Package ‘link2GI’

September 3, 2021

Type Package

Title Linking Geographic Information Systems, Remote Sensing and Other Command Line Tools

Version 0.4-7

Date 2021-09-01

Encoding UTF-8

Maintainer Chris Reudenbach <reudenbach@uni-marburg.de>

Description Functions to simplify the linking of open source GIS and remote sensing related command line interfaces.

findGDAL

Search recursively existing 'GDAL binaries' installation(s) at a given drive/mountpoint

Description

Provides an list of valid 'GDAL' installation(s) on your 'Windows' system. There is a major difference between osgeo4W and stand_alone installations. The functions try to find all valid installations by analysing the calling batch scripts.

Usage

findGDAL(searchLocation = "default", quiet = TRUE)

Arguments

- searchLocation  drive letter to be searched, for Windows systems default is C:, for Linux systems default is /usr.
- quiet  boolean switch for supressing console messages default is TRUE
findGRASS

Value

A dataframe with the 'GDAL' root folder(s), and command line executable(s)

Author(s)

Chris Reudenbach

Examples

## Not run:
# find recursively all existing 'GDAL' installations folders starting
# at the default search location
findGDAL()

## End(Not run)

---

findGRASS

Return attributes of valid 'GRASS GIS' installation(s) on the system

Description

Provides a list of valid 'GRASS GIS' installation(s) on your system. There is a major difference between osgeo4W and stand_alone installations. The functions tries to find all valid installations by analysing the calling batch scripts.

Usage

findGRASS(searchLocation = "default", ver_select = FALSE, quiet = TRUE)

Arguments

searchLocation  location to be searched for the grass executable, i.e. one executable for each GRASS installation on the system. For Windows systems it is mandatory to include an uppercase Windows drive letter and a colon. Default For Windows Systems is C:, for Linux systems default is /usr/bin.

ver_select  boolean default is FALSE. If there is more than one 'SAGA GIS' installation and ver_select = TRUE the user can select interactively the preferred 'SAGA GIS' version

quiet  boolean switch for supressing console messages default is TRUE

Value

A dataframe with the 'GRASS GIS' binary folder(s) (i.e. where the individual GRASS commands are installed), version name(s) and installation type code(s)

Author(s)

Chris Reudenbach
findOTB

Search recursively existing 'Orfeo Toolbox' installation(s) at a given drive/mountpoint

Description

Provides a list of valid 'OTB' installation(s) on your 'Windows' system. There is a major difference between osgeo4W and stand-alone installations. The functions tries to find all valid installations by analysing the calling batch scripts.

Usage

findOTB(searchLocation = "default", quiet = TRUE)

Arguments

searchLocation  drive letter to be searched, for Windows systems default is C:, for Linux systems default is /usr.
quiet  boolean switch for suppressing console messages default is TRUE

Value

A dataframe with the 'OTB' root folder(s), and command line executable(s)

Author(s)

Chris Reudenbach

Examples

## Not run:
# find recursively all existing 'GRASS GIS' installation folders starting
# at the default search location
findGRASS()

## End(Not run)
### findSAGA

**Description**

Search recursively existing 'SAGA GIS' installation(s) at a given drive/mountpoint

**Usage**

```r
findSAGA(searchLocation = "default", quiet = TRUE)
```

**Arguments**

- `searchLocation` drive letter to be searched, for Windows systems default is C:, for Linux systems default is /usr.
- `quiet` boolean switch for supressing console messages default is TRUE

**Value**

A dataframe with the 'SAGA GIS' root folder(s), version name(s) and installation type code(s)

**Author(s)**

Chris Reudenbach

**Examples**

```r
## Not run:
# find recursively all existing 'SAGA GIS' installation folders starting
# at the default search location
findSAGA()

## End(Not run)
```

### gvec2sf

**Description**

Converts from an existing GRASS 7 environment an arbitrary vector dataset into a sf object

**Converts from an existing GRASS 7 environment an arbitrary vector dataset into a sf object**
Usage

gvec2sf(x, obj_name, gisdbase, location, gisdbase_exist = TRUE)

Arguments

  x sf object corresponding to the settings of the corresponding GRASS container  
  obj_name name of GRASS layer  
  gisdbase GRASS gisDbase folder  
  location GRASS location name containing obj_name)  
  gisdbase_exist logical switch if the GRASS gisdbase folder exist default is TRUE

Note

  have a look at the sf capabilities to read direct from sqlite

Author(s)

