NA, the returned length will be nbin+1.
- plot: A logical specifying whether to plot partial dependence table.
- plot_stddev: A logical specifying whether to add std err to partial dependence plot.
- weight_column: A string denoting which column of data should be used as the weight column.
- include_na: A logical specifying whether missing value should be included in the Feature values.
- user_splits: A two-level nested list containing user defined split points for pdp plots for each column. If there are two columns using user defined split points, there should be two lists in the nested list. Inside each list, the first element is the column name followed by values defined by the user.
- col_pairs_2dpdp: A two-level nested list like this: col_pairs_2dpdp = list(list("col1_name", "col2_name"), list("col1_name", "col3_name"), ...), where a 2D partial plots will be generated for col1_name, col2_name pair, for col1_name, col3_name pair and whatever other pairs that are specified in the nested list.
- save_to: Fully qualified prefix of the image files the resulting plots should be saved to, e.g. `/home/user/pdp`. Plots for each feature are saved separately in PNG format, each file receives a suffix equal to the corresponding feature name, e.g. `/home/user/pdp_AGE.png`. If the files already exists, they will be overridden. Files are only saves if plot = TRUE (default).
- row_index: Row for which partial dependence will be calculated instead of the whole input frame.
- targets: Target classes for multinomial model.

Value

Plot and list of calculated mean response tables for each feature requested.

Examples

```r
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
prostate[, "CAPSULE"] <- as.factor(prostate[, "CAPSULE"] )
prostate[, "RACE"] <- as.factor(prostate[, "RACE"] )
```
prostate_gbm <- h2o.gbm(x = c("AGE", "RACE"),
                     y = "CAPSULE",
                     training_frame = prostate,
                     ntrees = 10,
                     max_depth = 5,
                     learn_rate = 0.1)

h2o.partialPlot(object = prostate_gbm, data = prostate, cols = c("AGE", "RACE"))

iris_hex <- as.h2o(iris)
iris_gbm <- h2o.gbm(x = c(1:4), y = 5, training_frame = iris_hex)

# one target class
h2o.partialPlot(object = iris_gbm, data = iris_hex, cols="Petal.Length", targets=c("setosa"))
# three target classes
h2o.partialPlot(object = iris_gbm, data = iris_hex, cols="Petal.Length",
                 targets=c("setosa", "virginica", "versicolor"))

## End(Not run)

---

**h2o.pd_multi_plot**  
Plot partial dependencies for a variable across multiple models

**Description**

Partial dependence plot (PDP) gives a graphical depiction of the marginal effect of a variable on the response. The effect of a variable is measured in change in the mean response. PDP assumes independence between the feature for which is the PDP computed and the rest.

**Usage**

h2o.pd_multi_plot(
  object,
  newdata,
  column,
  best_of_family = TRUE,
  target = NULL,
  row_index = NULL,
  max_levels = 30
)

**Arguments**

- **object** Either a list of H2O models/model_ids or an H2OAutoML object.
- **newdata** An H2OFrame.
- **column** A feature column name to inspect. Character string.
- **best_of_family** If TRUE, plot only the best model of each algorithm family; if FALSE, plot all models. Defaults to TRUE.
target
row_index
max_levels

Value
A ggplot2 object

Examples
```r
## Not run:
library(h2o)
h2o.init()

# Import the wine dataset into H2O:
df <- h2o.importFile(f)

# Set the response
response <- "quality"

# Split the dataset into a train and test set:
splits <- h2o.splitFrame(df, ratios = 0.8, seed = 1)
train <- splits[[1]]
test <- splits[[2]]

# Build and train the model:
aml <- h2o.automl(y = response,
                  training_frame = train,
                  max_models = 10,
                  seed = 1)

# Create the partial dependence plot
pdp <- h2o.pd_multi_plot(aml, test, column = "alcohol")
print(pdp)

## End(Not run)
```

Description
Partial dependence plot (PDP) gives a graphical depiction of the marginal effect of a variable on the response. The effect of a variable is measured in change in the mean response. PDP assumes independence between the feature for which is the PDP computed and the rest.
Usage

```r
def2o.pd_plot(
  object,
  newdata,
  column,
  target = NULL,
  row_index = NULL,
  max_levels = 30
)
```

Arguments

- `object`: An H2O model.
- `newdata`: An H2OFrame. Used to generate predictions used in Partial Dependence calculations.
- `column`: A feature column name to inspect. Character string.
- `target`: If multinomial, plot PDP just for `target` category. Character string.
- `max_levels`: An integer specifying the maximum number of factor levels to show. Defaults to 30.

Value

A `ggplot2` object

Examples

```r
## Not run:
library(h2o)
h2o.init()

# Import the wine dataset into H2O:
df <- h2o.importFile(f)

# Set the response
target <- "quality"

# Split the dataset into a train and test set:
splits <- h2o.splitFrame(df, ratios = 0.8, seed = 1)
train <- splits[[1]]
test <- splits[[2]]

# Build and train the model:
model <- h2o.gbm(y = target,
                 training_frame = train)

# Create the partial dependence plot
```
pdp <- h2o.pd_plot(gbm, test, column = "alcohol")
print(pdp)

## End(Not run)

h2o.performance  

Model Performance Metrics in H2O

Description

Given a trained h2o model, compute its performance on the given dataset. However, if the dataset does not contain the response/target column, no performance will be returned. Instead, a warning message will be printed.

Usage

h2o.performance(
  model, 
  newdata = NULL, 
  train = FALSE, 
  valid = FALSE, 
  xval = FALSE, 
  data = NULL, 
  auc_type = "NONE"
)

Arguments

model  
    An H2OModel object

newdata  
    An H2OFrame. The model will make predictions on this dataset, and subsequently score them. The dataset should match the dataset that was used to train the model, in terms of column names, types, and dimensions. If newdata is passed in, then train, valid, and xval are ignored.

train  
    A logical value indicating whether to return the training metrics (constructed during training).

    Note: when the trained h2o model uses balance_classes, the training metrics constructed during training will be from the balanced training dataset. For more information visit: https://0xdata.atlassian.net/browse/TN-9

valid  
    A logical value indicating whether to return the validation metrics (constructed during training).

xval  
    A logical value indicating whether to return the cross-validation metrics (constructed during training).

data  
    (DEPRECATED) An H2OFrame. This argument is now called ‘newdata’.

auc_type  
    For multinomila model only. Set default multinomial AUC type. Must be one of: "AUTO", "NONE", "MACRO_OVR", "WEIGHTED_OVR", "MACRO_OVO", "WEIGHTED_OVO". Default is "NONE"
Value

Returns an object of the H2OModelMetrics subclass.

Examples

```r
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
prostate$CAPSULE <- as.factor(prostate$CAPSULE)
prostate_gbm <- h2o.gbm(3:9, "CAPSULE", prostate)
h2o.performance(model = prostate_gbm, newdata=prostate)

## If model uses balance_classes
## the results from train = TRUE will not match the results from newdata = prostate
prostate_gbm_balanced <- h2o.gbm(3:9, "CAPSULE", prostate, balance_classes = TRUE)
h2o.performance(model = prostate_gbm_balanced, newdata = prostate)
h2o.performance(model = prostate_gbm_balanced, train = TRUE)

## End(Not run)
```

---

### h2o.pivot

**Pivot a frame**

**Description**

Pivot the frame designated by the three columns: index, column, and value. Index and column should be of type enum, int, or time. For cases of multiple indexes for a column label, the aggregation method is to pick the first occurrence in the data frame.

**Usage**

```r
h2o.pivot(x, index, column, value)
```

**Arguments**

- **x**: an H2OFrame
- **index**: the column where pivoted rows should be aligned on
- **column**: the column to pivot
- **value**: values of the pivoted table

**Value**

An H2OFrame with columns from the columns arg, aligned on the index arg, with values from values arg.
Examples

```r
## Not run:
library(h2o)
h2o.init()

df = h2o.createFrame(rows = 1000, cols = 3, factors = 10, integer_fraction = 1.0/3,
categorical_fraction = 1.0/3, missing_fraction = 0.0, seed = 123)
df$C3 = h2o.abs(df$C3)
h2o.pivot(df, index="C3", column="C2", value="C1")

## End(Not run)
```

h2o.prcomp

Principal component analysis of an H2O data frame

Description

Principal components analysis of an H2O data frame using the power method to calculate the singular value decomposition of the Gram matrix.

Usage

```r
h2o.prcomp(
  training_frame,
  x,
  model_id = NULL,
  validation_frame = NULL,
  ignore_const_cols = TRUE,
  score_each_iteration = FALSE,
  transform = c("NONE", "STANDARDIZE", "NORMALIZE", "DEMEAN", "DESCALE"),
  pca_method = c("GramSVD", "Power", "Randomized", "GLRM"),
  pca_impl = c("MTJ_EVD_DENSEMATRIX", "MTJ_EVD_SYMMATRIX", "MTJ_SVD_DENSEMATRIX", "JAMA"),
  k = 1,
  max_iterations = 1000,
  use_all_factor_levels = FALSE,
  compute_metrics = TRUE,
  impute_missing = FALSE,
  seed = -1,
  max_runtime_secs = 0,
  export_checkpoints_dir = NULL
)
```

Arguments

- **training_frame**  Id of the training data frame.
- **x**              A vector containing the character names of the predictors in the model.
model_id  Destination id for this model; auto-generated if not specified.
validation_frame  
Id of the validation data frame.
ignore_const_cols  Logical. Ignore constant columns. Defaults to TRUE.
score_each_iteration  Logical. Whether to score during each iteration of model training. Defaults to FALSE.
transform  Transformation of training data. Must be one of: "NONE", "STANDARDIZE", "NORMALIZE", "DEMEAN", "DESCALE". Defaults to NONE.
pca_method  Specify the algorithm to use for computing the principal components: GramSVD - uses a distributed computation of the Gram matrix, followed by a local SVD; Power - computes the SVD using the power iteration method (experimental); Randomized - uses randomized subspace iteration method; GLRM - fits a generalized low-rank model with L2 loss function and no regularization and solves for the SVD using local matrix algebra (experimental) Must be one of: "GramSVD", "Power", "Randomized", "GLRM". Defaults to GramSVD.
pca_impl  Specify the implementation to use for computing PCA (via SVD or EVD): MTJ_EVD_DENSEMATRIX - eigenvalue decompositions for dense matrix using MTJ; MTJ_EVD_SYMMATRIX - eigenvalue decompositions for symmetric matrix using MTJ; MTJ_SVD_DENSEMATRIX - singular-value decompositions for dense matrix using MTJ; JAMA - eigenvalue decompositions for dense matrix using JAMA. Must be one of: "MTJ_EVD_DENSEMATRIX", "MTJ_EVD_SYMMATRIX", "MTJ_SVD_DENSEMATRIX", "JAMA". Defaults to MTJ_EVD_DENSEMATRIX.
k  Rank of matrix approximation. Defaults to 1.
max_iterations  Maximum training iterations. Defaults to 1000.
use_all_factor_levels  Logical. Whether first factor level is included in each categorical expansion. Defaults to FALSE.
compute_metrics  Logical. Whether to compute metrics on the training data. Defaults to TRUE.
impute_missing  Logical. Whether to impute missing entries with the column mean. Defaults to FALSE.
seed  Seed for random numbers (affects certain parts of the algo that are stochastic and those might or might not be enabled by default). Defaults to -1 (time-based random number).
max_runtime_secs  Maximum allowed runtime in seconds for model training. Use 0 to disable. Defaults to 0.
export_checkpoints_dir  Automatically export generated models to this directory.

Value

an object of class H2ODimReductionModel.

Examples

```r
## Not run:
library(h2o)
h2o.init()
australia_path <- system.file("extdata", "australia.csv", package = "h2o")
australia <- h2o.uploadFile(path = australia_path)
h2o.prcomp(training_frame = australia, k = 8, transform = "STANDARDIZE")

## End(Not run)
```

---

**h2o.predict**

Predict on an H2O Model

**Description**

Predict on an H2O Model

**Usage**

```
h2o.predict(object, newdata, ...)
```

**Arguments**

- **object**: a fitted model object for which prediction is desired.
- **newdata**: An H2OFrame object in which to look for variables with which to predict.
- **...**: additional arguments to pass on.

**Value**

Returns an H2OFrame object with probabilities and default predictions.
h2o.predict_json  

**H2O Prediction from R without having H2O running**

**Description**

Provides the method h2o.predict with which you can predict a MOJO or POJO Jar model from R.

**Usage**

```
h2o.predict_json(model, json, genmodelpath, labels, classpath, javaoptions)
```

**Arguments**

- **model**: String with file name of MOJO or POJO Jar
- **json**: JSON String with inputs to model
- **genmodelpath**: (Optional) path name to h2o-genmodel.jar, if not set defaults to same dir as MOJO
- **labels**: (Optional) if TRUE then show output labels in result
- **classpath**: (Optional) Extra items for the class path of where to look for Java classes, e.g., h2o-genmodel.jar
- **javaoptions**: (Optional) Java options string, default if "-Xmx4g"

**Value**

Returns an object with the prediction result

**Examples**

```r
## Not run:
library(h2o)
h2o.predict_json("~/GBM_model_python_1473313897851_6.zip", '{"C7":1}')
h2o.predict_json("~/GBM_model_python_1473313897851_6.zip", '{"C7":1}', c(".", "lib"))
## End(Not run)
```

---

h2o.print  

**Print An H2OFrame**

**Description**

Print An H2OFrame

**Usage**

```
h2o.print(x, n = 6L)
```
Arguments

x  An H2OFrame object

n  An (Optional) A single integer. If positive, number of rows in x to return. If negative, all but the n first/last number of rows in x. Anything bigger than 20 rows will require asking the server (first 20 rows are cached on the client).

Examples

```r
## Not run:
library()
h2o.init()

iris <- h2o.importFile(f)
h2o.print(iris["species"], n = 15)

## End(Not run)
```

---

**h2o.prod**

*Return the product of all the values present in its arguments.*

Description

Return the product of all the values present in its arguments.

Usage

```r
h2o.prod(x)
```

Arguments

x  An H2OFrame object.

See Also

`prod` for the base R implementation.

Examples

```r
## Not run:
library(h2o)
h2o.init()

iris <- h2o.importFile(f)
h2o.prod(iris["petal_len"])

## End(Not run)
```
h2o.proj_archetypes

Convert Archetypes to Features from H2O GLRM Model

Description

Project each archetype in an H2O GLRM model into the corresponding feature space from the H2O training frame.

Usage

h2o.proj_archetypes(object, data, reverse_transform = FALSE)

Arguments

object An H2ODimReductionModel object that represents the model containing archetypes to be projected.
data An H2OFrame object representing the training data for the H2O GLRM model.
reverse_transform (Optional) A logical value indicating whether to reverse the transformation from model-building by re-scaling columns and adding back the offset to each column of the projected archetypes.

Value

Returns an H2OFrame object containing the projection of the archetypes down into the original feature space, where each row is one archetype.

See Also

h2o.glrm for making an H2ODimReductionModel.

Examples

```r
## Not run:
library(h2o)
h2o.init()
iris_hf <- as.h2o(iris)
iris_glrm <- h2o.glrm(training_frame = iris_hf, k = 4, loss = "Quadratic",
                      multi_loss = "Categorical", max_iterations = 1000)
iris_parch <- h2o.proj_archetypes(iris_glrm, iris_hf)
head(iris_parch)
## End(Not run)
```
**Description**

Alpha version. Supports only binomial classification problems.

**Usage**

```r
h2o.psvm(
  x,
  y,
  training_frame,
  model_id = NULL,
  validation_frame = NULL,
  ignore_const_cols = TRUE,
  hyper_param = 1,
  kernel_type = c("gaussian"),
  gamma = -1,
  rank_ratio = -1,
  positive_weight = 1,
  negative_weight = 1,
  disable_training_metrics = TRUE,
  sv_threshold = 1e-04,
  fact_threshold = 1e-05,
  feasible_threshold = 0.001,
  surrogate_gap_threshold = 0.001,
  mu_factor = 10,
  max_iterations = 200,
  seed = -1
)
```

**Arguments**

- **x** *(Optional)* A vector containing the names or indices of the predictor variables to use in building the model. If `x` is missing, then all columns except `y` are used.

- **y** The name or column index of the response variable in the data. The response must be either a binary categorical/factor variable or a numeric variable with values -1/1 (for compatibility with SVMlight format).

- **training_frame** Id of the training data frame.

- **model_id** Destination id for this model; auto-generated if not specified.

- **validation_frame** Id of the validation data frame.

- **ignore_const_cols** Logical. Ignore constant columns. Defaults to `TRUE`.

- **hyper_param** Penalty parameter C of the error term. Defaults to 1.
kernel_type  Type of used kernel Must be one of: "gaussian". Defaults to gaussian.
gamma  Coefficient of the kernel (currently RBF gamma for gaussian kernel. -1 means 1/#features) Defaults to -1.
rank_ratio  Desired rank of the ICF matrix expressed as an ration of number of input rows (-1 means use sqrt(#rows)). Defaults to -1.
positive_weight  Weight of positive (+1) class of observations Defaults to 1.
negative_weight  Weight of positive (-1) class of observations Defaults to 1.
disable_training_metrics  Logical. Disable calculating training metrics (expensive on large datasets) Defaults to TRUE.
sv_threshold  Threshold for accepting a candidate observation into the set of support vectors Defaults to 0.0001.
fact_threshold  Convergence threshold of the Incomplete Cholesky Factorization (ICF) Defaults to le-05.
feasible_threshold  Convergence threshold for primal-dual residuals in the IPM iteration Defaults to 0.001.
surrogate_gap_threshold  Feasibility criterion of the surrogate duality gap (eta) Defaults to 0.001.
mu_factor  Increasing factor mu Defaults to 10.
max_iterations  Maximum number of iteration of the algorithm Defaults to 200.
seed  Seed for random numbers (affects certain parts of the algo that are stochastic and those might or might not be enabled by default). Defaults to -1 (time-based random number).

Examples
## Not run:
library(h2o)
h2o.init()

# Import the splice dataset
f <- "https://s3.amazonaws.com/h2o-public-test-data/smalldata/splice/splice.svm"
splice <- h2o.importFile(f)

# Train the Support Vector Machine model
svm_model <- h2o.psvm(gamma = 0.01, rank_ratio = 0.1,
y = "C1", training_frame = splice,
   disable_training_metrics = FALSE)

## End(Not run)
**h2o.quantile**

Quantiles of H2O Frames.

**Description**

Obtain and display quantiles for H2O parsed data.

**Usage**

```r
h2o.quantile(
  x,
  probs = c(0.001, 0.01, 0.1, 0.25, 0.333, 0.5, 0.667, 0.75, 0.9, 0.99, 0.999),
  combine_method = c("interpolate", "average", "avg", "low", "high"),
  weights_column = NULL,
  ...
)
```

## S3 method for class 'H2OFrame'

```r
quantile(  
  x,
  probs = c(0.001, 0.01, 0.1, 0.25, 0.333, 0.5, 0.667, 0.75, 0.9, 0.99, 0.999),
  combine_method = c("interpolate", "average", "avg", "low", "high"),
  weights_column = NULL,
  ...
)
```

**Arguments**

- `x` An H2OFrame object with a single numeric column.
- `probs` Numeric vector of probabilities with values in [0,1].
- `combine_method` How to combine quantiles for even sample sizes. Default is to do linear interpolation. E.g., If method is "lo", then it will take the lo value of the quantile. Abbreviations for average, low, and high are acceptable (avg, lo, hi).
- `weights_column` (Optional) String name of the observation weights column in x or an H2OFrame object with a single numeric column of observation weights.
- `...` Further arguments passed to or from other methods.

**Details**

**Value**

A vector describing the percentiles at the given cutoffs for the H2OFrame object.
Examples

```r
## Not run:
# Request quantiles for an H2O parsed data set:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
# Request quantiles for a subset of columns in an H2O parsed data set
quantile(prostate[, 3])
for(i in 1:ncol(prostate))
  quantile(prostate[, i])

## End(Not run)
```

### h2o.r2

Retrieves the R2 value

#### Description

Retrieves the R2 value from an H2O model. Will return $R^2$ for GLM Models and will return NaN otherwise. If "train", "valid", and "xval" parameters are FALSE (default), then the training R2 value is returned. If more than one parameter is set to TRUE, then a named vector of R2s are returned, where the names are "train", "valid" or "xval".

#### Usage

```r
h2o.r2(object, train = FALSE, valid = FALSE, xval = FALSE)
```

#### Arguments

- **object**: An H2OModel object.
- **train**: Retrieve the training R2
- **valid**: Retrieve the validation set R2 if a validation set was passed in during model build time.
- **xval**: Retrieve the cross-validation R2

#### Examples

```r
## Not run:
library(h2o)

h <- h2o.init()
fr <- as.h2o(iris)
m <- h2o.glm(x = 2:5, y = 1, training_frame = fr)
h2o.r2(m)

## End(Not run)
```
Description

Builds a Random Forest model on an H2OFrame.