  Chris Reudenbach

Examples

  ## Not run:  
  ## example  
  # get meuse data as sf object  
  require(sf)  
  meuse_sf = st_as_sf(meuse,  
                       coords = c("x", "y"),  
                       crs = 28992,  
                       agr = "constant")

  # write data to GRASS and create gisbase  
  sf2gvec(x = meuse_sf,  
            obj_name = "meuse_R-G",  
            gisdbase = "~/temp3",  
            location = "project1")

  # read from existing GRASS  
  gvec2sf(x = meuse_sf,  
           obj_name = "meuse_R-G",  
           gisdbase = "~/temp3",  
           location = "project1")

  ## End(Not run)
**initProj**  
*Defines and creates folders and variables*

**Description**

Defines and creates (if necessary) all folders variables. Returns a list with the project folder pathes. Optionally exports all pathes to a global sub environment.

**Usage**

```r
initProj(
  projRootDir = tempdir(),
  GRASSlocation = "tmp/",
  projFolders = c("data/", "result/", "run/", "log/"),
  path_prefix = "",
  global = FALSE
)
```

**Arguments**

- `projRootDir`: project github root directory (your github name)
- `GRASSlocation`: folder for GRASS data
- `projFolders`: list of subfolders in project
- `path_prefix`: character a prefix for the path variables names default is ""
- `global`: boolean export path strings as global variables default is false

**Examples**

```r
## Not run:

link2GI::initProj(projRootDir = tempdir(),
  projFolders = c("data/",
     "data/level0/",
     "data/level1/",
     "output/",
     "run/",
     "fun/" )

## End(Not run)
```
Description

A straightforward helper tool for linking GI/RS functionality to R. The goal of the package is to correctly initialize both the existing wrapper packages rgrass7 and RSAGA and to smoothly enable the necessary system variables and path parameters for a direct access of the binaries via direct system calls on all operating systems. In particular, rgrass7 and RSAGA can cause severe problems during initialization of parallel installations of GRASS GIS or SAGA GIS under the Windows operating system(s). link2GI tries to set the correct system settings and returns if system calls are required the necessary paths and command strings.

Furthermore the package provides a linkage to the Orfeo Toolbox (OTB) software. Due to the difficulties linking the correct GDAL binaries a new system wide search for GDAL binaries is implemented.

Finally there are some useful functions for creating project folder structures and project environments. To deal with the not always consistent API-calls of OTB a list based command parser and generator is provided.

Details

Functions for linking GI/RS functionality to R

Note

To utilize the power of the open source GI tools from within R you need to install them first. The link2GI package just tries to generate correct environment settings as system and path variables for the most of the known issues. The installation of the QGIS, GRASS GIS 7.x and SAGA-GIS GIS software is described in the vignettes.

link2GI is tested under Windows 7/10 as well as on the Ubuntu/Debian/Arch Linux distributions. The OSX operation system should run but is not tested (Any help is highly appreciated).

Author(s)

Chris Reudenbach Tim Appelhans

Maintainer: Chris Reudenbach <reudenbach@uni-marburg.de>

Description

brute force search, find and linkl of all link2GI link functions. This is helpful if your system is well setup and the standard linkage procedure will provide the correct linkages.
Usage

```
linkAll(
  links = NULL,
  simple = TRUE,
  linkItems = c("saga", "grass7", "otb", "gdal"),
  sagaArgs = "default",
  grassArgs = "default",
  otbArgs = "default",
  gdalArgs = "default",
  quiet = FALSE
)
```

Arguments

- **links** character. links
- **simple** logical. true make all
- **linkItems** character. list of c("saga","grass7","otb","gdal")
- **sagaArgs** character. full string of sagaArgs
- **grassArgs** character. grassArgs full string of grassArgs
- **otbArgs** character. full string of otbArgs
- **gdalArgs** character. full string of gdalArgs
- **quiet** supress all messages default is FALSE

Note

You may also use the full list of arguments that is made available from the link2GI package, but it is strongly recommended in this case to use directly the single linkage functions from link2GI.