Usage

h2o.randomForest(
  x,
  y,
  training_frame,
  model_id = NULL,

min_split_improvement = 1e-05,
histogram_type = c("AUTO", "UniformAdaptive", "Random", "QuantilesGlobal",
"RoundRobin"),
categorical_encoding = c("AUTO", "Enum", "OneHotInternal", "OneHotExplicit",
"Binary", "Eigen", "LabelEncoder", "SortByResponse", "EnumLimited"),
calibrate_model = FALSE,
calibration_frame = NULL,
distribution = c("AUTO", "bernoulli", "multinomial", "gaussian", "poisson", "gamma",
"tweedie", "laplace", "quantile", "huber"),
custom_metric_func = NULL,
export_checkpoints_dir = NULL,
check_constant_response = TRUE,
gainslift_bins = -1,
auc_type = c("AUTO", "NONE", "MACRO_OVR", "WEIGHTED_OVR", "MACRO_OVO",
"WEIGHTED_OVO"),
verbose = FALSE
\)

Arguments

x (Optional) A vector containing the names or indices of the predictor variables to
use in building the model. If x is missing, then all columns except y are used.

y The name or column index of the response variable in the data. The response
must be either a numeric or a categorical/factor variable. If the response is
numeric, then a regression model will be trained, otherwise it will train a classi-
fication model.

training_frame Id of the training data frame.
model_id Destination id for this model; auto-generated if not specified.
validation_frame Id of the validation data frame.
nfolds Number of folds for K-fold cross-validation (0 to disable or >= 2). Defaults to
0.
keep_cross_validation_models Logical. Whether to keep the cross-validation models. Defaults to TRUE.
keep_cross_validation_predictions Logical. Whether to keep the predictions of the cross-validation models. De-
faults to FALSE.
keep_cross_validation_fold_assignment Logical. Whether to keep the cross-validation fold assignment. Defaults to
FALSE.
score_each_iteration Logical. Whether to score during each iteration of model training. Defaults to
FALSE.
score_tree_interval
Score the model after every so many trees. Disabled if set to 0. Defaults to 0.

fold_assignment
Cross-validation fold assignment scheme, if fold_column is not specified. The 'Stratified' option will stratify the folds based on the response variable, for classification problems. Must be one of: "AUTO", "Random", "Modulo", "Stratified". Defaults to AUTO.

fold_column
Column with cross-validation fold index assignment per observation.

ignore_const_cols
Logical. Ignore constant columns. Defaults to TRUE.

offset_column
Offset column. This argument is deprecated and has no use for Random Forest.

weights_column
Column with observation weights. Giving some observation a weight of zero is equivalent to excluding it from the dataset; giving an observation a relative weight of 2 is equivalent to repeating that row twice. Negative weights are not allowed. Note: Weights are per-row observation weights and do not increase the size of the data frame. This is typically the number of times a row is repeated, but non-integer values are supported as well. During training, rows with higher weights matter more, due to the larger loss function pre-factor.

balance_classes
Logical. Balance training data class counts via over/under-sampling (for imbalanced data). Defaults to FALSE.

class_sampling_factors
Desired over/under-sampling ratios per class (in lexicographic order). If not specified, sampling factors will be automatically computed to obtain class balance during training. Requires balance_classes.

max_after_balance_size
Maximum relative size of the training data after balancing class counts (can be less than 1.0). Requires balance_classes. Defaults to 5.0.

ntrees
Number of trees. Defaults to 50.

max_depth
Maximum tree depth (0 for unlimited). Defaults to 20.

min_rows
Fewest allowed (weighted) observations in a leaf. Defaults to 1.

nbins
For numerical columns (real/int), build a histogram of (at least) this many bins, then split at the best point. Defaults to 20.

nbins_top_level
For numerical columns (real/int), build a histogram of (at most) this many bins at the root level, then decrease by factor of two per level. Defaults to 1024.

nbins_cats
For categorical columns (factors), build a histogram of this many bins, then split at the best point. Higher values can lead to more overfitting. Defaults to 1024.

r2_stopping
r2_stopping is no longer supported and will be ignored if set - please use stopping_rounds, stopping_metric and stopping_tolerance instead. Previous version of H2O would stop making trees when the R^2 metric equals or exceeds this. Defaults to 1.797693135e+308.

stopping_rounds
Early stopping based on convergence of stopping_metric. Stop if simple moving average of length k of the stopping_metric does not improve for k:=stopping_rounds scoring events (0 to disable). Defaults to 0.
stopping_metric
Metric to use for early stopping (AUTO: logloss for classification, deviance for regression and anomaly_score for Isolation Forest). Note that custom and custom_increasing can only be used in GBM and DRF with the Python client. Must be one of: "AUTO", "deviance", "logloss", "MSE", "RMSE", "MAE", "RMSLE", "AUC", "AUCPR", "lift_top_group", "misclassification", "mean_per_class_error", "custom", "custom_increasing". Defaults to AUTO.

stopping_tolerance
Relative tolerance for metric-based stopping criterion (stop if relative improvement is not at least this much) Defaults to 0.001.

max_runtime_secs
Maximum allowed runtime in seconds for model training. Use 0 to disable. Defaults to 0.

seed
Seed for random numbers (affects certain parts of the algo that are stochastic and those might or might not be enabled by default). Defaults to -1 (time-based random number).

build_tree_one_node
Logical. Run on one node only; no network overhead but fewer cpus used. Suitable for small datasets. Defaults to FALSE.

mtries
Number of variables randomly sampled as candidates at each split. If set to -1, defaults to \( \sqrt{p} \) for classification and \( p/3 \) for regression (where \( p \) is the # of predictors). Defaults to -1.

sample_rate
Row sample rate per tree (from 0.0 to 1.0) Defaults to 0.632.

sample_rate_per_class
A list of row sample rates per class (relative fraction for each class, from 0.0 to 1.0), for each tree

binomial_double_trees
Logical. For binary classification: Build 2x as many trees (one per class) - can lead to higher accuracy. Defaults to FALSE.

checkpoint
Model checkpoint to resume training with.

col_sample_rate_change_per_level
Relative change of the column sampling rate for every level (must be > 0.0 and <= 2.0) Defaults to 1.

col_sample_rate_per_tree
Column sample rate per tree (from 0.0 to 1.0) Defaults to 1.

min_split_improvement
Minimum relative improvement in squared error reduction for a split to happen. Defaults to 1e-05.

histogram_type
What type of histogram to use for finding optimal split points. Must be one of: "AUTO", "UniformAdaptive", "Random", "QuantilesGlobal", "RoundRobin". Defaults to AUTO.

categorical_encoding
Encoding scheme for categorical features. Must be one of: "AUTO", "Enum", "OneHotInternal", "OneHotExplicit", "Binary", "Eigen", "LabelEncoder", "Sort-ByResponse", "EnumLimited". Defaults to AUTO.
calibrate_model
Logical. Use Platt Scaling to calculate calibrated class probabilities. Calibration can provide more accurate estimates of class probabilities. Defaults to FALSE.

calibration_frame
Calibration frame for Platt Scaling

distribution
Distribution. This argument is deprecated and has no use for Random Forest.

custom_metric_func
Reference to custom evaluation function, format: ‘language:keyName=funcName’

export_checkpoints_dir
Automatically export generated models to this directory.

check_constant_response
Logical. Check if response column is constant. If enabled, then an exception is thrown if the response column is a constant value. If disabled, then model will train regardless of the response column being a constant value or not. Defaults to TRUE.

gainslift_bins
Gains/Lift table number of bins. 0 means disabled. Default value -1 means automatic binning. Defaults to -1.

roc_auc
Set default multinomial AUC type. Must be one of: "AUTO", "NONE", "MACRO_OVR", "WEIGHTED_OVR", "MACRO_OVO", "WEIGHTED_OVO". Defaults to AUTO.

verbose
Logical. Print scoring history to the console (Metrics per tree). Defaults to FALSE.

Value
Creates a H2OModel object of the right type.

See Also
predict.H2OModel for prediction

Examples

```r
## Not run:
library(h2o)
h2o.init()

# Import the cars dataset
cars <- h2o.importFile(f)

# Set predictors and response; set response as a factor
cars["economy_20mpg"] <- as.factor(cars["economy_20mpg"])
predictors <- c("displacement", "power", "weight", "acceleration", "year")
response <- "economy_20mpg"

# Train the DRF model
cars_drf <- h2o.randomForest(x = predictors, y = response, 
                           training_frame = cars, nfolds = 5,
```

h2o.randomForest

273
## h2o.range

Returns a vector containing the minimum and maximum of all the given arguments.

### Description

Returns a vector containing the minimum and maximum of all the given arguments.

### Usage

```r
h2o.range(x, na.rm = FALSE, finite = FALSE)
```

### Arguments

- **x**: An H2OFrame object.
- **na.rm**: logical. indicating whether missing values should be removed.
- **finite**: logical. indicating if all non-finite elements should be omitted.

### See Also

- `range` for the base R implementation.

### Examples

```r
## Not run:
library(h2o)
h2o.init()

iris <- h2o.importFile(f)
h2o.range(iris["petal_len"], na.rm = TRUE, finite = TRUE)

## End(Not run)
```
This function will add a new column rank where the ranking is produced as follows: 1. sorts the H2OFrame by columns sorted in by columns specified in group_by_cols and sort_cols in the directions specified by the ascending for the sort_cols. The sort directions for the group_by_cols are ascending only. 2. A new rank column is added to the frame which will contain a rank assignment performed next. The user can choose to assign a name to this new column. The default name is New_Rank_column. 3. For each groupby groups, a rank is assigned to the row starting from 1, 2, ... to the end of that group. 4. If sort_cols_sorted is TRUE, a final sort on the frame will be performed frame according to the sort_cols and the sort directions in ascending. If sort_cols_sorted is FALSE (by default), the frame from step 3 will be returned as is with no extra sort. This may provide a small speedup if desired.

**Usage**

```r
h2o.rank_within_group_by(
  x,
  group_by_cols,
  sort_cols,
  ascending = NULL,
  new_col_name = "New_Rank_column",
  sort_cols_sorted = FALSE
)
```

**Arguments**

- **x**
  - The H2OFrame input to be sorted.

- **group_by_cols**
  - a list of column names or indices to form the groupby groups

- **sort_cols**
  - a list of column names or indices for sorting
ascending a list of Boolean to determine if ascending sort (set to TRUE) is needed for each column in sort_cols (optional). Default is ascending sort for all. To perform descending sort, set value to FALSE.

new_col_name new column name for the newly added rank column if specified (optional). Default name is New_Rank_column.

sort_cols_sorted Boolean to determine if the final returned frame is to be sorted according to the sort_cols and sort directions in ascending. Default is FALSE.

The following example is generated by Nidhi Mehta.

If the input frame is train:

```
  ID Group_by_column num data Column_to_arrange_by num_1 fdata 12 1 2941.552
  1 3 -3177.9077 1 1 12 1 2941.552 1 5 -13311.8247 1 12 2 -22722.174 1 3
  -3177.9077 1 1 12 -22722.174 1 5 -13311.8247 1 13 3 -12776.884 1 5 -18421.6171
  0 13 3 -12776.884 1 4 28080.1607 0 13 -6049.830 1 5 -18421.6171 0 13 1
  -6049.830 1 4 28080.1607 0 15 3 -16995.346 1 1 -9781.6373 0 16 1 -10003.593
  0 3 -61284.6900 0 16 3 26052.495 1 3 -61284.6900 0 16 3 -22905.288 0 3
  -61284.6900 0 17 2 -13465.496 1 2 12094.4851 1 17 2 -13465.496 1 3 -11772.1338
  1 17 2 -13465.496 1 3 -415.1114 0 17 2 -3329.619 1 2 12094.4851 1 17 2
  -3329.619 1 3 -11772.1338 1 17 2 -3329.619 1 3 -415.1114 0 3
  -61284.6900 0 2 16 3 -22905.288 1 3 -61284.6900 0 3 13 3 -12776.884 1 4
  28080.1607 0 4 13 3 -12776.884 1 5 -18421.6171 0 5
  If the following commands are issued: rankedF1 <- h2o.rank_within_group_by(train,
  c("Group_by_column"), c("Column_to_arrange_by"), c(TRUE))
  h2o.summary(rankedF1)
  The returned frame rankedF1 will look like this: ID Group_by_column num data
  Column_to_arrange_by num_1 fdata.1 New_Rank_column
  1 3 -3177.9077 1 1 16 1 -10003.593 0 3 -61284.6900 0 2 13 1 -6049.830 0
  4 28080.1607 0 3 12 1 2941.552 1 5 -13311.8247 1 4 13 1 -6049.830 0 5
  -18421.6171 0 5 17 2 -13465.496 0 2 12094.4851 1 1 17 2 -3329.619 0 2
  12094.4851 1 2 12 2 -22722.174 1 3 -3177.9077 1 3 17 2 -13465.496 0 3
  -11772.1338 1 4 17 2 -13465.496 0 3 -415.1114 0 7 12 2 -22722.174 1 5

```
Examples

## Not run:
library(h2o)
h2o.init()

f <- "https://s3.amazonaws.com/h2o-public-test-data/smalldata/airlines/allyears2k_headers.zip"
air <- h2o.importFile(f)
group_cols <- c("Distance")
sort_cols <- c("IsArrDelayed", "IsDepDelayed")
sort_directions <- c(TRUE, FALSE)
h2o.rank_within_group_by(x = air, group_by_cols = group_cols,
 sort_cols = sort_cols,
 ascending = sort_directions,
 new_col_name = "New_Rank",
 sort_cols_sorted = TRUE)

## End(Not run)

h2o.rapids

Execute a Rapids expression.

Description

Execute a Rapids expression.

Usage

h2o.rapids(expr)

Arguments

expr The rapids expression (ascii string)

Examples

## Not run:
h2o.rapids('setproperty "sys.ai.h2o.algos.evaluate_auto_model_parameters" "true"')

## End(Not run)
**h2o.rbind**  
*Combine H2O Datasets by Rows*

**Description**
Takes a sequence of H2O data sets and combines them by rows.

**Usage**
```r
h2o.rbind(...) 
```

**Arguments**
- `...`  
  A sequence of H2OFrame arguments. All datasets must exist on the same H2O instance (IP and port) and contain the same number and types of columns.

**Value**
An H2OFrame object containing the combined...arguments row-wise.

**See Also**
- `cbind` for the base R method, `rbind()`.

**Examples**
```r
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
prostate_rbind <- h2o.rbind(prostate, prostate)
head(prostate_rbind)
dim(prostate)
dim(prostate_rbind)
## End(Not run)
```

---

**h2o.reconstruct**  
*Reconstruct Training Data via H2O GLRM Model*

**Description**
Reconstruct the training data and impute missing values from the H2O GLRM model by computing the matrix product of X and Y, and transforming back to the original feature space by minimizing each column's loss function.
Usage

h2o.reconstruct(object, data, reverse_transform = FALSE)

Arguments

object    An H2ODimReductionModel object that represents the model to be used for reconstruction.
data     An H2OFrame object representing the training data for the H2O GLRM model. Used to set the domain of each column in the reconstructed frame.
reverse_transform  (Optional) A logical value indicating whether to reverse the transformation from model-building by re-scaling columns and adding back the offset to each column of the reconstructed frame.

Value

Returns an H2OFrame object containing the approximate reconstruction of the training data;

See Also

h2o.glrm for making an H2ODimReductionModel.

Examples

```r
## Not run:
library(h2o)
h2o.init()
iris_hf <- as.h2o(iris)
iris_glrm <- h2o.glrm(training_frame = iris_hf, k = 4, transform = "STANDARDIZE",
                     loss = "Quadratic", multi_loss = "Categorical", max_iterations = 1000)
iris_rec <- h2o.reconstruct(iris_glrm, iris_hf, reverse_transform = TRUE)
head(iris_rec)
## End(Not run)
```

---

**h2o.relevel**

Reorders levels of an H2O factor, similarly to standard R's `relevel`.

Description

The levels of a factor are reordered so that the reference level is at level 0, remaining levels are moved down as needed.

Usage

h2o.relevel(x, y)
Arguments

  x  factor column in h2o frame
  y  reference level (string)

Value

  new reordered factor column

Examples

## Not run:
library(h2o)
h2o.init()

  # Convert iris dataset to an H2OFrame
  iris_hf <- as.h2o(iris)
  # Look at current ordering of the Species column levels
  h2o.levels(iris_hf["Species"])
  # "setosa"  "versicolor" "virginica"
  # Change the reference level to "virginica"
  iris_hf["Species"] <- h2o.relevel(x = iris_hf["Species"], y = "virginica")
  # Observe new ordering
  h2o.levels(iris_hf["Species"])
  # "virginica"  "setosa"  "versicolor"

## End(Not run)
See Also

h2o.rm

Examples

## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
h2o.ls()
h2o.removeAll()
h2o.ls()

## End(Not run)

h2o.removeVecs  Delete Columns from an H2OFrame

Description

Delete the specified columns from the H2OFrame. Returns an H2OFrame without the specified columns.

Usage

h2o.removeVecs(data, cols)

Arguments

data  The H2OFrame.
cols  The columns to remove.

h2o.rep_len  Replicate Elements of Vectors or Lists into H2O

Description

h2o.rep_len performs just as rep does. It replicates the values in x in the H2O backend.

Usage

h2o.rep_len(x, length.out)
Arguments

   x    an H2O frame
 length.out   non negative integer. The desired length of the output vector.

Value

Creates an H2OFrame of the same type as x

Examples

## Not run:
library(h2o)
h2o.init()

iris <- h2o.importFile(f)
h2o.rep_len(iris, length.out = 3)

## End(Not run)

---

h2o.reset_threshold    Reset model threshold and return old threshold value.

Description

Reset model threshold and return old threshold value.

Usage

h2o.reset_threshold(object, threshold)

Arguments

   object    An H2OModel object.
 threshold   A threshold value from 0 to 1 included.

Value

Returns the previous threshold used in the model.

Examples

## Not run:
library(h2o)
h2o.init()

prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.importFile(prostate_path)
prostate[, 2] <- as.factor(prostate[, 2])
prostate_glm <- h2o.glm(y = "CAPSULE", x = c("AGE", "RACE", "PSA", "DCAPS"),
  training_frame = prostate, family = "binomial",
  nfolds = 0, alpha = 0.5, lambda_search = FALSE)
old_threshold <- h2o.reset_threshold(prostate_glm, 0.9)
## End(Not run)

h2o.residual_analysis_plot

Residual Analysis

Description
Do Residual Analysis and plot the fitted values vs residuals on a test dataset. Ideally, residuals should be randomly distributed. Patterns in this plot can indicate potential problems with the model selection, e.g., using simpler model than necessary, not accounting for heteroscedasticity, autocorrelation, etc. If you notice "striped" lines of residuals, that is just an indication that your response variable was integer valued instead of real valued.

Usage
h2o.residual_analysis_plot(model, newdata)

Arguments

model       An H2OModel.
newdata     An H2OFrame. Used to calculate residuals.

Value
A ggplot2 object

Examples

## Not run:
library(h2o)
h2o.init()

# Import the wine dataset into H2O:
df <- h2o.importFile(f)

# Set the response
response <- "quality"

# Split the dataset into a train and test set:
splits <- h2o.splitFrame(df, ratios = 0.8, seed = 1)
train <- splits[[1]]
test <- splits[[2]]

# Build and train the model:
gbm <- h2o.gbm(y = response,
    training_frame = train)

# Create the residual analysis plot
residual_analysis_plot <- h2o.residual_analysis_plot(gbm, test)
print(residual_analysis_plot)

## End(Not run)

---

**h2o.residual_deviance**  
*Retrieve the residual deviance*

**Description**

If "train", "valid", and "xval" parameters are FALSE (default), then the training residual deviance value is returned. If more than one parameter is set to TRUE, then a named vector of residual deviances are returned, where the names are "train", "valid" or "xval".

**Usage**

```r
h2o.residual_deviance(object, train = FALSE, valid = FALSE, xval = FALSE)
```

**Arguments**

- **object**  
  An H2OModel or H2OModelMetrics
- **train**  
  Retrieve the training residual deviance
- **valid**  
  Retrieve the validation residual deviance
- **xval**  
  Retrieve the cross-validation residual deviance

**Examples**

```r
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.importFile(prostate_path)
prostate[, 2] <- as.factor(prostate[, 2])
prostate_glm <- h2o.glm(y = "CAPSULE", x = c("AGE", "RACE", "PSA", "DCAPS"),
    training_frame = prostate, family = "binomial",
    nfolds = 0, alpha = 0.5, lambda_search = FALSE)
h2o.residual_deviance(prostate_glm, train = TRUE)

## End(Not run)
```
h2o.residual_dof

Retrieve the residual degrees of freedom

Description

If "train", "valid", and "xval" parameters are FALSE (default), then the training residual degrees of freedom value is returned. If more than one parameter is set to TRUE, then a named vector of residual degrees of freedom are returned, where the names are "train", "valid" or "xval".

Usage

h2o.residual_dof(object, train = FALSE, valid = FALSE, xval = FALSE)

Arguments

object An H2OModel or H2OModelMetrics
train Retrieve the training residual degrees of freedom
valid Retrieve the validation residual degrees of freedom
xval Retrieve the cross-validation residual degrees of freedom

Examples

```r
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.importFile(prostate_path)
prostate[, 2] <- as.factor(prostate[, 2])
prostate_glm <- h2o.glm(y = "CAPSULE", x = c("AGE", "RACE", "PSA", "DCAPS"),
                       training_frame = prostate, family = "binomial",
                       nfolds = 0, alpha = 0.5, lambda_search = FALSE)
h2o.residual_dof(prostate_glm, train = TRUE)
## End(Not run)
```

h2o.resume

Triggers auto-recovery resume - this will look into configured recovery dir and resume and tasks that were interrupted by unexpected cluster stopping.

Description

Triggers auto-recovery resume - this will look into configured recovery dir and resume and tasks that were interrupted by unexpected cluster stopping.
**Usage**

```r
h2o.resume(recovery_dir = NULL)
```

**Arguments**

- `recovery_dir` A character path to where cluster recovery data is stored, if blank, will use cluster's configuration.

---

**h2o.resumeGrid**

*Resume previously stopped grid training.*

**Description**

Resume previously stopped grid training.

**Usage**

```r
h2o.resumeGrid(grid_id, recovery_dir = NULL, ...)
```

**Arguments**

- `grid_id` ID of existing grid search
- `recovery_dir` When specified the grid and all necessary data (frames, models) will be saved to this directory (use HDFS or other distributed file-system). Should the cluster crash during training, the grid can be reloaded from this directory via `h2o.loadGrid` and training can be resumed
- `...` Additional parameters to modify the resumed Grid.

---

**h2o.rm**

*Delete Objects In H2O*

**Description**

Remove the h2o Big Data object(s) having the key name(s) from ids.

**Usage**

```r
h2o.rm(ids, cascade = TRUE)
```

**Arguments**

- `ids` The object or hex key associated with the object to be removed or a vector/list of those things.
- `cascade` Boolean, if set to TRUE (default), the object dependencies (e.g. submodels) are also removed.
h2o.rmse

See Also

h2o.assign, h2o.ls

Examples

## Not run:
library(h2o)
h2o.init()
iris <- as.h2o(iris)
model <- h2o.glm(1:4,5,training = iris, family = "multinomial")
h2o.rm(iris)
## End(Not run)

h2o.rmse

Retrieves Root Mean Squared Error Value

Description

Retrieves the root mean squared error value from an H2OModelMetrics object. If "train", "valid", and "xval" parameters are FALSE (default), then the training RMSE value is returned. If more than one parameter is set to TRUE, then a named vector of RMSEs are returned, where the names are "train", "valid" or "xval".

Usage

h2o.rmse(object, train = FALSE, valid = FALSE, xval = FALSE)

Arguments

object An H2OModelMetrics object of the correct type.
train Retrieve the training RMSE
valid Retrieve the validation RMSE
xval Retrieve the cross-validation RMSE

Details

This function only supports H2OBinomialMetrics, H2OMultinomialMetrics, and H2ORegressionMetrics objects.

See Also

h2o.auc for AUC, h2o.mse for RMSE, and h2o.metric for the various threshold metrics. See h2o.performance for creating H2OModelMetrics objects.
Examples

```r
## Not run:
library(h2o)
h2o.init()

prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(prostate_path)

prostate[, 2] <- as.factor(prostate[, 2])
model <- h2o.gbm(x = 3:9, y = 2, training_frame = prostate, distribution = "bernoulli")
perf <- h2o.performance(model, prostate)
h2o.rmse(perf)

## End(Not run)
```

---

**h2o.rmsle**

Retrieves the Root Mean Squared Log Error

### Description

Retrieves the root mean squared log error (RMSLE) value from an H2O model. If "train", "valid", and "xval" parameters are FALSE (default), then the training rmsle value is returned. If more than one parameter is set to TRUE, then a named vector of rmsles are returned, where the names are "train", "valid" or "xval".

### Usage

```r
h2o.rmsle(object, train = FALSE, valid = FALSE, xval = FALSE)
```

### Arguments

- **object**: An H2OModel object.
- **train**: Retrieve the training rmsle
- **valid**: Retrieve the validation set rmsle if a validation set was passed in during model build time.
- **xval**: Retrieve the cross-validation rmsle

### Examples

```r
## Not run:
library(h2o)

h <- h2o.init()
fr <- as.h2o(iris)
m <- h2o.deeplearning(x = 2:5, y = 1, training_frame = fr)

h2o.rmsle(m)
```
## h2o.round

### Description

Round doubles/floats to the given number of decimal places.

### Usage

```r
eh2o.round(x, digits = 0)
round(x, digits = 0)
```

### Arguments

- `x`: An H2OFrame object.
- `digits`: Number of decimal places to round doubles/floats. Rounding to a negative number of decimal places is...

### See Also

- `Round` for the base R implementation, `round()`.

### Examples

```r
## Not run:
library(h2o)
h2o.init()

f <- "https://s3.amazonaws.com/h2o-public-test-data/smalldata/coxph_test/heart.csv"
heart <- h2o.importFile(f)

h2o.round(heart["age"], digits = 3)

## End(Not run)
```
h2o.rstrip  

`Strip set from right`

**Description**

Return a copy of the target column with trailing characters removed. The set argument is a string specifying the set of characters to be removed. If omitted, the set argument defaults to removing whitespace.

**Usage**

```r
h2o.rstrip(x, set = " ")
```

**Arguments**

- `x` The column whose strings should be rstrip-ed.
- `set` string of characters to be removed

**Examples**

```r
## Not run:
library(h2o)
h2o.init()
string_to_rstrip <- as.h2o("1234567890")
rstrip_string <- h2o.rstrip(string_to_rstrip, "890") #Remove "890"
## End(Not run)
```

h2o.rulefit  

`Build a RuleFit Model`

**Description**

Builds a Distributed RuleFit model on a parsed dataset, for regression or classification.

**Usage**

```r
h2o.rulefit(
  x,
  y,
  training_frame,
  model_id = NULL,
  validation_frame = NULL,
  seed = -1,
  algorithm = c("AUTO", "DRF", "GBM"),
  min_rule_length = 3,
)```
max_rule_length = 3,
max_num_rules = -1,
model_type = c("rules_and_linear", "rules", "linear"),
weights_column = NULL,
distribution = c("AUTO", "bernoulli", "multinomial", "gaussian", "poisson", "gamma",
  "tweedie", "laplace", "quantile", "huber"),
rule_generation_ntrees = 50
)

Arguments

x (Optional) A vector containing the names or indices of the predictor variables to use in building the model. If x is missing, then all columns except y are used.

y The name or column index of the response variable in the data. The response must be either a numeric or a categorical/factor variable. If the response is numeric, then a regression model will be trained, otherwise it will train a classification model.

training_frame Id of the training data frame.
model_id Destination id for this model; auto-generated if not specified.
validation_frame Id of the validation data frame.
seed Seed for random numbers (affects certain parts of the algo that are stochastic and those might or might not be enabled by default). Defaults to -1 (time-based random number).
algorithm The algorithm to use to generate rules. Must be one of: "AUTO", "DRF", "GBM". Defaults to AUTO.
min_rule_length Minimum length of rules. Defaults to 3.
max_rule_length Maximum length of rules. Defaults to 3.
max_num_rules The maximum number of rules to return. defaults to -1 which means the number of rules is selected by diminishing returns in model deviance. Defaults to -1.
model_type Specifies type of base learners in the ensemble. Must be one of: "rules_and_linear", "rules", "linear". Defaults to rules_and_linear.
weights_column Column with observation weights. Giving some observation a weight of zero is equivalent to excluding it from the dataset; giving an observation a relative weight of 2 is equivalent to repeating that row twice. Negative weights are not allowed. Note: Weights are per-row observation weights and do not increase the size of the data frame. This is typically the number of times a row is repeated, but non-integer values are supported as well. During training, rows with higher weights matter more, due to the larger loss function pre-factor.
distribution Distribution function Must be one of: "AUTO", "bernoulli", "multinomial", "gaussian", "poisson", "gamma", "tweedie", "laplace", "quantile", "huber". Defaults to AUTO.
rule_generation_ntrees specifies the number of trees to build in the tree model. Defaults to 50. Defaults to 50.
Examples

```r
## Not run:
library(h2o)
h2o.init()

# Import the titanic dataset:
f <- "https://s3.amazonaws.com/h2o-public-test-data/smalldata/gbm_test/titanic.csv"
coltypes <- list(by.col.name = c("pclass", "survived"), types=c("Enum", "Enum"))
df <- h2o.importFile(f, col.types = coltypes)

# Split the dataset into train and test
splits <- h2o.splitFrame(data = df, ratios = 0.8, seed = 1)
train <- splits[[1]]
test <- splits[[2]]

# Set the predictors and response; set the factors:
response <- "survived"
predictors <- c("age", "sibsp", "parch", "fare", "sex", "pclass")

# Build and train the model:
rfit <- h2o.rulefit(y = response,
                   x = predictors,
                   training_frame = train,
                   max_rule_length = 10,
                   max_num_rules = 100,
                   seed = 1)

# Retrieve the rule importance:
print(rfit@model$rule_importance)

# Predict on the test data:
h2o.predict(rfit, newdata = test)
## End(Not run)
```

h2o.runif

**Produce a Vector of Random Uniform Numbers**

**Description**

 Creates a vector of random uniform numbers equal in length to the length of the specified H2O dataset.

**Usage**

```r
h2o.runif(x, seed = -1)
```
**h2o.saveGrid**

**Arguments**

- **x**
  An H2OFrame object.

- **seed**
  A random seed used to generate draws from the uniform distribution.

**Value**

A vector of random, uniformly distributed numbers. The elements are between 0 and 1.

**Examples**

```r
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.importFile(path = prostate_path)
s <- h2o.runif(prostate)
summary(s)

prostate_train <- prostate[s <= 0.8,]
prostate_test <- prostate[s > 0.8,]
nrow(prostate_train) + nrow(prostate_test)

## End(Not run)
```

---

**Description**

Returns a reference to the saved Grid.

**Usage**

```r
h2o.saveGrid(
  grid_directory,
  grid_id,
  save_params_references = FALSE,
  export_cross_validation_predictions = FALSE
)
```

**Arguments**

- **grid_directory**
  A character string containing the path to the folder for the grid to be saved to.

- **grid_id**
  A character string with identification of the grid to be saved.

- **save_params_references**
  A logical indicating if objects referenced by grid parameters (e.g. training frame, calibration frame) should also be saved.
export_cross_validation_predictions

A logical indicating whether exported model artifacts should also include CV holdout Frame predictions.

Value

Returns an object that is a subclass of H2OGrid.

Examples

```r
## Not run:
library(h2o)
h2o.init()

iris <- as.h2o(iris)

ntrees_opts = c(1, 5)
learn_rate_opts = c(0.1, 0.01)
size_of_hyper_space = length(ntrees_opts) * length(learn_rate_opts)

hyper_parameters = list(ntrees = ntrees_opts, learn_rate = learn_rate_opts)
# Tempdir is chosen arbitrarily. May be any valid folder on an H2O-supported filesystem.
baseline_grid <- h2o.grid(algorithm = "gbm",
                      grid_id = "gbm_grid_test",
                      x = 1:4,
                      y = 5,
                      training_frame = iris,
                      hyper_params = hyper_parameters)

grid_path <- h2o.saveGrid(grid_directory = tempdir(), grid_id = baseline_grid@grid_id)
# Remove everything from the cluster or restart it
h2o.removeAll()
grid <- h2o.loadGrid(grid_path)
## End(Not run)
```

h2o.saveModel

`Save an H2O Model Object to Disk`

Description

Save an H2OModel to disk. (Note that ensemble binary models can be saved.)

Usage

```r
h2o.saveModel(
  object,
  path = "",
  force = FALSE,
  export_cross_validation_predictions = FALSE
)
```
Arguments

object an H2OModel object.
path string indicating the directory the model will be written to.
force logical, indicates how to deal with files that already exist.
export_cross_validation_predictions

Details

In the case of existing files force = TRUE will overwrite the file. Otherwise, the operation will fail. The owner of the file saved is the user by which H2O cluster was executed.

See Also

h2o.loadModel for loading a model to H2O from disk

Examples

```
## Not run:
# library(h2o)
# h2o.init()
# prostate <- h2o.importFile(path = paste("https://raw.github.com",
# "h2oai/h2o-2/master/smallData/logreg/prostate.csv", sep = "/"))
# prostate_glm <- h2o.glm(y = "CAPSULE", x = c("AGE", "RACE", "PSA", "DCAPS"),
# training_frame = prostate, family = "binomial", alpha = 0.5)
# h2o.saveModel(object = prostate_glm, path = "/Users/UserName/Desktop", force = TRUE)

## End(Not run)
```

---

**h2o.saveModelDetails**  
*Save an H2O Model Details*

**Description**

Save Model Details of an H2O Model in JSON Format

**Usage**

```r
h2o.saveModelDetails(object, path = "", force = FALSE)
```

**Arguments**

object an H2OModel object.
path string indicating the directory the model details will be written to.
force logical, indicates how to deal with files that already exist.
Details

Model Details will download as a JSON file. In the case of existing files `force = TRUE` will overwrite the file. Otherwise, the operation will fail.

Examples

```r
## Not run:
# library(h2o)
# h2o.init()
# prostate <- h2o.uploadFile(path = system.file("extdata", "prostate.csv", package = "h2o"))
# prostate_glm <- h2o.glm(y = "CAPSULE", x = c("AGE", "RACE", "PSA", "DCAPS"),
#                         training_frame = prostate, family = "binomial", alpha = 0.5)
# h2o.saveModelDetails(object = prostate_glm, path = "/Users/UserName/Desktop", force = TRUE)
## End(Not run)
```

---

**h2o.saveMojo**

*Deprecated - use h2o.save_mojo instead.* Save an H2O Model Object as Mojo to Disk

### Description

Save an MOJO (Model Object, Optimized) to disk.

### Usage

```r
h2o.saveMojo(object, path = "", force = FALSE)
```

### Arguments

- `object` an H2OModel object.
- `path` string indicating the directory the model will be written to.
- `force` logical, indicates how to deal with files that already exist.

### Details

MOJO will download as a zip file. In the case of existing files `force = TRUE` will overwrite the file. Otherwise, the operation will fail.

### See Also

h2o.saveModel for saving a model to disk as a binary object.
Examples

```r
## Not run:
# library(h2o)
# h2o.init()
# prostate <- h2o.uploadFile(path = system.file("extdata", "prostate.csv", package="h2o"))
# prostate_glm <- h2o.glm(y = "CAPSULE", x = c("AGE", "RACE", "PSA", "DCAPS"),
# training_frame = prostate, family = "binomial", alpha = 0.5)
# h2o.saveMojo(object = prostate_glm, path = "/Users/UserName/Desktop", force = TRUE)

## End(Not run)
```

---

**h2o.save_frame**

Store frame data in H2O’s native format.

### Description

Store frame data in H2O’s native format.

### Usage

```r
h2o.save_frame(x, dir, force = TRUE)
```

### Arguments

- **x**: An H2OFrame object
- **dir**: a filesystem location where to write frame data (hdfs, nfs)
- **force**: logical. overwrite already existing files (defaults to true)

### Examples

```r
## Not run:
library(h2o)
h2o.init()

prostate_path = system.file("extdata", "prostate.csv", package = "h2o")
prostate = h2o.importFile(path = prostate_path)
h2o.save_frame(prostate, "/tmp/prostate"

## End(Not run)
```
298

h2o.save_mojo

h2o.save_mojo

Save an H2O Model Object as Mojo to Disk

Description
Save an MOJO (Model Object, Optimized) to disk.

Usage
h2o.save_mojo(object, path = "", force = FALSE)

Arguments
object

an H2OModel object.

path

string indicating the directory the model will be written to.

force

logical, indicates how to deal with files that already exist.

Details
MOJO will download as a zip file. In the case of existing files force = TRUE will overwrite the file.
Otherwise, the operation will fail.

See Also
h2o.saveModel for saving a model to disk as a binary object.

Examples
## Not run:
# library(h2o)
# h2o.init()
# prostate <- h2o.uploadFile(path = system.file("extdata", "prostate.csv", package="h2o"))
# prostate_glm <- h2o.glm(y = "CAPSULE", x = c("AGE", "RACE", "PSA", "DCAPS"),
#
training_frame = prostate, family = "binomial", alpha = 0.5)
# h2o.save_mojo(object = prostate_glm, path = "/Users/UserName/Desktop", force = TRUE)
## End(Not run)


h2o.save_to_hive  
Save contents of this data frame into a Hive table

Description
For example, h2o.save_to_hive(data_frame, "jdbc:hive2://host:10000/database", "table_name") h2o.save_to_hive(data_frame, "jdbc:hive2://host:10000/", "database.table_name", format = "parquet")

Usage
```
h2o.save_to_hive(
    data,
    jdbc_url,
    table_name,
    format = "csv",
    table_path = NULL,
    tmp_path = NULL
)
```

Arguments
- **data**: A H2O Frame object to be saved.
- **jdbc_url**: Hive JDBC connection URL.
- **table_name**: Table name into which to store the data. The table must not exist as it will be created.
- **format**: Storage format of created Hive table. (default csv, can be csv or parquet)
- **table_path**: If specified, the table will be created as an external table and this is where the data
- **tmp_path**: Path where to store temporary data.

h2o.scale  
Scaling and Centering of an H2OFrame

Description
Centers and/or scales the columns of an H2O dataset.

Usage
```
h2o.scale(x, center = TRUE, scale = TRUE, inplace = FALSE)
```
Arguments

- **x**: An H2OFrame object.
- **center**: either a logical value or numeric vector of length equal to the number of columns of x.
- **scale**: either a logical value or numeric vector of length equal to the number of columns of x.
- **inplace**: a logical values indicating whether directly overwrite original data (disabled by default). Exposed for backwards compatibility (prior versions of this functions were always doing an inplace update).

Examples

```r
## Not run:
library(h2o)
h2o.init()
iris_hf <- as.h2o(iris)
summary(iris_hf)

# Scale and center all the numeric columns in iris data set
iris_scaled <- h2o.scale(iris_hf[, 1:4])
```

---

h2o.scoreHistory  Retrieve Model Score History

Description

Retrieve Model Score History

Usage

h2o.scoreHistory(object)

Arguments

- **object**: An H2OModel object.

Examples

```r
## Not run:
library(h2o)
h2o.init()

cars <- h2o.importFile(f)
cars["economy_20mpg"] <- as.factor(cars["economy_20mpg"])
predictors <- c("displacement", "power", "weight", "acceleration", "year")
```
response <- "economy_20mpg"
cars_split <- h2o.splitFrame(data = cars, ratios = 0.8, seed = 1234)
train <- cars_split[[1]]
valid <- cars_split[[2]]
cars_gbm <- h2o.gbm(x = predictors, y = response,
    training_frame = train,
    validation_frame = valid,
    seed = 1234)
h2o.scoreHistory(cars_gbm)

## End(Not run)

---

**h2o.scoreHistoryGAM**

*Retrieve GLM Model Score History buried in GAM model*

**Description**

Retrieve GLM Model Score History buried in GAM model

**Usage**

h2o.scoreHistoryGAM(object)

**Arguments**

- object: An H2OModel object.

---

**h2o.sd**

*Standard Deviation of a column of data.*

**Description**

Obtain the standard deviation of a column of data.

**Usage**

h2o.sd(x, na.rm = FALSE)

sd(x, na.rm = FALSE)

**Arguments**

- x: An H2OFrame object.
- na.rm: logical. Should missing values be removed?
See Also

`h2o.var` for variance, and `sd` for the base R implementation.

Examples

```r
## Not run:
library(h2o)
ml.init()

prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
sd(prostate$AGE)

## End(Not run)
```

---

**h2o.sdev**  
*Retrieve the standard deviations of principal components*

Description

Retrieve the standard deviations of principal components

Usage

`h2o.sdev(object)`

Arguments

`object`  
An `H2ODimReductionModel` object.

Examples

```r
## Not run:
library(h2o)
ml.init()

cars <- h2o.importFile(f)
predictors <- c("displacement", "power", "weight", "acceleration", "year")
cars_pca <- h2o.prcomp(cars, transform = "STANDARDIZE",
                      k = 3, x = predictors, seed = 12345)

h2o.sdev(cars_pca)

## End(Not run)
```
**h2o.setLevels**  
*Set Levels of H2O Factor Column*

**Description**
Works on a single categorical vector. New domains must be aligned with the old domains. This call has SIDE EFFECTS and mutates the column in place (change of the levels will also affect all the frames that are referencing this column). If you want to make a copy of the column instead, use parameter in.place = FALSE.

**Usage**

```r
h2o.setLevels(x, levels, in.place = TRUE)
```

**Arguments**
- `x`: A single categorical column.
- `levels`: A character vector specifying the new levels. The number of new levels must match the number of old levels.
- `in.place`: Indicates whether new domain will be directly applied to the column (in place change) or if a copy of the column will be created with the given domain levels.

**Examples**

```r
## Not run:
library(h2o)
h2o.init()
iris_hf <- as.h2o(iris)
new_levels <- c("setosa", "versicolor", "caroliniana")
iris_hf$Species <- h2o.setLevels(iris_hf$Species, new_levels, in.place = FALSE)
h2o.levels(iris_hf$Species)
## End(Not run)
```

---

**h2o.setTimezone**  
*Set the Time Zone on the H2O cluster*

**Description**
Set the Time Zone on the H2O cluster

**Usage**

```r
h2o.setTimezone(tz)
```
Arguments

tz The desired timezone.

Examples

## Not run:
library(h2o)
h2o.init()

h2o.setTimezone("America/Juneau")
h2o.getTimezone()

## End(Not run)

h2o.set_s3_credentials

Creates a new Amazon S3 client internally with specified credentials.

Description

There are no validations done to the credentials. Incorrect credentials are thus revealed with first S3 import call.

Usage

h2o.set_s3_credentials(secretKeyId, secretAccessKey, sessionToken = NULL)

Arguments

secretKeyId Amazon S3 Secret Key ID (provided by Amazon)
secretAccessKey Amazon S3 Secret Access Key (provided by Amazon)
sessionToken Amazon Session Token (optional, only when using AWS Temporary Credentials)

h2o.shap_explain_row_plot

SHAP Local Explanation

Description

SHAP explanation shows contribution of features for a given instance. The sum of the feature contributions and the bias term is equal to the raw prediction of the model, i.e., prediction before applying inverse link function. H2O implements TreeSHAP which when the features are correlated, can increase contribution of a feature that had no influence on the prediction.
Usage

h2o.shap_explain_row_plot(
  model,
  newdata,
  row_index,
  columns = NULL,
  top_n_features = 10,
  plot_type = c("barplot", "breakdown"),
  contribution_type = c("both", "positive", "negative")
)

Arguments

model An H2O tree-based model. This includes Random Forest, GBM and XGboost only. Must be a binary classification or regression model.
newdata An H2O Frame, used to determine feature contributions.
row_index Instance row index.
columns List of columns or list of indices of columns to show. If specified, then the top_n_features parameter will be ignored.
top_n_features Integer specifying the maximum number of columns to show (ranked by their contributions). When plot_type = "barplot", then top_n_features features will be chosen for each contribution_type.
plot_type Either "barplot" or "breakdown". Defaults to "barplot".
contribution_type When plot_type == "barplot", plot one of "negative", "positive", or "both" contributions. Defaults to "both".

Value

A ggplot2 object.

Examples

## Not run:
library(h2o)
h2o.init()

# Import the wine dataset into H2O:
df <- h2o.importFile(f)

# Set the response
response <- "quality"

# Split the dataset into a train and test set:
splits <- h2o.splitFrame(df, ratios = 0.8, seed = 1)
train <- splits[[1]]
test <- splits[[2]]
# Build and train the model:
```r
gbm <- h2o.gbm(y = response,
               training_frame = train)
```

# Create the SHAP row explanation plot
```r
shap_explain_row_plot <- h2o.shap_explain_row_plot(gbm, test, row_index = 1)
print(shap_explain_row_plot)
```

## End(Not run)

---

**h2o.shap_summary_plot**  
*SHAP Summary Plot*

**Description**

SHAP summary plot shows the contribution of the features for each instance (row of data). The sum of the feature contributions and the bias term is equal to the raw prediction of the model, i.e., prediction before applying inverse link function.

**Usage**

```r
h2o.shap_summary_plot(
  model,  
  newdata,  
  columns = NULL,  
  top_n_features = 20,  
  sample_size = 1000
)
```

**Arguments**

- **model**  
  An H2O tree-based model. This includes Random Forest, GBM and XGboost only. Must be a binary classification or regression model.
- **newdata**  
  An H2O Frame, used to determine feature contributions.
- **columns**  
  List of columns or list of indices of columns to show. If specified, then the top_n_features parameter will be ignored.
- **top_n_features**  
  Integer specifying the maximum number of columns to show (ranked by variable importance).
- **sample_size**  
  Integer specifying the maximum number of observations to be plotted.

**Value**

A ggplot2 object
Examples

```r
## Not run:
library(h2o)
h2o.init()

# Import the wine dataset into H2O:
df <- h2o.importFile(f)

# Set the response
t <- "quality"

# Split the dataset into a train and test set:
splits <- h2o.splitFrame(df, ratios = 0.8, seed = 1)
train <- splits[[1]]
test <- splits[[2]]

# Build and train the model:
gbm <- h2o.gbm(y = response,
              training_frame = train)

# Create the SHAP summary plot
shap_summary_plot <- h2o.shap_summary_plot(gbm, test)
print(shap_summary_plot)

## End(Not run)
```

---

### h2o.show_progress

#### Enable Progress Bar

**Description**

Enable Progress Bar

**Usage**

```r
h2o.show_progress()
```

**Examples**

```r
## Not run:
library(h2o)
h2o.init()
h2o.no_progress()

iris <- h2o.importFile(f)
iris[["class"]]<- as.factor(iris["class"])
predictors <- c("sepal_len", "sepal_wid", "petal_len", "petal_wid")
```
splits <- h2o.splitFrame(iris, ratios = 0.8, seed = 1234)
train <- splits[[1]]
valid <- splits[[2]]
h2o.show_progress()

iris_km <- h2o.kmeans(x = predictors,
                      training_frame = train,
                      validation_frame = valid,
                      k = 10, estimate_k = TRUE,
                      standardize = FALSE, seed = 1234)

## End(Not run)

---

### h2o.shutdown

**Shut Down H2O Instance**

**Description**

Shut down the specified instance. All data will be lost.

**Usage**

```r
h2o.shutdown(prompt = TRUE)
```

**Arguments**

- `prompt`: A logical value indicating whether to prompt the user before shutting down the H2O server.

**Details**

This method checks if H2O is running at the specified IP address and port, and if it is, shuts down that H2O instance.

**WARNING**

All data, models, and other values stored on the server will be lost! Only call this function if you and all other clients connected to the H2O server are finished and have saved your work.

**Note**

Users must call `h2o.shutdown` explicitly in order to shut down the local H2O instance started by `R`. If `R` is closed before H2O, then an attempt will be made to automatically shut down H2O. This only applies to local instances started with `h2o.init`, not remote H2O servers.

**See Also**

- `h2o.init`
h2o.signif

### Examples

```r
# Don't run automatically to prevent accidentally shutting down a cluster
## Not run:
library(h2o)
h2o.init()
h2o.shutdown()

## End(Not run)
```

---

**h2o.signif**

*Round doubles/floats to the given number of significant digits.*

**Description**

Round doubles/floats to the given number of significant digits.

**Usage**

```r
h2o.signif(x, digits = 6)
signif(x, digits = 6)
```

**Arguments**

- `x` - An H2OFrame object.
- `digits` - Number of significant digits to round doubles/floats.

**See Also**

- `Round` for the base R implementation, `signif()`.

**Examples**

```r
## Not run:
library(h2o)
h2o.init()

f <- "https://s3.amazonaws.com/h2o-public-test-data/smalldata/coxph_test/heart.csv"
heart <- h2o.importFile(f)

h2o.signif(heart["age"], digits = 3)

## End(Not run)
```
### h2o.sin

**Description**

Compute the sine of x

**Usage**

```r
h2o.sin(x)
```

**Arguments**

- **x**: An H2OFrame object.

**See Also**

- `Trig` for the base R implementation, `sin()`.

**Examples**

```r
## Not run:
library(h2o)
h2o.init()
frame <- h2o.createFrame(rows = 6, cols = 2,
categorical_fraction = 0.0,
missing_fraction = 0.7,
seed = 123)
h2o.sin(frame)
## End(Not run)
```

---

### h2o.skewness

**Description**

Obtain the skewness of a column of a parsed H2O data object.

**Usage**

```r
h2o.skewness(x, ..., na.rm = TRUE)
skewness.H2OFrame(x, ..., na.rm = TRUE)
```
### h2o.splitFrame

#### Split an H2O Data Set

**Description**

Split an existing H2O data set according to user-specified ratios. The number of subsets is always 1 more than the number of given ratios. Note that this does not give an exact split. H2O is designed to be efficient on big data using a probabilistic splitting method rather than an exact split. For example, when specifying a split of 0.75/0.25, H2O will produce a test/train split with an expected value of 0.75/0.25 rather than exactly 0.75/0.25. On small datasets, the sizes of the resulting splits will deviate from the expected value more than on big data, where they will be very close to exact.

**Usage**

```r
h2o.splitFrame(data, ratios = 0.75, destination_frames, seed = -1)
```

**Arguments**

- `data`: An H2OFrame object, to be split.
- `ratios`: A numeric value or array indicating the ratio of total rows contained in each split. Must total up to less than 1. e.g. `c(0.8)` for 80/20 split.
- `destination_frames`: An array of frame IDs equal to the number of values specified in the ratios array, plus one.
- `seed`: Random seed.
Value

Returns a list of split H2O Frames

Examples

```r
## Not run:
library(h2o)
h2o.init()
iris_hf <- as.h2o(iris)
iris_split <- h2o.splitFrame(iris_hf, ratios = c(0.2, 0.5))
head(iris_split[[1]])
summary(iris_split[[1]])
## End(Not run)
```

---

### h2o.sqrt

*Compute the square root of x*

Description

Compute the square root of x

Usage

```r
h2o.sqrt(x)
```

Arguments

- `x`: An H2OFrame object.

See Also

- `MathFun` for the base R implementation, `sqrt()`.

Examples

```r
## Not run:
library(h2o)
h2o.init()
frame <- h2o.createFrame(rows = 6, cols = 2,
categorical_fraction = 0.0,
missing_fraction = 0.7,
seed = 123)
h2o.sqrt(frame)
## End(Not run)
```
h2o.stackedEnsemble

Builds a Stacked Ensemble

Description

Build a stacked ensemble (aka. Super Learner) using the H2O base learning algorithms specified by the user.

Usage

```r
h2o.stackedEnsemble(
  x,
  y,
  training_frame,
  model_id = NULL,
  validation_frame = NULL,
  blending_frame = NULL,
  base_models = list(),
  metalearner_algorithm = c("AUTO", "deelearning", "drf", "gbm", "glm", "naivebays", "xgboost"),
  metalearner_nfolds = 0,
  metalearner_fold_assignment = c("AUTO", "Random", "Modulo", "Stratified"),
  metalearner_fold_column = NULL,
  metalearner_params = NULL,
  metalearner_transform = c("NONE", "Logit"),
  max_runtime_secs = 0,
  weights_column = NULL,
  offset_column = NULL,
  seed = -1,
  score_training_samples = 10000,
  keep_levelone_frame = FALSE,
  export_checkpoints_dir = NULL,
  auc_type = c("AUTO", "NONE", "MACRO_OVR", "WEIGHTED_OVR", "MACRO_OVO", "WEIGHTED_OVO")
)
```

Arguments

`x` *(Optional).* A vector containing the names or indices of the predictor variables to use in building the model. If `x` is missing, then all columns except `y` are used. Training frame is used only to compute ensemble training metrics.

`y` The name or column index of the response variable in the data. The response must be either a numeric or a categorical_FACTOR variable. If the response is numeric, then a regression model will be trained, otherwise it will train a classification model.

`training_frame` Id of the training data frame.
model_id  
Destination id for this model; auto-generated if not specified.

validation_frame  
Id of the validation data frame.

blending_frame  
Frame used to compute the predictions that serve as the training frame for the metalearners (triggers blending mode if provided)

base_models  
List of models or grids (or their ids) to ensemble/stack together. Grids are expanded to individual models. If not using blending frame, then models must have been cross-validated using nfolds > 1, and folds must be identical across models.

metalearners_algorithm  
Type of algorithm to use as the metalearners. Options include 'AUTO' (GLM with non negative weights; if validation_frame is present, a lambda search is performed), 'deeplearning' (Deep Learning with default parameters), 'drf' (Random Forest with default parameters), 'gbm' (GBM with default parameters), 'glm' (GLM with default parameters), 'naivebayes' (NaiveBayes with default parameters), or 'xgboost' (if available, XGBoost with default parameters). Must be one of: "AUTO", "deeplearning", "drf", "gbm", "glm", "naivebayes", "xgboost". Defaults to AUTO.

metalearners_nfolds  
Number of folds for K-fold cross-validation of the metalearners algorithm (0 to disable or >= 2). Defaults to 0.

metalearners_fold_assignment  
Cross-validation fold assignment scheme for metalearners cross-validation. Defaults to AUTO (which is currently set to Random). The 'Stratified' option will stratify the folds based on the response variable, for classification problems. Must be one of: "AUTO", "Random", "Modulo", "Stratified".

metalearners_fold_column  
Column with cross-validation fold index assignment per observation for cross-validation of the metalearners.

metalearners_params  
Parameters for metalearners algorithm

metalearners_transform  
Transformation used for the level one frame. Must be one of: "NONE", "Logit". Defaults to NONE.

max_runtime_secs  
Maximum allowed runtime in seconds for model training. Use 0 to disable. Defaults to 0.

weights_column  
Column with observation weights. Giving some observation a weight of zero is equivalent to excluding it from the dataset; giving an observation a relative weight of 2 is equivalent to repeating that row twice. Negative weights are not allowed. Note: Weights are per-row observation weights and do not increase the size of the data frame. This is typically the number of times a row is repeated, but non-integer values are supported as well. During training, rows with higher weights matter more, due to the larger loss function pre-factor.

offset_column  
Offset column. This will be added to the combination of columns before applying the link function.
seed  Seed for random numbers; passed through to the metalearner algorithm. Defaults to -1 (time-based random number).

score_training_samples
Specify the number of training set samples for scoring. The value must be >= 0.
To use all training samples, enter 0. Defaults to 10000.

keep_levelone_frame
Logical. Keep level one frame used for metalearner training. Defaults to FALSE.

export_checkpoints_dir
Automatically export generated models to this directory.

auc_type
Set default multinomial AUC type. Must be one of: "AUTO", "NONE", "MACRO_OVR",
"WEIGHTED_OVR", "MACRO_OVO", "WEIGHTED_OVO". Defaults to AUTO.

Examples

## Not run:
library(h2o)
h2o.init()

# Import a sample binary outcome train/test set
train <- h2o.importFile("https://s3.amazonaws.com/erin-data/higgs/higgs_train_10k.csv")
test <- h2o.importFile("https://s3.amazonaws.com/erin-data/higgs/higgs_test_5k.csv")

# Identify predictors and response
y <- "response"
x <- setdiff(names(train), y)

# For binary classification, response should be a factor
train[, y] <- as.factor(train[, y])
test[, y] <- as.factor(test[, y])

# Number of CV folds
nfolds <- 5

# Train & Cross-validate a GBM
my_gbm <- h2o.gbm(x = x,
y = y,
                 training_frame = train,
distribution = "bernoulli",
                 ntrees = 10,
                 max_depth = 3,
                 min_rows = 2,
                 learn_rate = 0.2,
                 nfolds = nfolds,
                 fold_assignment = "Modulo",
                 keep_cross_validation_predictions = TRUE,
                 seed = 1)

# Train & Cross-validate a RF
my_rf <- h2o.randomForest(x = x,
y = y,
h2o.startLogging

Start Writing H2O R Logs

Description

Begin logging H2o R POST commands and error responses to local disk. Used primarily for debugging purposes.

Usage

h2o.startLogging(file)

Arguments

file a character string name for the file, automatically generated

See Also

h2o.stopLogging, h2o.clearLog, h2o.openLog

Examples

## Not run:
library(h2o)
h2o.init()
h2o.startLogging()
australia_path = system.file("extdata", "australia.csv", package = "h2o")
australia = h2o.importFile(path = australia_path)
h2o.stopLogging()

## End(Not run)
h2o.std_coef_plot

Plot Standardized Coefficient Magnitudes

Description

Plot a GLM model’s standardized coefficient magnitudes.

Usage

h2o.std_coef_plot(model, num_of_features = NULL)

Arguments

model A trained generalized linear model
num_of_features The number of features to be shown in the plot

See Also

h2o.varimp_plot for variable importances plot of random forest, GBM, deep learning.

Examples

## Not run:
library(h2o)
h2o.init()

prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.importFile(prostate_path)
prostate[, 2] <- as.factor(prostate[, 2])
prostate_glm <- h2o.glm(y = "CAPSULE", x = c("AGE", "RACE", "PSA", "DCAPS"),
training_frame = prostate, family = "binomial",
nfolds = 0, alpha = 0.5, lambda_search = FALSE)
h2o.std_coef_plot(prostate_glm)

## End(Not run)

h2o.stopLogging

Stop Writing H2O R Logs

Description

Halt logging of H2O R POST commands and error responses to local disk. Used primarily for debugging purposes.
Usage

h2o.stopLogging()

See Also

h2o.startLogging, h2o.clearLog, h2o.openLog

Examples

## Not run:
library(h2o)
h2o.init()
h2o.startLogging()
australia_path = system.file("extdata", "australia.csv", package = "h2o")
australia = h2o.importFile(path = australia_path)
h2o.stopLogging()

## End(Not run)

-------------

h2o.str

*Display the structure of an H2OFrame object*

Description

Display the structure of an H2OFrame object

Usage

h2o.str(object, ..., cols = FALSE)

Arguments

object An H2OFrame.

... Further arguments to be passed from or to other methods.

cols Print the per-column str for the H2OFrame

Examples

## Not run:
library(h2o)
h2o.init()

frame <- h2o.createFrame(rows = 6, cols = 2,
categorical_fraction = 0.0,
missing_fraction = 0.7,
seed = 123)
h2o.str(frame, cols = FALSE)

## End(Not run)
h2o.stringdist

**Compute element-wise string distances between two H2OFrames**

**Description**

Compute element-wise string distances between two H2OFrames. Both frames need to have the same shape (N x M) and only contain string/factor columns. Return a matrix (H2OFrame) of shape N x M.

**Usage**

```r
h2o.stringdist(
  x,
  y,
  method = c("lv", "lcs", "qgram", "jaccard", "jw", "soundex"),
  compare_empty = TRUE
)
```

**Arguments**

- **x**: An H2OFrame
- **y**: A comparison H2OFrame
- **method**: A string identifier indicating what string distance measure to use. Must be one of: "lv" - Levenshtein distance "lcs" - Longest common substring distance "qgram" - q-gram distance "jaccard" - Jaccard distance between q-gram profiles "jw" - Jaro, or Jaro-Winker distance "soundex" - Distance based on soundex encoding
- **compare_empty**: if set to FALSE, empty strings will be handled as NaNs

**Examples**

```r
## Not run:
h2o.init()
x <- as.h2o(c("Martha", "Dwayne", "Dixon"))
y <- as.character(as.h2o(c("Marhta", "Duane", "Dicksonx")))
h2o.stringdist(x, y, method = "jw")

## End(Not run)
```
h2o.strsplit  

*String Split*

**Description**

String Split

**Usage**

h2o.strsplit(x, split)

**Arguments**

- x: The column whose strings must be split.
- split: The pattern to split on.

**Value**

An H2OFrame where each column is the outcome of the string split.

**Examples**

```r
## Not run:
library(h2o)
h2o.init()
string_to_split <- as.h2o("Split at every character.")
split_string <- h2o.strsplit(string_to_split, ")

## End(Not run)
```

---

h2o.sub  

*String Substitute*

**Description**

Creates a copy of the target column in which each string has the first occurrence of the regex pattern replaced with the replacement substring.

**Usage**

h2o.sub(pattern, replacement, x, ignore.case = FALSE)
h2o.substring

Arguments

pattern The pattern to replace.
replacement The replacement pattern.
x The column on which to operate.
ignore.case Case sensitive or not

Examples

## Not run:
library(h2o)
h2o.init()
string_to_sub <- as.h2o("r tutorial")
sub_string <- h2o.sub("r ", "H2O ", string_to_sub)

## End(Not run)

h2o.substring Substring

Description

Returns a copy of the target column that is a substring at the specified start and stop indices, inclusive. If the stop index is not specified, then the substring extends to the end of the original string. If start is longer than the number of characters in the original string, or is greater than stop, an empty string is returned. Negative start is coerced to 0.

Usage

h2o.substring(x, start, stop = "[]")

h2o.substr(x, start, stop = "[]")

Arguments

x The column on which to operate.
start The index of the first element to be included in the substring.
stop Optional, The index of the last element to be included in the substring.

Examples

## Not run:
library(h2o)
h2o.init()
string_to_substring <- as.h2o("1234567890")
substr <- h2o.substring(string_to_substring, 2) #Get substring from second index onwards

## End(Not run)
Compute the frame’s sum by-column (or by-row).

Description
Compute the frame’s sum by-column (or by-row).

Usage
h2o.sum(x, na.rm = FALSE, axis = 0, return_frame = FALSE)

Arguments
x
An H2OFrame object.

na.rm
logical. indicating whether missing values should be removed.

axis
An int that indicates whether to do down a column (0) or across a row (1). For row or column sums, the return_frame parameter must be TRUE.

return_frame
A boolean that indicates whether to return an H2O frame or one single aggregated value. Default is FALSE.

See Also
sum for the base R implementation.

Examples
## Not run:
library(h2o)
h2o.init()

frame <- h2o.createFrame(rows = 6, cols = 2,
categorical_fraction = 0.0,
missing_fraction = 0.7,
seed = 123)
h2o.sum(frame["C1"], na.rm = TRUE, axis = 0, return_frame = TRUE)

## End(Not run)
h2o.summary

Summarizes the columns of an H2OFrame.

Description

A method for the summary generic. Summarizes the columns of an H2O data frame or subset of columns and rows using vector notation (e.g. dataset[row, col]).

Usage

h2o.summary(object, factors = 6L, exact_quantiles = FALSE, ...)

## S3 method for class 'H2OFrame'
summary(object, factors, exact_quantiles, ...)

Arguments

object
  An H2OFrame object.
factors
  The number of factors to return in the summary. Default is the top 6.
exact_quantiles
  Compute exact quantiles or use approximation. Default is to use approximation.
...
  Further arguments passed to or from other methods.

Details

By default it uses approximated version of quantiles computation, however, user can modify this behavior by setting up exact_quantiles argument to true.

Value

A table displaying the minimum, 1st quartile, median, mean, 3rd quartile and maximum for each numeric column, and the levels and category counts of the levels in each categorical column.

Examples

## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.importFile(path = prostate_path)
summary(prostate)
summary(prostate$GLEASON)
summary(prostate[, 4:6])
summary(prostate, exact_quantiles = TRUE)

## End(Not run)
**h2o.svd**  
* Singular value decomposition of an H2O data frame using the power method

**Description**
Singular value decomposition of an H2O data frame using the power method

**Usage**

```r
h2o.svd(
  training_frame,
  x,
  destination_key,
  model_id = NULL,
  validation_frame = NULL,
  ignore_const_cols = TRUE,
  score_each_iteration = FALSE,
  transform = c("NONE", "STANDARDIZE", "NORMALIZE", "DEMEAN", "DESCALE"),
  svd_method = c("GramSVD", "Power", "Randomized"),
  nv = 1,
  max_iterations = 1000,
  seed = -1,
  keep_u = TRUE,
  u_name = NULL,
  use_all_factor_levels = TRUE,
  max_runtime_secs = 0,
  export_checkpoints_dir = NULL
)
```

**Arguments**

- `training_frame`  
  Id of the training data frame.

- `x`  
  A vector containing the character names of the predictors in the model.

- `destination_key`  
  (Optional) The unique key assigned to the resulting model. Automatically generated if none is provided.

- `model_id`  
  Destination id for this model; auto-generated if not specified.

- `validation_frame`  
  Id of the validation data frame.

- `ignore_const_cols`  
  Logical. Ignore constant columns. Defaults to TRUE.

- `score_each_iteration`  
  Logical. Whether to score during each iteration of model training. Defaults to FALSE.
**h2o.svd**

**transform** Transformation of training data Must be one of: "NONE", "STANDARDIZE", "NORMALIZE", "DEMEAN", "DESCALE". Defaults to NONE.

**svd_method** Method for computing SVD (Caution: Randomized is currently experimental and unstable) Must be one of: "GramSVD", "Power", "Randomized". Defaults to GramSVD.

**nv** Number of right singular vectors Defaults to 1.

**max_iterations** Maximum iterations Defaults to 1000.

**seed** Seed for random numbers (affects certain parts of the algo that are stochastic and those might or might not be enabled by default). Defaults to -1 (time-based random number).

**keep_u** Logical. Save left singular vectors? Defaults to TRUE.

**u_name** Frame key to save left singular vectors

**use_all_factor_levels** Logical. Whether first factor level is included in each categorical expansion Defaults to TRUE.

**max_runtime_secs** Maximum allowed runtime in seconds for model training. Use 0 to disable. Defaults to 0.

**export_checkpoints_dir** Automatically export generated models to this directory.

**Value**

an object of class **H2ODimReductionModel**.

**References**

**Examples**

```R
## Not run:
library(h2o)
h2o.init()
australia_path <- system.file("extdata", "australia.csv", package = "h2o")
australia <- h2o.uploadFile(path = australia_path)
h2o.svd(training_frame = australia, nv = 8)
## End(Not run)
```
Cross Tabulation and Table Creation in H2O

Description

Uses the cross-classifying factors to build a table of counts at each combination of factor levels.

Usage

\[
\text{h2o.table}(x, y = \text{NULL}, \text{dense} = \text{TRUE})
\]

\[
\text{table.H2OFrame}(x, y = \text{NULL}, \text{dense} = \text{TRUE})
\]

Arguments

- **x**: An H2OFrame object with at most two columns.
- **y**: An H2OFrame similar to x, or NULL.
- **dense**: A logical for dense representation, which lists only non-zero counts, 1 combination per row. Set to FALSE to expand counts across all combinations.

Value

Returns a tabulated H2OFrame object.

Examples

```r
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
summary(prostate)

# Counts of the ages of all patients
head(h2o.table(prostate[, 3]))
h2o.table(prostate[, 3])

# Two-way table of ages (rows) and race (cols) of all patients
head(h2o.table(prostate[, c(3, 4)]))
h2o.table(prostate[, c(3, 4)])

## End(Not run)
```
Tabulation between Two Columns of an H2OFrame

Description

Simple Co-Occurrence based tabulation of X vs Y, where X and Y are two Vecs in a given dataset. Uses histogram of given resolution in X and Y. Handles numerical/categorical data and missing values. Supports observation weights.

Usage

h2o.tabulate(data, x, y, weights_column = NULL, nbins_x = 50, nbins_y = 50)

Arguments

data An H2OFrame object.
x predictor column
y response column
weights_column (optional) observation weights column
nbins_x number of bins for predictor column
nbins_y number of bins for response column

Value

Returns two TwoDimTables of 3 columns each count_table: X Y counts response_table: X meanY counts

Examples

```r
## Not run:
library(h2o)
h2o.init()
df <- as.h2o(iris)
tab <- h2o.tabulate(data = df, x = "Sepal.Length", y = "Petal.Width",
                   weights_column = NULL, nbins_x = 10, nbins_y = 10)
plot(tab)

## End(Not run)
```
**h2o.tan**

*Compute the tangent of x*

**Description**

Compute the tangent of x

**Usage**

h2o.tan(x)

**Arguments**

x

An H2OFrame object.

**See Also**

Trig for the base R implementation, `tan()`.

**Examples**

```r
## Not run:
library(h2o)
h2o.init()
frame <- h2o.createFrame(rows = 6, cols = 2,
categorical_fraction = 0.0,
missing_fraction = 0.7,
seed = 123)
h2o.tan(frame)
## End(Not run)
```

**h2o.tanh**

*Compute the hyperbolic tangent of x*

**Description**

Compute the hyperbolic tangent of x

**Usage**

h2o.tanh(x)

**Arguments**

x

An H2OFrame object.
See Also

Hyperbolic for the base R implementation, tanh().

Examples

## Not run:
library(h2o)
h2o.init()

frame <- h2o.createFrame(rows = 6, cols = 2,
categorical_fraction = 0.0,
missing_fraction = 0.7,
seed = 123)
h2o.tanh(frame)

## End(Not run)
Arguments

x  (Optional) A vector containing the names or indices of the predictor variables to use in building the model. If x is missing, then all columns except y are used.

y  The name or column index of the response variable in the data. The response must be either a numeric or a categorical/factor variable. If the response is numeric, then a regression model will be trained, otherwise it will train a classification model.

training_frame  Id of the training data frame.

model_id  Destination id for this model; auto-generated if not specified.

fold_column  Column with cross-validation fold index assignment per observation.

columns_to_encode  List of categorical columns or groups of categorical columns to encode. When groups of columns are specified, each group is encoded as a single column (interactions are created internally).

keep_original_categorical_columns  Logical. If true, the original non-encoded categorical features will remain in the result frame. Defaults to TRUE.

blending  Logical. If true, enables blending of posterior probabilities (computed for a given categorical value) with prior probabilities (computed on the entire set). This allows to mitigate the effect of categorical values with small cardinality. The blending effect can be tuned using the ‘inflection_point’ and ‘smoothing’ parameters. Defaults to FALSE.

inflection_point  Inflection point of the sigmoid used to blend probabilities (see ‘blending’ parameter). For a given categorical value, if it appears less that ‘inflection_point’ in a data sample, then the influence of the posterior probability will be smaller than the prior. Defaults to 10.

smoothing  Smoothing factor corresponds to the inverse of the slope at the inflection point on the sigmoid used to blend probabilities (see ‘blending’ parameter). If smoothing tends towards 0, then the sigmoid used for blending turns into a Heaviside step function. Defaults to 20.

data_leakage_handling  Data leakage handling strategy used to generate the encoding. Supported options are: 1) "none" (default) - no holdout, using the entire training frame. 2) "leave_one_out" - current row’s response value is subtracted from the per-level frequencies pre-calculated on the entire training frame. 3) "k_fold" - encodings for a fold are generated based on out-of-fold data. Must be one of: "leave_one_out", "k_fold", "none", "LeaveOneOut", "KFold", "None". Defaults to None.

noise  The amount of noise to add to the encoded column. Use 0 to disable noise, and -1 (=AUTO) to let the algorithm determine a reasonable amount of noise. Defaults to 0.01.

seed  Seed for random numbers (affects certain parts of the algo that are stochastic and those might or might not be enabled by default). Defaults to -1 (time-based random number).

...  Mainly used for backwards compatibility, to allow deprecated parameters.
Examples

```r
## Not run:
library(h2o)
h2o.init()
#Import the titanic dataset
f <- "https://s3.amazonaws.com/h2o-public-test-data/smalldata/gbm_test/titanic.csv"
titanic <- h2o.importFile(f)

# Set response as a factor
response <- "survived"
titanic[[response]] <- as.factor(titanic[[response]])

# Split the dataset into train and test
splits <- h2o.splitFrame(data = titanic, ratios = .8, seed = 1234)
train <- splits[[1]]
test <- splits[[2]]

# Choose which columns to encode
encode_columns <- c("home.dest", "cabin", "embarked")

# Train a TE model
te_model <- h2o.targetencoder(x = encode_columns,
                               y = response,
                               training_frame = train,
                               fold_column = "pclass",
                               data_leakage_handling = "Kfold")

# New target encoded train and test sets
train_te <- h2o.transform(te_model, train)
test_te <- h2o.transform(te_model, test)
## End(Not run)
```

---

**h2o.target_encode_apply**

*Apply Target Encoding Map to Frame*

**Description**

**Usage**

```r
h2o.target_encode_apply(
  data,
  x,
)```
Arguments

- **data**
  An H2OFrame object with which to apply the target encoding map.

- **x**
  A list containing the names or indices of the variables to encode. A target encoding column will be created for each element in the list. Items in the list can be multiple columns. For example, if `x = list(c("A"), c("B", "C"))`, then the resulting frame will have a target encoding column for A and a target encoding column for B & C (in this case, we group by two columns).

- **y**
  The name or column index of the response variable in the data. The response variable can be either numeric or binary.

- **target_encode_map**
  A list of H2OFrame objects that is the results of the `h2o.target_encode_create` function.

- **holdout_type**
  The holdout type used. Must be one of: "LeaveOneOut", "KFold", "None".

- **fold_column**
  (Optional) The name or column index of the fold column in the data. Defaults to NULL (no 'fold_column'). Only required if 'holdout_type' = "KFold".

- **blended_avg**
  Logical. (Optional) Whether to perform blended average.

- **noise_level**
  (Optional) The amount of random noise added to the target encoding. This helps prevent overfitting. Defaults to 0.01 * range of y.

- **seed**
  (Optional) A random seed used to generate draws from the uniform distribution for random noise. Defaults to -1.

Value

Returns an H2OFrame object containing the target encoding per record.

See Also

- `h2o.target_encode_create` for creating the target encoding map

Examples

```r
## Not run:
library(h2o)
h2o.init()

# Get Target Encoding Frame on bank-additional-full data with numeric `y`
data <- h2o.importFile(
  path = "https://s3.amazonaws.com/h2o-public-test-data/smalldata/demos/bank-additional-full.csv")
```
splits <- h2o.splitFrame(data, seed = 1234)
train <- splits[[1]]
test <- splits[[2]]
mapping <- h2o.target_encode_create(data = train, x = list(c("job"), c("job", "marital")),
  y = "age")

# Apply mapping to the training dataset
train_encode <- h2o.target_encode_apply(data = train, x = list(c("job"), c("job", "marital")),
  y = "age", mapping, holdout_type = "LeaveOneOut")

# Apply mapping to a test dataset
test_encode <- h2o.target_encode_apply(data = test, x = list(c("job"), c("job", "marital")),
  y = "age", target_encode_map = mapping,
  holdout_type = "None")

## End(Not run)

h2o.target_encode_create

Create Target Encoding Map

Description

Creates a target encoding map based on group-by columns ('x') and a numeric or binary target column ('y'). Computing target encoding for high cardinality categorical columns can improve performance of supervised learning models. A Target Encoding tutorial is available here: https://github.com/h2oai/h2o-tutorials/blob/master/best-practices/categorical-predictors/target_encoding.md.

Usage

h2o.target_encode_create(data, x, y, fold_column = NULL)

Arguments

data An H2OFrame object with which to create the target encoding map.
x A list containing the names or indices of the variables to encode. A target encoding map will be created for each element in the list. Items in the list can be multiple columns. For example, if `x = list(c("A"), c("B", "C")`, then there will be one mapping frame for A and one mapping frame for B & C (in this case, we group by two columns).
y The name or column index of the response variable in the data. The response variable can be either numeric or binary.
fold_column (Optional) The name or column index of the fold column in the data. Defaults to NULL (no `fold_column`).

Value

Returns a list of H2OFrame objects containing the target encoding mapping for each column in ‘x’. 
h2o.tf_idf

Computes TF-IDF values for each word in given documents.

Description

Computes TF-IDF values for each word in given documents.

Usage

h2o.tf_idf(
  frame, 
  document_id_col, 
  text_col, 
  preprocess = TRUE, 
  case_sensitive = TRUE 
)

Arguments

frame documents or words frame for which TF-IDF values should be computed.
document_id_col index or name of a column containing document IDs.
text_col index or name of a column containing documents if `preprocess = TRUE` or words if `preprocess = FALSE`.
Preprocess whether input text data should be pre-processed. Defaults to ‘TRUE’.

Case sensitive whether input data should be treated as case sensitive. Defaults to ‘TRUE’.

**Value**

Resulting frame with TF-IDF values. Row format: documentID, word, TF, IDF, TF-IDF

---

### h2o.toFrame

**Convert a word2vec model into an H2OFrame**

**Description**

Converts a given word2vec model into an H2OFrame. The frame represents learned word embeddings.

**Usage**

```r
h2o.toFrame(word2vec)
```

**Arguments**

- `word2vec` A word2vec model.

**Examples**

```r
# Not run:
h2o.init()

# Build a dummy word2vec model
data <- as.character(as.h2o(c("a", "b", "a")))
w2v_model <- h2o.word2vec(data, sent_sample_rate = 0, min_word_freq = 0, epochs = 1, vec_size = 2)

# Transform words to vectors and return average vector for each sentence
h2o.toFrame(w2v_model) # -> Frame made of 2 rows and 2 columns

# End(Not run)
```
h2o.tokenize

### Description

h2o.tokenize is similar to h2o.strsplit, the difference between them is that h2o.tokenize will store the tokenized text into a single column making it easier for additional processing (filtering stop words, word2vec algo, ...).

### Usage

```r
h2o.tokenize(x, split)
```

#### Arguments

- `x`: The column or columns whose strings to tokenize.
- `split`: The regular expression to split on.

#### Value

An H2OFrame with a single column representing the tokenized Strings. Original rows of the input DF are separated by NA.

### Examples

```r
## Not run:
library(h2o)
h2o.init()
string_to_tokenize <- as.h2o("Split at every character and tokenize.")
tokenize_string <- h2o.tokenize(as.character(string_to_tokenize), \\
""
## End(Not run)
```

---

h2o.tolower

### Description

Convert strings to lowercase

### Usage

```r
h2o.tolower(x)
```

#### Arguments

- `x`: An H2OFrame object whose strings should be lower cased
Value

An H2OFrame with all entries in lowercase format

Examples

```r
## Not run:
library(h2o)
h2o.init()
string_to_lower <- as.h2o("ABCDE")
lowered_string <- h2o.tolower(string_to_lower)

## End(Not run)
```

---

**H2O topN**

Description

Extract the top N percent of values of a column and return it in a H2OFrame.

Usage

```r
h2o.topN(x, column, nPercent)
```

Arguments

- `x`: an H2OFrame
- `column`: is a column name or column index to grab the top N percent value from
- `nPercent`: is a top percentage value to grab

Value

An H2OFrame with 2 columns. The first column is the original row indices, second column contains the topN values

Examples

```r
## Not run:
library(h2o)
h2o.init()

dataset <- h2o.importFile(f)
frameNames <- names(dataset)
nPercent <- c(1, 2, 3, 4)
nP <- nPercent[sample(1:length(nPercent), 1, replace = FALSE)]
colIndex <- sample(1:length(frameNames), 1, replace = FALSE)
h2o.topN(dataset, frameNames[colIndex], nP)

## End(Not run)
```
h2o.totss

Get the total sum of squares.

Description

If "train", "valid", and "xval" parameters are FALSE (default), then the training totss value is returned. If more than one parameter is set to TRUE, then a named vector of totss’ are returned, where the names are "train", "valid" or "xval".

Usage

h2o.totss(object, train = FALSE, valid = FALSE, xval = FALSE)

Arguments

- **object**: An H2OClusteringModel object.
- **train**: Retrieve the training total sum of squares
- **valid**: Retrieve the validation total sum of squares
- **xval**: Retrieve the cross-validation total sum of squares

Examples

```r
## Not run:
library(h2o)
h2o.init()
predictors <- c("sepal_len", "sepal_wid", "petal_len", "petal_wid")
km <- h2o.kmeans(x = predictors, training_frame = fr, k = 3, nfolds = 3)
h2o.totss(km, train = TRUE)
## End(Not run)
```

h2o.tot_withinss

Get the total within cluster sum of squares.

Description

If "train", "valid", and "xval" parameters are FALSE (default), then the training tot_withinss value is returned. If more than one parameter is set to TRUE, then a named vector of tot_withinss’ are returned, where the names are "train", "valid" or "xval".

Usage

h2o.tot_withinss(object, train = FALSE, valid = FALSE, xval = FALSE)
h2o.toupper 339

Arguments

object An H2OClusteringModel object.
train Retrieve the training total within cluster sum of squares
valid Retrieve the validation total within cluster sum of squares
xval Retrieve the cross-validation total within cluster sum of squares

Examples

## Not run:
library(h2o)
h2o.init()

predictors <- c("sepal_len", "sepal_wid", "petal_len", "petal_wid")
km <- h2o.kmeans(x = predictors, training_frame = fr, k = 3, nfolds = 3)
h2o.tot_withinss(km, train = TRUE)

## End(Not run)

h2o.toupper Convert strings to uppercase

Description

Convert strings to uppercase

Usage

h2o.toupper(x)

Arguments

x An H2OFrame object whose strings should be upper cased

Value

An H2OFrame with all entries in uppercase format

Examples

## Not run:
library(h2o)
h2o.init()

string_to_upper <- as.h2o("abcde")
upper_string <- h2o.toupper(string_to_upper)

## End(Not run)
**h2o.train_segments**

**H2O Segmented-Data Bulk Model Training**

**Description**

Provides a set of functions to train a group of models on different segments (subpopulations) of the training set.

**Usage**

```r
h2o.train_segments(
  algorithm,
  segment_columns,
  segment_models_id,
  parallelism = 1,
  ...
)
```

**Arguments**

- **algorithm**
  
  Name of algorithm to use in training segment models (gbm, randomForest, kmeans, glm, deeplearning, naivebayes, psvm, xgboost, pca, svd, targetencoder, aggregator, word2vec, coxph, isolationforest, kmeans, stackedensemble, glm, gam).

- **segment_columns**
  
  A list of columns to segment-by. H2O will group the training (and validation) dataset by the segment-by columns and train a separate model for each segment (group of rows).

- **segment_models_id**
  
  Identifier for the returned collection of Segment Models. If not specified it will be automatically generated.

- **parallelism**
  
  Level of parallelism of bulk model building, it is the maximum number of models each H2O node will be building in parallel, defaults to 1.

- **...**
  
  Use to pass along training_frame parameter, x, y, and all non-default parameter values to the algorithm. Look at the specific algorithm - h2o.gbm, h2o.glm, h2o.kmeans, h2o.deepLearning - for available parameters.

**Details**

Start Segmented-Data bulk Model Training for a given algorithm and parameters.

**Examples**

```r
# Not run:
library(h2o)
h2o.init()
iris_hf <- as.h2o(iris)
```
```r
models <- h2o.train_segments(algorithm = "gbm",
                           segment_columns = "Species",
                           x = c(1:3), y = 4,
                           training_frame = iris_hf,
                           ntrees = 5,
                           max_depth = 4)
as.data.frame(models)

## End(Not run)
```

**h2o.transform**

Use H2O Transformation model and apply the underlying transformation

**Description**

Use H2O Transformation model and apply the underlying transformation

**Usage**

```r
h2o.transform(model, ...)
```

**Arguments**

- **model**: A trained model representing the transformation strategy
- **...**: Transformation model-specific parameters

**Value**

Returns an H2OFrame object with data transformed.

**Description**

Applies target encoding to a given dataset
Usage

```r
h2o.transform(model,
data,
blending = NULL,
ineflection_point = -1,
smoothing = -1,
noise = NULL,
as_training = FALSE,
...)
```

Arguments

- `model`: A trained model representing the transformation strategy.
- `data`: An H2OFrame with data to be transformed.
- `blending`: Use blending during the transformation. Respects model settings when not set.
- `inflection_point`: Blending parameter. Only effective when blending is enabled. By default, model settings are respected, if not overridden by this setting.
- `smoothing`: Blending parameter. Only effective when blending is enabled. By default, model settings are respected, if not overridden by this setting.
- `noise`: An amount of random noise added to the encoding, this helps prevent overfitting. By default, model settings are respected, if not overridden by this setting.
- `as_training`: Must be set to True when encoding the training frame. Defaults to False.
- `...`: Mainly used for backwards compatibility, to allow deprecated parameters.

Value

Returns an H2OFrame object with data transformed.

Transform words (or sequences of words) to vectors using a word2vec model.

Description

Transform words (or sequences of words) to vectors using a word2vec model.

Usage

```r
h2o.transform(model, words, aggregate_method = c("NONE", "AVERAGE"))
```
h2o.transform_word2vec

Transform words (or sequences of words) to vectors using a word2vec model.

Arguments

- **model**: A word2vec model.
- **words**: An H2OFrame made of a single column containing source words.
- **aggregate_method**: Specifies how to aggregate sequences of words. If method is ‘NONE’ then no aggregation is performed and each input word is mapped to a single word-vector. If method is ‘AVERAGE’ then input is treated as sequences of words delimited by NA. Each word of a sequences is internally mapped to a vector and vectors belonging to the same sentence are averaged and returned in the result.

Examples

```r
### Not run:
h2o.init()

# Build a simple word2vec model
data <- as.character(as.h2o(c("a", "b", "a")))
w2v_model <- h2o.word2vec(data, sent_sample_rate = 0, min_word_freq = 0, epochs = 1, vec_size = 2)

# Transform words to vectors without aggregation
sentences <- as.character(as.h2o(c("b", "c", "a", NA, "b")))
h2o.transform(w2v_model, sentences) # -> 5 rows total, 2 rows NA ("c" is not in the vocabulary)

# Transform words to vectors and return average vector for each sentence
h2o.transform(w2v_model, sentences, aggregate_method = "AVERAGE") # -> 2 rows

### End(Not run)
```
Arguments

word2vec A word2vec model.
words An H2OFrame made of a single column containing source words.
aggregate_method Specifies how to aggregate sequences of words. If method is ‘NONE’ then no aggregation is performed and each input word is mapped to a single word-vector. If method is ‘AVERAGE’ then input is treated as sequences of words delimited by NA. Each word of a sequences is internally mapped to a vector and vectors belonging to the same sentence are averaged and returned in the result.

Examples

```r
## Not run:
h2o.init()

# Build a dummy word2vec model
data <- as.character(as.h2o(c("a", "b", "a")))
w2v_model <- h2o.word2vec(data, sent_sample_rate = 0, min_word_freq = 0, epochs = 1, vec_size = 2)

# Transform words to vectors without aggregation
sentences <- as.character(as.h2o(c("b", "c", "a", NA, "b")))
h2o.transform(w2v_model, sentences) # -> 5 rows total, 2 rows NA ("c" is not in the vocabulary)

# Transform words to vectors and return average vector for each sentence
h2o.transform(w2v_model, sentences, aggregate_method = "AVERAGE") # -> 2 rows

## End(Not run)
```

---

**h2o.trim**

**Trim Space**

Description

Trim Space

Usage

```r
h2o.trim(x)
```

Arguments

x The column whose strings should be trimmed.
Examples

```r
## Not run:
library(h2o)
h2o.init()
string_to_trim <- as.h2o("r tutorial")
trim_string <- h2o.trim(string_to_trim)
## End(Not run)
```

### h2o.trunc

**Truncate values in x toward 0**

**Description**

trunc takes a single numeric argument x and returns a numeric vector containing the integers formed by truncating the values in x toward 0.

**Usage**

```r
h2o.trunc(x)
```

**Arguments**

- **x**
  
  An H2OFrame object.

**See Also**

`Round` for the base R implementation, `trunc()`.

**Examples**

```r
## Not run:
library(h2o)
h2o.init()

frame <- h2o.createFrame(rows = 6, cols = 2,
categorical_fraction = 0.0,
missing_fraction = 0.7,
seed = 123)

h2o.trunc(frame["C1"])
## End(Not run)
```
h2o.unique | $H2O$ Unique

**Description**

Extract unique values in the column.

**Usage**

```
  h2o.unique(x, include_nas = FALSE)
```

**Arguments**

- `x`  
  An H2OFrame object.
- `include_nas`  
  If set to TRUE, NAs are included. FALSE (turned off) by default.

**Value**

Returns an H2OFrame object.

**Examples**

```
## Not run:
library(h2o)
h2o.init()

iris <- h2o.importFile(f)
h2o.unique(iris["class"])
## End(Not run)
```

h2o.upload_model

**Description**

Upload a binary model from the provided local path to the H2O cluster. (H2O model can be saved in a binary form either by saveModel() or by download_model() function.)

**Usage**

```
  h2o.upload_model(path)
```
**h2o.upload_mojo**

**Imports a MOJO from a local filesystem, creating a Generic model with it.**

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>path</td>
<td>A path on the machine this python session is currently connected to, specifying the location of the model to upload.</td>
</tr>
</tbody>
</table>

**Value**

Returns a new **H2OModel** object.

**See Also**

h2o.saveModel, h2o.download_model

---

**Description**

Usage example: 

```
mojo_model <- h2o.upload_mojo(model_file_path = "/path/to/local/mojo.zip")
predictions <- h2o.predict(mojo_model, dataset)
```

**Usage**

```
h2o.upload_mojo(mojo_local_file_path)
```

**Arguments**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mojo_local_file_path</td>
<td>Filesystem path to the model imported</td>
</tr>
</tbody>
</table>

**Value**

Returns H2O Generic Model embedding given MOJO model

**Examples**

```
## Not run:

# Import default Iris dataset as H2O frame
data <- as.h2o(iris)

# Train a very simple GBM model
original_model <- h2o.gbm(x = features, y = "Species", training_frame = data)

# Download the trained GBM model as MOJO (temporary directory used in this example)
mojo_original_name <- h2o.download_mojo(model = original_model, path = tempdir())
mojo_original_path <- paste0(tempdir(), "/", mojo_original_name)
```
# Upload the MOJO from local filesystem and obtain a Generic model
mojo_model <- h2o.upload_mojo(mojo_original_path)

# Perform scoring with the generic model
predictions <- h2o.predict(mojo_model, data)

## End(Not run)

---

**h2o.var**  
**Variance of a column or covariance of columns.**

**Description**

Compute the variance or covariance matrix of one or two H2OFrames.

**Usage**

```r
h2o.var(x, y = NULL, na.rm = FALSE, use)

var(x, y = NULL, na.rm = FALSE, use)
```

**Arguments**

- `x`  
  An H2OFrame object.

- `y`  
  NULL (default) or an H2OFrame. The default is equivalent to `y = x`.

- `na.rm`  
  logical. Should missing values be removed?

- `use`  
  An optional character string indicating how to handle missing values. This must be one of the following: "everything" - outputs NaNs whenever one of its contributing observations is missing "all.obs" - presence of missing observations will throw an error "complete.obs" - discards missing values along with all observations in their rows so that only complete observations are used

**See Also**

- `cor` for the base R implementation, `var()`.
- `h2o.sd` for standard deviation.

**Examples**

```r
## Not run:
library(h2o)
h2o.init()

prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
var(prostate$AGE)

## End(Not run)
```
**h2o.varimp**

Retrieve the variable importance.

---

**Description**

Retrieve the variable importance.

**Usage**

```r
h2o.varimp(object)
```

**Arguments**

- `object` - An H2OModel object.

**Examples**

```r
## Not run:
library(h2o)
h2o.init()
f <- "https://s3.amazonaws.com/h2o-public-test-data/smalldata/prostate/prostate_complete.csv.zip"
pros <- h2o.importFile(f)
response <- "GLEASON"
predictors <- c("ID", "AGE", "CAPSULE", "DCAPS", "PSA", "VOL", "DPROS")
model <- h2o.glm(x = predictors, y = response, training_frame = pros)
h2o.varimp(model)
## End(Not run)
```

---

**h2o.varimp_heatmap**

Variable Importance Heatmap across multiple models

---

**Description**

Variable importance heatmap shows variable importance across multiple models. Some models in H2O return variable importance for one-hot (binary indicator) encoded versions of categorical columns (e.g. Deep Learning, XGBoost). In order for the variable importance of categorical columns to be compared across all model types we compute a summarization of the the variable importance across all one-hot encoded features and return a single variable importance for the original categorical feature. By default, the models and variables are ordered by their similarity.

**Usage**

```r
h2o.varimp_heatmap(object, top_n = 20)
```
**Arguments**

- **object**
  An H2OAutoML object or list of H2O models.

- **top_n**
  Integer specifying the number models shown in the heatmap (based on leaderboard ranking). Defaults to 20.

**Value**

A ggplot2 object.

**Examples**

```r
## Not run:
library(h2o)
h2o.init()

# Import the wine dataset into H2O:
df <- h2o.importFile(f)

# Set the response
response <- "quality"

# Split the dataset into a train and test set:
splits <- h2o.splitFrame(df, ratios = 0.8, seed = 1)
train <- splits[[1]]
test <- splits[[2]]

# Build and train the model:
aml <- h2o.automl(y = response,
                 training_frame = train,
                 max_models = 10,
                 seed = 1)

# Create the variable importance heatmap
varimp_heatmap <- h2o.varimp_heatmap(aml)
print(varimp_heatmap)

## End(Not run)
```

---

**h2o.varimp_plot**  
*Plot Variable Importances*

**Description**

Plot Variable Importances

**Usage**

h2o.varimp_plot(model, num_of_features = NULL)
Arguments

model A trained model (accepts a trained random forest, GBM, or deep learning model, will use h2o.std_coef_plot for a trained GLM

num_of_features The number of features shown in the plot (default is 10 or all if less than 10).

See Also

h2o.std_coef_plot for GLM.

Examples

```r
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.importFile(prostate_path)
prostate[, 2] <- as.factor(prostate[, 2])
model <- h2o.gbm(x = 3:9, y = 2, training_frame = prostate, distribution = "bernoulli")
h2o.varimp_plot(model)

# for deep learning set the variable_importance parameter to TRUE
iris_hf <- as.h2o(iris)
iris_dl <- h2o.deeplearning(x = 1:4, y = 5, training_frame = iris_hf,
variable_importances = TRUE)
h2o.varimp_plot(iris_dl)
## End(Not run)
```

Description

Retrieve per-variable split information for a given Isolation Forest model. Output will include:
- count - The number of times a variable was used to make a split.
- aggregated_split_ratios - The split ratio is defined as \( \frac{\text{abs(#left_observations - #right_observations)}}{\text{before_split}} \). Even splits (#left_observations approx the same as #right_observations) contribute less to the total aggregated split ratio value for the given feature; highly imbalanced splits (e.g. #left_observations » #right_observations) contribute more.
- aggregated_split_depths - The sum of all depths of a variable used to make a split. (If a variable is used on level N of a tree, then it contributes with N to the total aggregate.)
splits (#left_observations approx the same as #right_observations) contribute less to the total aggregated split ratio value for the given feature; highly imbalanced splits (eg. #left_observations » #right_observations) contribute more. - aggregated_split_depths - The sum of all depths of a variable used to make a split. (If a variable is used on level N of a tree, then it contributes with N to the total aggregate.)

Usage

h2o.varsplits(object)

Arguments

object

An Isolation Forest model represented by H2OModel object.

h2o.week

Convert Milliseconds to Week of Week Year in H2O Datasets

Description

Converts the entries of an H2OFrame object from milliseconds to weeks of the week year (starting from 1).

Usage

h2o.week(x)

week(x)

## S3 method for class 'H2OFrame'

week(x)

Arguments

x

An H2OFrame object.

Value

An H2OFrame object containing the entries of x converted to weeks of the week year.

See Also

h2o.month
h2o.weights

Examples

```
## Not run:
library(h2o)
h2o.init()

hdf <- h2o.importFile(f)
h2o.week(hdf["ds9"])

## End(Not run)
```

---

h2o.weights

Retrieve the respective weight matrix

Description

Retrieve the respective weight matrix

Usage

```
h2o.weights(object, matrix_id = 1)
```

Arguments

- `object`: An H2OModel or H2OModelMetrics
- `matrix_id`: An integer, ranging from 1 to number of layers + 1, that specifies the weight matrix to return.

Examples

```
## Not run:
library(h2o)
h2o.init()

census <- h2o.importFile(f)
census[, 1] <- as.factor(census[, 1])
dl_model <- h2o.deeplearning(x = c(1:3), y = 4, training_frame = census,
                             hidden = c(17, 191),
                             epochs = 1,
                             balance_classes = FALSE,
                             export_weights_and_biases = TRUE)
h2o.weights(dl_model, matrix_id = 1)

## End(Not run)
```
h2o.which

Which indices are TRUE?

Description
Give the TRUE indices of a logical object, allowing for array indices.

Usage
h2o.which(x)

Arguments
x
An H2OFrame object.

Value
Returns an H2OFrame object.

See Also
which for the base R method.

Examples
## Not run:
library(h2o)
h2o.init()

iris_hf <- as.h2o(iris)
h2o.which(iris_hf[, 1] == 4.4)
## End(Not run)

h2o.which_max

Which indice contains the max value?

Description
Get the index of the max value in a column or row

Usage
h2o.which_max(x, na.rm = TRUE, axis = 0)

which.max.H2OFrame(x, na.rm = TRUE, axis = 0)
which.min.H2OFrame(x, na.rm = TRUE, axis = 0)
### h2o.which_min

**Arguments**

- `x`: An H2OFrame object.
- `na.rm`: logical. Indicate whether missing values should be removed.
- `axis`: integer. Indicate whether to calculate the mean down a column (0) or across a row (1).

**Value**

Returns an H2OFrame object.

**See Also**

- `which.min` for the base R method, `which.max()`.

**Examples**

```r
## Not run:
library(h2o)
h2o.init()

census <- h2o.importFile(f)
census[, 1] <- as.factor(census[, 1])
dl_model <- h2o.deeplearning(x = c(1:3), y = 4, hidden = c(17, 191),
                              epochs = 1, training_frame = census,
                              balance_classes = FALSE,
                              export_weights_and_biases = TRUE)
h2o.which_max(census["PER CAPITA INCOME "], na.rm = FALSE, axis = 0)

## End(Not run)
```

---

### Description

Get the index of the min value in a column or row

### Usage

```
h2o.which_min(x, na.rm = TRUE, axis = 0)
```

### Arguments

- `x`: An H2OFrame object.
- `na.rm`: logical. Indicate whether missing values should be removed.
- `axis`: integer. Indicate whether to calculate the mean down a column (0) or across a row (1).
h2o.withinss

Get the Within SS

Description

Get the Within SS

Usage

h2o.withinss(object)

Arguments

object An H2OClusteringModel object.
h2o.word2vec

Trains a word2vec model on a String column of an H2O data frame

Description

Trains a word2vec model on a String column of an H2O data frame

Usage

h2o.word2vec(
    training_frame = NULL,
    model_id = NULL,
    min_word_freq = 5,
    word_model = c("SkipGram", "CBOW"),
    norm_model = c("HSM"),
    vec_size = 100,
    window_size = 5,
    sent_sample_rate = 0.001,
    init_learning_rate = 0.025,
    epochs = 5,
    pre_trained = NULL,
    max_runtime_secs = 0,
    export_checkpoints_dir = NULL
)

Arguments

training_frame  Id of the training data frame.
model_id        Destination id for this model; auto-generated if not specified.
min_word_freq   This will discard words that appear less than <int> times Defaults to 5.
word_model      The word model to use (SkipGram or CBOW) Must be one of: "SkipGram", "CBOW". Defaults to SkipGram.
norm_model      Use Hierarchical Softmax Must be one of: "HSM". Defaults to HSM.
vec_size        Set size of word vectors Defaults to 100.
window_size     Set max skip length between words Defaults to 5.
sent_sample_rate Set threshold for occurrence of words. Those that appear with higher frequency in the training data will be randomly down-sampled; useful range is (0, 1e-5) Defaults to 0.001.
init_learning_rate Set the starting learning rate Defaults to 0.025.
epochs          Number of training iterations to run Defaults to 5.
pre_trained     Id of a data frame that contains a pre-trained (external) word2vec model
max_runtime_secs
   Maximum allowed runtime in seconds for model training. Use 0 to disable.
   Defaults to 0.
export_checkpoints_dir
   Automatically export generated models to this directory.

Examples

```r
## Not run:
library(h2o)
h2o.init()

# Import the CraigslistJobTitles dataset
job_titles <- h2o.importFile(
   col.names = c("category", "jobtitle"), col.types = c("String", "String"), header = TRUE )

# Build and train the Word2Vec model
words <- h2o.tokenize(job_titles, " ")
vec <- h2o.word2vec(training_frame = words)
h2o.findSynonyms(vec, "teacher", count = 20)
```

---

h2o.xgboost  
Build an eXtreme Gradient Boosting model

Description

Builds an eXtreme Gradient Boosting model using the native XGBoost backend.

Usage

```r
h2o.xgboost(
  x,  
  y,  
  training_frame,  
  model_id = NULL,  
  validation_frame = NULL,  
  nfolds = 0,  
  keep_cross_validation_models = TRUE,
  keep_cross_validation_predictions = FALSE,  
  keep_cross_validation_fold_assignment = FALSE,  
  score_each_iteration = FALSE,  
  fold_assignment = c("AUTO", "Random", "Modulo", "Stratified"),  
  fold_column = NULL,  
  ignore_const_cols = TRUE,  
  offset_column = NULL,
```
weights_column = NULL,
stopping_rounds = 0,
stopping_metric = c("AUTO", "deviance", "logloss", "MSE", "RMSE", "MAE", "RMSLE", "AUC", "AUCPR", "lift_top_group", "misclassification", "mean_per_class_error", "custom", "custom_increasing"),

save_matrix_directory = NULL,
build_tree_one_node = FALSE,
calibrate_model = FALSE,
calibration_frame = NULL,
max_bins = 256,
max_leaves = 0,
sample_type = c("uniform", "weighted"),
normalize_type = c("tree", "forest"),
rate_drop = 0,
one_drop = FALSE,
skip_drop = 0,
tree_method = c("auto", "exact", "approx", "hist"),
grow_policy = c("depthwise", "lossguide"),
booster = c("gbtree", "gblinear", "dart"),
reg_lambda = 1,
reg_alpha = 0,
dmatrix_type = c("auto", "dense", "sparse"),
backend = c("auto", "gpu", "cpu"),
gpu_id = NULL,
gainslift_bins = -1,
verbose = FALSE )

Arguments

x  (Optional) A vector containing the names or indices of the predictor variables to use in building the model. If x is missing, then all columns except y are used.
y  The name or column index of the response variable in the data. The response must be either a numeric or a categorical/factor variable. If the response is numeric, then a regression model will be trained, otherwise it will train a classification model.
training_frame  Id of the training data frame.
model_id  Destination id for this model; auto-generated if not specified.
validation_frame  Id of the validation data frame.
nfolds  Number of folds for K-fold cross-validation (0 to disable or >= 2). Defaults to 0.
keep_cross_validation_models  Logical. Whether to keep the cross-validation models. Defaults to TRUE.
keep_cross_validation_predictions  Logical. Whether to keep the predictions of the cross-validation models. Defaults to FALSE.
keep_cross_validation_fold_assignment  Logical. Whether to keep the cross-validation fold assignment. Defaults to FALSE.
score_each_iteration  Logical. Whether to score during each iteration of model training. Defaults to FALSE.
fold_assignment  Cross-validation fold assignment scheme, if fold_column is not specified. The 'Stratified' option will stratify the folds based on the response variable, for classification problems. Must be one of: "AUTO", "Random", "Modulo", "Stratified". Defaults to AUTO.
fold_column  Column with cross-validation fold index assignment per observation.
ignore_const_cols  Logical. Ignore constant columns. Defaults to TRUE.
offset_column  Offset column. This will be added to the combination of columns before applying the link function.

weights_column  Column with observation weights. Giving some observation a weight of zero is equivalent to excluding it from the dataset; giving an observation a relative weight of 2 is equivalent to repeating that row twice. Negative weights are not allowed. Note: Weights are per-row observation weights and do not increase the size of the data frame. This is typically the number of times a row is repeated, but non-integer values are supported as well. During training, rows with higher weights matter more, due to the larger loss function pre-factor.

stopping_rounds  Early stopping based on convergence of stopping_metric. Stop if simple moving average of length k of the stopping_metric does not improve for k:=stopping_rounds scoring events (0 to disable) Defaults to 0.

stopping_metric  Metric to use for early stopping (AUTO: logloss for classification, deviance for regression and anomaly_score for Isolation Forest). Note that custom and custom_increasing can only be used in GBM and DRF with the Python client. Must be one of: "AUTO", "deviance", "logloss", "MSE", "RMSE", "MAE", "RMSLE", "AUC", "AUCPR", "lift_top_group", "misclassification", "mean_per_class_error", "custom", "custom_increasing". Defaults to AUTO.

stopping_tolerance  Relative tolerance for metric-based stopping criterion (stop if relative improvement is not at least this much) Defaults to 0.001.

max_runtime_secs  Maximum allowed runtime in seconds for model training. Use 0 to disable. Defaults to 0.

seed  Seed for random numbers (affects certain parts of the algo that are stochastic and those might or might not be enabled by default). Defaults to -1 (time-based random number).

distribution  Distribution function Must be one of: "AUTO", "bernoulli", "multinomial", "gaussian", "poisson", "gamma", "tweedie", "laplace", "quantile", "huber". Defaults to AUTO.

tweedie_power  Tweedie power for Tweedie regression, must be between 1 and 2. Defaults to 1.5.

categorical_encoding  Encoding scheme for categorical features Must be one of: "AUTO", "Enum", "OneHotInternal", "OneHotExplicit", "Binary", "Eigen", "LabelEncoder", "SortByResponse", "EnumLimited". Defaults to AUTO.

quiet_mode  Logical. Enable quiet mode Defaults to TRUE.

checkpoint  Model checkpoint to resume training with.

export_checkpoints_dir  Automatically export generated models to this directory.

ntrees  (same as n_estimators) Number of trees. Defaults to 50.

max_depth  Maximum tree depth (0 for unlimited). Defaults to 6.
min_rows
  (same as min_child_weight) Fewest allowed (weighted) observations in a leaf. Defaults to 1.

min_child_weight
  (same as min_rows) Fewest allowed (weighted) observations in a leaf. Defaults to 1.

learn_rate
  (same as eta) Learning rate (from 0.0 to 1.0) Defaults to 0.3.

eta
  (same as learn_rate) Learning rate (from 0.0 to 1.0) Defaults to 0.3.

sample_rate
  (same as subsample) Row sample rate per tree (from 0.0 to 1.0) Defaults to 1.

subsample
  (same as sample_rate) Row sample rate per tree (from 0.0 to 1.0) Defaults to 1.

col_sample_rate
  (same as colsample_bylevel) Column sample rate (from 0.0 to 1.0) Defaults to 1.

colsample_bylevel
  (same as col_sample_rate) Column sample rate (from 0.0 to 1.0) Defaults to 1.

col_sample_rate_per_tree
  (same as colsample_bytree) Column sample rate per tree (from 0.0 to 1.0) Defaults to 1.

colsample_bytree
  (same as col_sample_rate_per_tree) Column sample rate per tree (from 0.0 to 1.0) Defaults to 1.

colsample_bynode
  Column sample rate per tree node (from 0.0 to 1.0) Defaults to 1.

max_abs_leafnode_pred
  (same as max_delta_step) Maximum absolute value of a leaf node prediction Defaults to 0.0.

max_delta_step
  (same as max_abs_leafnode_pred) Maximum absolute value of a leaf node prediction Defaults to 0.0.

monotone_constraints
  A mapping representing monotonic constraints. Use +1 to enforce an increasing constraint and -1 to specify a decreasing constraint.

interaction_constraints
  A set of allowed column interactions.

score_tree_interval
  Score the model after every so many trees. Disabled if set to 0. Defaults to 0.

min_split_improvement
  (same as gamma) Minimum relative improvement in squared error reduction for a split to happen Defaults to 0.0.

gamma
  (same as min_split_improvement) Minimum relative improvement in squared error reduction for a split to happen Defaults to 0.0.

auc_type
  Set default multinomial AUC type. Must be one of: "AUTO", "NONE", "MACRO_OVR", "WEIGHTED_OVR", "MACRO_OVO", "WEIGHTED_OVO". Defaults to AUTO.

nthread
  Number of parallel threads that can be used to run XGBoost. Cannot exceed H2O cluster limits (-nthreads parameter). Defaults to maximum available Defaults to -1.
save_matrix_directory
Directory where to save matrices passed to XGBoost library. Useful for debugging.

build_tree_one_node
Logical. Run on one node only; no network overhead but fewer cpus used. Suitable for small datasets. Defaults to FALSE.

calibrate_model
Logical. Use Platt Scaling to calculate calibrated class probabilities. Calibration can provide more accurate estimates of class probabilities. Defaults to FALSE.

calibration_frame
Calibration frame for Platt Scaling

max_bins
For tree_method=hist only: maximum number of bins Defaults to 256.

max_leaves
For tree_method=hist only: maximum number of leaves Defaults to 0.

sample_type
For booster=dart only: sample_type Must be one of: "uniform", "weighted". Defaults to uniform.

normalize_type
For booster=dart only: normalize_type Must be one of: "tree", "forest". Defaults to tree.

rate_drop
For booster=dart only: rate_drop (0..1) Defaults to 0.0.

one_drop
Logical. For booster=dart only: one_drop Defaults to FALSE.

skip_drop
For booster=dart only: skip_drop (0..1) Defaults to 0.0.

tree_method
Tree method Must be one of: "auto", "exact", "approx", "hist". Defaults to auto.

grow_policy
Grow policy - depthwise is standard GBM, lossguide is LightGBM Must be one of: "depthwise", "lossguide". Defaults to depthwise.

booster
Booster type Must be one of: "gbtree", "gblinear", "dart". Defaults to gbtree.

reg_lambda
L2 regularization Defaults to 1.0.

reg_alpha
L1 regularization Defaults to 0.0.

dmatrix_type
Type of DMatrix. For sparse, NAs and 0 are treated equally. Must be one of: "auto", "dense", "sparse". Defaults to auto.

backend
Backend. By default (auto), a GPU is used if available. Must be one of: "auto", "gpu", "cpu". Defaults to auto.

gpu_id
Which GPU(s) to use.

gainslift_bins
Gains/Lift table number of bins. 0 means disabled.. Default value -1 means automatic binning. Defaults to -1.

verbose
Logical. Print scoring history to the console (Metrics per tree). Defaults to FALSE.

Examples

## Not run:
library(h2o)
h2o.init()

# Import the titanic dataset
f <- "https://s3.amazonaws.com/h2o-public-test-data/smalldata/gbm_test/titanic.csv"
titanic <- h2o.importFile(f)

# Set predictors and response; set response as a factor
titanic["survived"] <- as.factor(titanic["survived"])  
predictors <- setdiff(colnames(titanic), colnames(titanic)[2:3])
response <- "survived"

# Split the dataset into train and valid
splits <- h2o.splitFrame(data = titanic, ratios = .8, seed = 1234)
train <- splits[[1]]
valid <- splits[[2]]

# Train the XGB model
xgb <- h2o.xgboost(x = predictors, y = response,
                   training_frame = train, validation_frame = valid,
                   booster = "dart", normalize_type = "tree",
                   seed = 1234)

## End(Not run)

---

### `h2o.xgboost.available`

**Determine whether an XGBoost model can be built**

#### Description

Ask the H2O server whether a XGBoost model can be built. (Depends on availability of native backend.) Returns True if a XGBoost model can be built, or False otherwise.

#### Usage

```r
h2o.xgboost.available()
```

---

### `h2o.year`

**Convert Milliseconds to Years in H2O Datasets**

#### Description

Convert the entries of an H2OFrame object from milliseconds to years, indexed starting from 1900.

#### Usage

```r
h2o.year(x)  
year(x)
```

## S3 method for class 'H2OFrame'

```r
year(x)
```
Arguments

x  An H2OFrame object.

Details
This method calls the function of the MutableDateTime class in Java.

Value
An H2OFrame object containing the entries of x converted to years

See Also
h2o.month

Examples
```r
## Not run:
library(h2o)
h2o.init()

hdf <- h2o.importFile(f)
h2o.year(hdf["ds9"])

## End(Not run)
```
Slots

model_id A character string specifying the key for the model fit in the H2O cluster's key-value store.

algorithm A character string specifying the algorithm that was used to fit the model.

parameters A list containing the parameter settings that were used to fit the model that differ from the defaults.

allparameters A list containing all parameters used to fit the model.

model A list containing the characteristics of the model returned by the algorithm.

  size The number of points in each cluster.
  totss Total sum of squared error to grand mean.
  withinss A vector of within-cluster sum of squared error.
  tot_withinss Total within-cluster sum of squared error.
  betweenss Between-cluster sum of squared error.

Description

This class represents a connection to an H2O cluster.

Usage

## S4 method for signature 'H2OConnection'
show(object)

Arguments

  object an H2OConnection object.

Details

Because H2O is not a master-slave architecture, there is no restriction on which H2O node is used to establish the connection between R (the client) and H2O (the server).

A new H2O connection is established via the h2o.init() function, which takes as parameters the ‘ip’ and ‘port’ of the machine running an instance to connect with. The default behavior is to connect with a local instance of H2O at port 54321, or to boot a new local instance if one is not found at port 54321.
Slots

ip  A character string specifying the IP address of the H2O cluster.
port  A numeric value specifying the port number of the H2O cluster.
name  A character value specifying the name of the H2O cluster.
proxy  A character specifying the proxy path of the H2O cluster.
https  Set this to TRUE to use https instead of http.
cacert  Path to a CA bundle file with root and intermediate certificates of trusted CAs.
insecure  Set this to TRUE to disable SSL certificate checking.
username  Username to login with.
password  Password to login with.
use_spnego  Set this to TRUE to use SPNEGO authentication.
cookies  Cookies to add to request
context_path  Context path which is appended to H2O server location.
mutable  An H2OConnectionMutableState object to hold the mutable state for the H2O connection.

H2OConnectionMutableState

The H2OConnectionMutableState class

Description

This class represents the mutable aspects of a connection to an H2O cluster.

Slots

session_id  A character string specifying the H2O session identifier.

key_count  A integer value specifying count for the number of keys generated for the session_id.

H2OCoxPHModel-class

The H2OCoxPHModel object.

Description

Virtual object representing H2O's CoxPH Model.
Usage

```r
## S4 method for signature 'H2OCoxPHModel'
show(object)
```

```r
## S3 method for class 'H2OCoxPHModel'
coef(object, ...)
```

```r
## S3 method for class 'H2OCoxPHModel'
extraitAIC(fit, scale, k = 2, ...)
```

```r
## S3 method for class 'H2OCoxPHModel'
logLik(object, ...)
```

```r
survfit.H2OCoxPHModel(formula, newdata, ...)
```

```r
## S3 method for class 'H2OCoxPHModel'
voc(object, ...)
```

Arguments

- `object`: an H2OCoxPHModel object.
- `...`: additional arguments to pass on.
- `fit`: an H2OCoxPHModel object.
- `scale`: optional numeric specifying the scale parameter of the model.
- `k`: numeric specifying the weight of the equivalent degrees of freedom.
- `formula`: an H2OCoxPHModel object.
- `newdata`: an optional H2OFrame or data.frame with the same variable names as those that appear in the H2OCoxPHModel object.

---

H2OCoxPHModelSummary-class

The `H2OCoxPHModelSummary` object.

Description

Wrapper object for summary information compatible with survival package.

Usage

```r
## S4 method for signature 'H2OCoxPHModelSummary'
show(object)
```

```r
## S3 method for class 'H2OCoxPHModelSummary'
coef(object, ...)
```
Arguments

object An H2OcoxPHModelSummary object.
... additional arguments to pass on.

Slots

summary A list containing the a summary compatible with CoxPH summary used in the survival package.

---

H2OFrame-class

The H2OFrame class

Description

This class represents an H2OFrame object

---

H2OFrame-Extract

Extract or Replace Parts of an H2OFrame Object

Description

Operators to extract or replace parts of H2OFrame objects.

Usage

```r
## S3 method for class 'H2OFrame'
data[row, col, drop = TRUE]

## S3 method for class 'H2OFrame'
x$name

## S3 method for class 'H2OFrame'
x[[i, exact = TRUE]]

## S3 method for class 'H2OFrame'
x$name

## S3 method for class 'H2OFrame'
x[[i, exact = TRUE]]

## S3 replacement method for class 'H2OFrame'
data[row, col, ...] <- value

## S3 replacement method for class 'H2OFrame'
data$name <- value
```
## S3 replacement method for class 'H2OFrame'

data[[name]] <- value

### Arguments

data
  object from which to extract element(s) or in which to replace element(s).

row
  index specifying row element(s) to extract or replace. Indices are numeric or
  character vectors or empty (missing) or will be matched to the names.

col
  index specifying column element(s) to extract or replace.

drop
  Unused

x
  An H2OFrame

name
  a literal character string or a name (possibly backtick quoted).

i
  index

exact
  controls possible partial matching of `[[` when extracting a character

...
  Further arguments passed to or from other methods.

value
  To be assigned

### H2OGrid-class

**H2O Grid**

### Description

A class to contain the information about grid results

### Usage

```r
## S4 method for signature 'H2OGrid'
show(object)
```

### Arguments

object
  an `H2OGrid` object.

### Slots

grid_id
  the final identifier of grid

model_ids
  list of model IDs which are included in the grid object

hyper_names
  list of parameter names used for grid search

failed_params
  list of model parameters which caused a failure during model building, it can
  contain a null value

failure_details
  list of detailed messages which correspond to failed parameters field

failure_stack_traces
  list of stack traces corresponding to model failures reported by failed_params
  and failure_details fields

failed_raw_params
  list of failed raw parameters

summary_table
  table of models built with parameters and metric information.
See Also

H2OModel for the final model types.

H2OLeafNode-class

The H2OLeafNode class.

Description

This class represents a single leaf node in an H2OTree.

Details

#’ @aliases H2OLeafNode

H2OModel-class

The H2OModel object.

Description

This virtual class represents a model built by H2O.

Usage

## S4 method for signature 'H2OModel'

show(object)

Arguments

object an H2OModel object.

Details

This object has slots for the key, which is a character string that points to the model key existing in the H2O cluster, the data used to build the model (an object of class H2OFrame).

Slots

model_id A character string specifying the key for the model fit in the H2O cluster’s key-value store.
algorithm A character string specifying the algorithm that were used to fit the model.
parameters A list containing the parameter settings that were used to fit the model that differ from the defaults.
allparameters A list containing all parameters used to fit the model.
have_pojo A logical indicating whether export to POJO is supported
have_mojo A logical indicating whether export to MOJO is supported
model A list containing the characteristics of the model returned by the algorithm.
H2OModelFuture-class  

**H2O Future Model**

**Description**

A class to contain the information for background model jobs.

**Slots**

- `job_key`  a character key representing the identification of the job process.
- `model_id`  the final identifier for the model

**See Also**

- [H2OModel](#) for the final model types.

H2OModelMetrics-class  

**The H2OModelMetrics Object.**

**Description**

A class for constructing performance measures of H2O models.

**Usage**

```r
## S4 method for signature 'H2OModelMetrics'
show(object)

## S4 method for signature 'H2OBinomialMetrics'
show(object)

## S4 method for signature 'H2OMultinomialMetrics'
show(object)

## S4 method for signature 'H2OOrdinalMetrics'
show(object)

## S4 method for signature 'H2ORegressionMetrics'
show(object)

## S4 method for signature 'H2OClusteringMetrics'
show(object)

## S4 method for signature 'H2OAutoEncoderMetrics'
show(object)
```
## S4 method for signature 'H2ODimReductionMetrics'
show(object)

### Arguments
- object: An H2OModelMetrics object

---

### Description

The H2ONode class.

### Usage

```r
## S4 method for signature 'H2ONode'
show(object)
```

### Arguments
- object: an H2ONode object.

### Slots
- id: An integer representing node’s unique identifier. Generated by H2O.
- levels: A character representing categorical levels on split from parent’s node belonging into this node. NULL for root node or non-categorical splits.

---

### H2OSegmentModels-class

**H2O Segment Models**

### Description

A class to contain the information for segment models.

### Usage

```r
## S4 method for signature 'H2OSegmentModels'
show(object)
```

### Arguments
- object: an H2OModel object.
H2OSplitNode-class

Slots

segment_models_id the identifier for the segment models collections

H2OSegmentModelsFuture-class

H2O Future Segment Models

Description

A class to contain the information for background segment models jobs.

Slots

job_key a character key representing the identification of the job process.
segment_models_id the final identifier for the segment models collections

See Also

H2OSegmentModels for the final segment models types.

H2OSplitNode-class

The H2OSplitNode class.

Description

This class represents a single non-terminal node in an H2OTree.

Slots

threshold A numeric split threshold, typically when the split column is numerical.
left_child A H2ONodeOrNULL representing the left child node, if a node has one.
right_child A H2ONodeOrNULL representing the right child node, if a node has one.
split_feature A character representing the name of the column this node splits on.
left_levels A character representing the levels of a categorical feature heading to the left child
of this node. NA for non-categorical split.
right_levels A character representing the levels of a categorical feature heading to the right
child of this node. NA for non-categorical split.
na_direction A character representing the direction of NA values. LEFT means NA values go
to the left child node, RIGH means NA values go to the right child node.
**Description**

This class represents a model of a Tree built by one of H2O’s algorithms (GBM, Random Forest).

**Usage**

```r
## S4 method for signature 'H2OTree'
show(object)
```

**Arguments**

- `object`: an `H2OTree` object.

**Slots**

- `root_node`: A `H2ONode` representing the beginning of the tree behind the model. Allows further tree traversal.
- `left_children`: An integer vector with left child nodes of tree’s nodes.
- `right_children`: An integer vector with right child nodes of tree’s nodes.
- `node_ids`: An integer representing identification number of a node. Node IDs are generated by H2O.
- `descriptions`: A character vector with descriptions for each node to be found in the tree. Contains split threshold if the split is based on numerical column. For categorical splits, it contains list of categorical levels for transition from the parent node.
- `model_id`: A character with the name of the model this tree is related to.
- `tree_number`: An integer representing the order in which the tree has been built in the model.
- `tree_class`: A character representing name of tree’s class. Number of tree classes equals to the number of levels in categorical response column. As there is exactly one class per categorical level, name of tree’s class equals to the corresponding categorical level of response column. In case of regression and binomial, the name of the categorical level is ignored and can be omitted, as there is exactly one tree built in both cases.
- `thresholds`: A numeric split thresholds. Split thresholds are not only related to numerical splits, but might be present in case of categorical split as well.
- `features`: A character with names of the feature/column used for the split.
- `levels`: A character representing categorical levels on split from parent’s node belonging into this node. NULL for root node or non-categorical splits.
- `nas`: A character representing if NA values go to the left node or right node. May be NA if node is a leaf.
- `predictions`: A numeric representing predictions for each node in the graph.
- `tree_decision_path`: A character, plain language rules representation of a trained decision tree.
**decision_paths** A character representing plain language rules that were used in a particular prediction.

**left_cat_split** A character list of categorical levels leading to the left child node. Only present when split is categorical, otherwise none.

**right_cat_split** A character list of categorical levels leading to the right child node. Only present when split is categorical, otherwise none.

---

### housevotes

*United States Congressional Voting Records 1984*

**Description**

This data set includes votes for each of the U.S. House of Representatives Congressmen on the 16 key votes identified by the CQA. The CQA lists nine different types of votes: voted for, paired for, and announced for (these three simplified to yea), voted against, paired against, and announced against (these three simplified to nay), voted present, voted present to avoid conflict of interest, and did not vote or otherwise make a position known (these three simplified to an unknown disposition).

**Format**

A data frame with 435 rows and 17 columns

**Source**

**References**

---

### iris

*Edgar Anderson’s Iris Data*

**Description**

Measurements in centimeters of the sepal length and width and petal length and width, respectively, for three species of iris flowers.

**Format**

A data frame with 150 rows and 5 columns
Source

The data were collected by Anderson, Edgar (1935). The irises of the Gaspe Peninsula, Bulletin of the American Iris Society, 59, 2-5.

---

**is.character**

*Check if character*

**Description**

Check if character

**Usage**

```r
is.character(x)
```

**Arguments**

- `x` An H2OFrame object

**Examples**

```r
## Not run:
library(h2o)
h2o.init()

f <- "https://s3.amazonaws.com/h2o-public-test-data/smalldata/coxph_test/heart.csv"
heart <- h2o.importFile(f)

heart["transplant"] <- as.character(heart["transplant"])
is.character(heart["transplant"])

## End(Not run)
```

---

**is.factor**

*Check if factor*

**Description**

Check if factor

**Usage**

```r
is.factor(x)
```
is.numeric

Arguments

x

An H2OFrame object

Description

Check if numeric

Usage

is.numeric(x)

Arguments

x

An H2OFrame object
Keyed-class

Virtual Keyed class

**Description**
Base class for all objects having a persistent representation on backend.

**length,H2OTree-method**

*Overrides the behavior of length() function on H2OTree class. Returns number of nodes in an H2OTree*

**Description**
Overides the behavior of length() function on H2OTree class. Returns number of nodes in an H2OTree

**Usage**
```r
## S4 method for signature 'H2OTree'
length(x)
```

**Arguments**

- `x` An H2OTree to count nodes for.

**Logical-or**

*Logical or for H2OFrames*

**Description**
Logical or for H2OFrames

**Usage**
```r
\text{||}(x, y)
```

**Arguments**

- `x` An H2OFrame object
- `y` An H2OFrame object
ModelAccessors

Accessor Methods for H2OModel Object

Description

Function accessor methods for various H2O output fields.

Usage

getParms(object)

## S4 method for signature 'H2OModel'
getParms(object)

getCenters(object)

getCentersStd(object)

getWithinSS(object)

getTotWithinSS(object)

getBetweenSS(object)

getTotSS(object)

getIterations(object)

getClusterSizes(object)

## S4 method for signature 'H2OClusteringModel'
getCenters(object)

## S4 method for signature 'H2OClusteringModel'
getCentersStd(object)

## S4 method for signature 'H2OClusteringModel'
getWithinSS(object)

## S4 method for signature 'H2OClusteringModel'
getTotWithinSS(object)

## S4 method for signature 'H2OClusteringModel'
getBetweenSS(object)

## S4 method for signature 'H2OClusteringModel'
getTotSS(object)
## S4 method for signature 'H2OClusteringModel'
getIterations(object)

## S4 method for signature 'H2OClusteringModel'
getClusterSizes(object)

### Arguments

object an **H2OModel** class object.

### Description

Needed to be able to memoise the models

### names.H2OFrame

**Column names of an H2OFrame**

### Description

Column names of an H2OFrame

### Usage

```r
## S3 method for class 'H2OFrame'
names(x)
```

### Arguments

x An **H2OFrame**

### Examples

```r
## Not run:
library(h2o)
h2o.init()

frame <- h2o.createFrame(rows = 6, cols = 2,
categorical_fraction = 0.0,
missing_fraction = 0.7,
seed = 123)

names(frame)

## End(Not run)
```
Ops.H2OFrame

S3 Group Generic Functions for H2O

Description

Methods for group generic functions and H2O objects.

Usage

## S3 method for class 'H2OFrame'
Ops(e1, e2)

## S3 method for class 'H2OFrame'
Math(x, ...)  

## S3 method for class 'H2OFrame'
Math(x, ...)  

## S3 method for class 'H2OFrame'
Math(x, ...)  

## S3 method for class 'H2OFrame'
Summary(x, ..., na.rm)

## S3 method for class 'H2OFrame'
!x

## S3 method for class 'H2OFrame'
is.na(x)

## S3 method for class 'H2OFrame'
t(x)

log(x, ...)

log10(x)

log2(x)

log1p(x)

trunc(x, ...)

x %*% y

nrow.H2OFrame(x)
## S3 method for class 'H2OFrame'
length(x)

h2o.length(x)

## S3 replacement method for class 'H2OFrame'
names(x) <- value
colnames(x) <- value

### Arguments

e1  object
e2  object
x   object
... Further arguments passed to or from other methods.
na.rm logical. whether or not missing values should be removed
y   object
value To be assigned

---

### Description

Plots training set (and validation set if available) scoring history for an H2O Model

### Usage

```r
## S3 method for class 'H2OModel'
plot(x, timestep = "AUTO", metric = "AUTO", ...)
```

### Arguments

- **x**  A fitted H2OModel object for which the scoring history plot is desired.
- **timestep** A unit of measurement for the x-axis.
- **metric** A unit of measurement for the y-axis.
- ... additional arguments to pass on.

### Details

This method dispatches on the type of H2O model to select the correct scoring history. The timestep and metric arguments are restricted to what is available in the scoring history for a particular type of model.
Value

Returns a scoring history plot.

See Also

h2o.deeplearning, h2o.gbm, h2o.glm, h2o.randomForest for model generation in h2o.

Examples

## Not run:
if (requireNamespace("mlbench", quietly=TRUE)) {
  library(h2o)
  h2o.init()

  df <- as.h2o(mlbench::mlbench.friedman1(10000, 1))
  rng <- h2o.runif(df, seed = 1234)
  train <- df[rng < 0.8,]
  valid <- df[rng >= 0.8,]

  gbm <- h2o.gbm(x = 1:10, y = "y", training_frame = train, validation_frame = valid,
                 ntrees = 500, learn_rate = 0.01, score_each_iteration = TRUE)
  plot(gbm)
  plot(gbm, timestep = "duration", metric = "deviance")
  plot(gbm, timestep = "number_of_trees", metric = "deviance")
  plot(gbm, timestep = "number_of_trees", metric = "rmse")
  plot(gbm, timestep = "number_of_trees", metric = "mae")
}
## End(Not run)

plot.H2OTabulate  Plot an H2O Tabulate Heatmap

Description

Plots the simple co-occurrence based tabulation of X vs Y as a heatmap, where X and Y are two Vecs in a given dataset. This function requires suggested ggplot2 package.

Usage

## S3 method for class 'H2OTabulate'
plot(x, xlab = x$cols[1], ylab = x$cols[2], base_size = 12, ...)

Arguments

x An H2OTabulate object for which the heatmap plot is desired.
xlab A title for the x-axis. Defaults to what is specified in the given H2OTabulate object.
predict.H2OAutoML

A title for the y-axis. Defaults to what is specified in the given H2OTabulate object.

base_size

Base font size for plot.

... additional arguments to pass on.

Value

Returns a ggplot2-based heatmap of co-occurrence.

See Also

h2o.tabulate

Examples

## Not run:
library(h2o)
h2o.init()
df <- as.h2o(iris)
tab <- h2o.tabulate(data = df, x = "Sepal.Length", y = "Petal.Width",
weights_column = NULL, nbins_x = 10, nbins_y = 10)
plot(tab)
## End(Not run)

---

predict.H2OAutoML Predict on an AutoML object

Description

Obtains predictions from an AutoML object.

Usage

## S3 method for class 'H2OAutoML'
predict(object, newdata, ...)

## S3 method for class 'H2OAutoML'
h2o.predict(object, newdata, ...)

Arguments

object a fitted H2OAutoML object for which prediction is desired
newdata An H2OFrame object in which to look for variables with which to predict.
... additional arguments to pass on.
Details

This method generated predictions on the leader model from an AutoML run. The order of the rows in the results is the same as the order in which the data was loaded, even if some rows fail (for example, due to missing values or unseen factor levels).

Value

Returns an H2OFrame object with probabilities and default predictions.

Usage

## S3 method for class 'H2OModel'
predict(object, newdata, ...)

## S3 method for class 'H2OModel'
h2o.predict(object, newdata, ...)

Arguments

object a fitted H2OModel object for which prediction is desired
newdata An H2OFrame object in which to look for variables with which to predict.
... additional arguments to pass on.

Details

This method dispatches on the type of H2O model to select the correct prediction/scoring algorithm. The order of the rows in the results is the same as the order in which the data was loaded, even if some rows fail (for example, due to missing values or unseen factor levels).

Value

Returns an H2OFrame object with probabilities and default predictions.

See Also

h2o.deeplearning, h2o.gbm, h2o.glm, h2o.randomForest for model generation in h2o.
Examples

```r
# Not run:
library(h2o)
h2o.init()

f <- "https://s3.amazonaws.com/h2o-public-test-data/smalldata/glm_test/insurance.csv"
insurance <- h2o.importFile(f)
predictors <- colnames(insurance)[1:4]
response <- "Claims"
insurance['Group'] <- as.factor(insurance['Group'])
insurance['Age'] <- as.factor(insurance['Age'])
splits <- h2o.splitFrame(data = insurance, ratios = 0.8, seed = 1234)
train <- splits[[1]]
valid <- splits[[2]]
insurance_gbm <- h2o.gbm(x = predictors, y = response,
training_frame = train,
validation_frame = valid,
distribution = "huber",
huber_alpha = 0.9, seed = 1234)
h2o.predict(insurance_gbm, newdata = insurance)

# End(Not run)
```

---

**predict_contributions.H2OModel**

Predict feature contributions - SHAP values on an H2O Model (only DRF, GBM and XGBoost models).

#### Description

Returned H2OFrame has shape (#rows, #features + 1) - there is a feature contribution column for each input feature, the last column is the model bias (same value for each row). The sum of the feature contributions and the bias term is equal to the raw prediction of the model. Raw prediction of tree-based model is the sum of the predictions of the individual trees before the inverse link function is applied to get the actual prediction. For Gaussian distribution the sum of the contributions is equal to the model prediction.

#### Usage

```r
predict_contributions.H2OModel(
    object,
    newdata,
    output_format = c("original", "compact"),
    ...
)
```

```r
h2o.predict_contributions(
    object,
    newdata,
    output_format = c("original", "compact"),
    ...
)
```
predict_leaf_node_assignment.H2OModel

Predict the Leaf Node Assignment on an H2O Model

Description

Obtains leaf node assignment from fitted H2O model objects.

Arguments

- **object**: a fitted H2OModel object for which prediction is desired
- **newdata**: An H2OFrame object in which to look for variables with which to predict.
- **output_format**: Specify how to output feature contributions in XGBoost - XGBoost by default outputs contributions for 1-hot encoded features, specifying a compact output format will produce a per-feature contribution. Defaults to original.
- **...**: additional arguments to pass on.

Details

Note: Multinomial classification models are currently not supported.

Value

Returns an H2OFrame contain feature contributions for each input row.

See Also

h2o.gbm and h2o.randomForest for model generation in h2o.

Examples

```r
## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
prostate_gbm <- h2o.gbm(3:9, "AGE", prostate)
h2o.predict(prostate_gbm, prostate)
```

```r
## End(Not run)
```
Usage

predict_leaf_node_assignment.H2OModel(
    object,
    newdata,
    type = c("Path", "Node_ID"),
    ...
)

h2o.predict_leaf_node_assignment(
    object,
    newdata,
    type = c("Path", "Node_ID"),
    ...
)

Arguments

object a fitted H2OModel object for which prediction is desired
newdata An H2OFrame object in which to look for variables with which to predict.
type choice of either "Path" when tree paths are to be returned (default); or "Node_ID" when the output
... additional arguments to pass on.

Details

For every row in the test set, return the leaf placements of the row in all the trees in the model. Placements can be represented either by paths to the leaf nodes from the tree root or by H2O’s internal identifiers. The order of the rows in the results is the same as the order in which the data was loaded

Value

Returns an H2OFrame object with categorical leaf assignment identifiers for each tree in the model.

See Also

h2o.gbm and h2o.randomForest for model generation in h2o.

Examples

## Not run:
library(h2o)
h2o.init()
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")
prostate <- h2o.uploadFile(path = prostate_path)
prostate$CAPSULE <- as.factor(prostate$CAPSULE)
prostate_gbm <- h2o.gbm(3:9, "CAPSULE", prostate)
h2o.predict(prostate_gbm, prostate)
h2o.predict_leaf_node_assignment(prostate_gbm, prostate)
## End(Not run)

---

### print.H2OFrame

#### Print An H2OFrame

**Description**

Print An H2OFrame

**Usage**

```r
## S3 method for class 'H2OFrame'
print(x, n = 6L, m = 200L, ...)
```

**Arguments**

- `x`: An H2OFrame object
- `n`: An (Optional) A single integer. If positive, number of rows in `x` to return. If negative, all but the `n` first/last number of rows in `x`. Anything bigger than 20 rows will require asking the server (first 20 rows are cached on the client).
- `m`: An (Optional) A single integer. If positive, number of columns in `x` to return. If negative, all but the `m` first/last number of columns in `x`.
- `...`: Further arguments to be passed from or to other methods.

**Examples**

```r
## Not run:
library(h2o)
h2o.init()

cars <- h2o.importFile(f)
print(cars, n = 8)
```

## End(Not run)
print.H2OTable  

*Print method for H2OTable objects*

### Description

This will print a truncated view of the table if there are more than 20 rows.

### Usage

```r
## S3 method for class 'H2OTable'
print(x, header = TRUE, ...)
```

### Arguments

- **x**: An H2OTable object
- **header**: A logical value dictating whether or not the table name should be printed.
- **...**: Further arguments passed to or from other methods.

### Value

The original x object

### Examples

```r
## Not run:
library(h2o)
h2o.init()

cars <- h2o.importFile(f)
print(cars, header = TRUE)

## End(Not run)
```

---

**prostate**  

*Prostate Cancer Study*

### Description

Baseline exam results on prostate cancer patients from Dr. Donn Young at The Ohio State University Comprehensive Cancer Center.

### Format

A data frame with 380 rows and 9 columns
Source

---

**range.H2OFrame**  
*Range of an H2O Column*

**Description**  
Range of an H2O Column

**Usage**

```r
## S3 method for class 'H2OFrame'
range(..., na.rm = TRUE)
```

**Arguments**

- `...`: An H2OFrame object.
- `na.rm`: Ignore missing values

**Examples**

```r
## Not run:
library(h2o)
h2o.init()
frame <- h2o.createFrame(rows = 6, cols = 2,
categorical_fraction = 0.0,
missing_fraction = 0.7,
seed = 123)
range(frame, na.rm = TRUE)
## End(Not run)
```

---

**scale**  
*Scaling and Centering of an H2OFrame*

**Description**

Centers and/or scales the columns of an H2O dataset.

**Usage**

```r
## S3 method for class 'H2OFrame'
scale(x, center = TRUE, scale = TRUE)
```
show,H2OAutoML-method

Arguments

- **x**: An H2OFrame object.
- **center**: either a logical value or numeric vector of length equal to the number of columns of x.
- **scale**: either a logical value or numeric vector of length equal to the number of columns of x.

Examples

```r
## Not run:
library(h2o)
h2o.init()
iris_hf <- as.h2o(iris)
summary(iris_hf)

# Scale and center all the numeric columns in iris data set
iris_scaled <- scale(iris_hf[, 1:4])
## End(Not run)
```

show,H2OAutoML-method

Format AutoML object in user-friendly way

Description

Format AutoML object in user-friendly way

Usage

```r
## S4 method for signature 'H2OAutoML'
show(object)
```

Arguments

- **object**: an H2OAutoML object.
staged_predict_proba.H2OModel

Predict class probabilities at each stage of an H2O Model

Description

The output structure is analogous to the output of `h2o.predict_leaf_node_assignment`. For each tree \( t \) and class \( c \) there will be a column \( T_t.C_c \) (eg. \( T_3.C_1 \) for tree 3 and class 1). The value will be the corresponding predicted probability of this class by combining the raw contributions of trees \( T_1.C_c,...,T_t.C_c \). Binomial models build the trees just for the first class and values in columns \( T_x.C_1 \) thus correspond to the the probability \( p_0 \).

Usage

```r
staged_predict_proba.H2OModel(object, newdata, ...)  
h2o.staged_predict_proba(object, newdata, ...)
```

Arguments

- **object**: a fitted H2OModel object for which prediction is desired
- **newdata**: An H2OFrame object in which to look for variables with which to predict.
- **...**: additional arguments to pass on.

Value

Returns an H2OFrame object with predicted probability for each tree in the model.

See Also

- `h2o.gbm` and `h2o.randomForest` for model generation in h2o.

Examples

```r
## Not run:  
library(h2o)  
h2o.init()  
prostate_path <- system.file("extdata", "prostate.csv", package = "h2o")  
prostate <- h2o.uploadFile(path = prostate_path)  
prostate$CAPSULE <- as.factor(prostate$CAPSULE)  
prostate_gbm <- h2o.gbm(3:9, "CAPSULE", prostate)  
h2o.predict(prostate_gbm, prostate)  
h2o.staged_predict_proba(prostate_gbm, prostate)  
## End(Not run)
```
str.H2OFrame

Display the structure of an H2OFrame object

Description

Display the structure of an H2OFrame object

Usage

## S3 method for class 'H2OFrame'
str(object, ..., cols = FALSE)

Arguments

object       An H2OFrame.
...          Further arguments to be passed from or to other methods.
cols         Print the per-column str for the H2OFrame

summary,H2OAutoML-method

Format AutoML object in user-friendly way

Description

Format AutoML object in user-friendly way

Usage

## S4 method for signature 'H2OAutoML'
summary(object)

Arguments

object       an H2OAutoML object.
Summary method for `H2OCoxPHModel` objects

Description

Summary method for `H2OCoxPHModel` objects

Usage

```r
## S4 method for signature 'H2OCoxPHModel'
summary(object, conf.int = 0.95, scale = 1)
```

Arguments

- `object`: an `H2OCoxPHModel` object.
- `conf.int`: a specification of the confidence interval.
- `scale`: a scale.

Format grid object in user-friendly way

Description

Format grid object in user-friendly way

Usage

```r
## S4 method for signature 'H2Grid'
summary(object, show_stack_traces = FALSE)
```

Arguments

- `object`: an `H2OGrid` object.
- `show_stack_traces`: a flag to show stack traces for model failures
**Description**

Print the Model Summary

**Usage**

```r
## S4 method for signature 'H2OModel' summary(object, ...)```

**Arguments**

- **object**: An `H2OModel` object.
- **...**: further arguments to be passed on (currently unimplemented)

**Description**

Testing availability of optional package, its version, and extra global default. This function is used internally. It is exported and documented because user can control behavior of the function by global option.

**Usage**

```r
use.package( package, version = "1.9.8"[package == "data.table"], use = getOption("h2o.use.data.table", TRUE)[package == "data.table"] )```

**Arguments**

- **package**: character scalar name of a package that we Suggests or Enhances on.
- **version**: character scalar required version of a package.
- **use**: logical scalar, extra escape option, to be used as global option.
Details

We use this function to control csv read/write with optional data.table package. Currently data.table is enabled by default for some operations, to disable it set options("h2o.use.data.table"=FALSE). It is possible to control just fread or fwrite with options("h2o.fread"=FALSE,"h2o.fwrite"=FALSE). h2o.fread and h2o.fwrite options are not handled in this function but next to fread and fwrite calls.

See Also

as.h2o.data.frame, as.data.frame.H2OFrame

Examples

op <- options("h2o.use.data.table" = TRUE)
if (use.package("data.table")) {
  cat("optional package data.table 1.9.8+ is available\n")
} else {
  cat("optional package data.table 1.9.8+ is not available\n")
}
options(op)

walking Muscular Actuations for Walking Subject

Description

The musculoskeletal model, experimental data, settings files, and results for three-dimensional, muscle-actuated simulations at walking speed as described in Hamner and Delp (2013). Simulations were generated using OpenSim 2.4. The data is available from https://simtk.org/frs/index.php?group_id=603.

Format

A data frame with 151 rows and 124 columns

References