Examples

```
## Not run:
# required packages
require(uavRst)
require(link2GI)

# search, find and create the links to all supported GI software
giLinks<-uavRst::linkAll()

# makes the GDAL linkage verbose
giLinks<-uavRst::linkAll(gdalArgs= "quiet = TRUE")
```

## End(Not run)
linkGDAL

Locate and set up 'GDAL' API bindings

Description

Locate and set up 'GDAL - Geospatial Data Abstraction Librar' API bindings

Usage

```r
linkGDAL(
  bin_GDAL = NULL,
  searchLocation = NULL,
  ver_select = FALSE,
  quiet = TRUE,
  returnPaths = TRUE
)
```

Arguments

- **bin_GDAL**: string contains path to where the gdal binaries are located
- **searchLocation**: string hard drive letter default is C:
- **ver_select**: boolean default is FALSE. If there is more than one 'GDAL' installation and ver_select = TRUE the user can select interactively the preferred 'GDAL' version
- **quiet**: boolean switch for supressing messages default is TRUE
- **returnPaths**: boolean if set to FALSE the pathes of the selected version are written to the PATH variable only, otherwise all paths and versions of the installed GRASS versions ae returned.

Details

It looks for the gdalinfo(.exe) file. If the file is found in a bin folder it is assumed to be a valid 'GDAL' binary installation.

If called without any parameter linkGDAL() it performs a full search over the harddrive C:. If it finds one or more 'GDAL' binaries it will take the first hit. You have to set ver_select = TRUE for an interactive selection of the preferred version.

Value

add gdal pathes to the enviroment and creates global variables path_GDAL

Note

You may also set the path manually. Using a 'OSGeo4W64' [https://trac.osgeo.org/osgeo4w/](https://trac.osgeo.org/osgeo4w/) installation it is typically C:/OSGeo4W64/bin/
Author(s)

Chris Reudenbach

Examples

## Not run:
# call if you do not have any idea if and where GDAL is installed
gdal<-linkGDAL()
if (gdal$exist) {
# call it for a default OSGeo4W installation of the GDAL
print(gdal)
}
## End(Not run)

linkGRASS7

 Locate and set up 'GRASS 7' API bindings

Description

Initializes the session environment and the system paths for an easy access to 'GRASS GIS 7.x'. The correct setup of the spatial and projection parameters is automatically performed by using either an existing and valid raster, sp or sf object, or manually by providing a list containing the minimum parameters needed.

Usage

linkGRASS7(
  x = NULL,
  default_GRASS7 = NULL,
  search_path = NULL,
  ver_select = FALSE,
  gisdbase_exist = FALSE,
  gisdbase = NULL,
  use_home = FALSE,
  location = NULL,
  spatial_params = NULL,
  resolution = NULL,
  quiet = TRUE,
  returnPaths = TRUE
)

Arguments

x       raster or sp object
The concept is straightforward but for an all days usage helpful. Either you need to provide a raster or sp sf spatial object which has correct spatial and projection properties or you may link directly to an existing 'GRASS' gisdbase and mapset. If you choose a spatial object to initialize a correct 'GRASS' mapset it is used to create either a temporary or a permanent rgrass7 environment including the correct 'GRASS 7' structure.

The most time consuming part on 'Windows' Systems is the search process. This can easily take 10 or more minutes. To speed up this process you can also provide a correct parameter set. Best way to do so is to call searchGRASSW or for 'Linux' searchGRASSX manually, and call linkGRASS7 with the version arguments of your choice. linkGRASS7 initializes the usage of GRASS7.

Note

'GRASS GIS 7' is excellently supported by the rgrass7 wrapper package. Nevertheless 'GRASS GIS' is well known for its high demands regarding the correct spatial and reference setup of workspace and environment requirements. This becomes even worse on 'Windows' platforms or if several alternative 'GRASS GIS' installations are available. If one knows what to do the rgrass7 package setup function rgrass7::initGRASS works fine under Linux. This is also valid for well known configurations under the 'Windows' operation system. Nevertheless on university lab or on company computers with restriced privileges and/or using different releases like the 'OS-Geo4W' distribution and the 'GRASS 7' stand-alone installation, or different software releases (e.g. 

```r
default_GRASS7 default is NULL. If is NULL an automatic search for all installed versions is performed. If you provide a valid list the corresponding version is initialized. An example for OSGeo4W64 is: c("C:/OSGeo4W64","grass-7.0.5","osgeo4w")

search_path path or mounting point that will be searched

ver_select boolean if TRUE you may choose interactively the binary version (if found more than one), by default FALSE

gisbase_exist default is FALSE if set to TRUE the arguments gisbase and location are expected to be an existing GRASS gisdbase

gisdbase default is NULL, invoke tempdir() to the 'GRASS' database. Alternativeley you can provide a individual path.

use_home default is FALSE, set the GISRC path to tempdir(), if TRUE the HOME or USER-PROFILE setting is used for writing the GISRC file

location default is NULL, invoke basename(tempfile()) for defining the 'GRASS' location. Alternativeley you can provide a individual path.

spatial_params default is NULL. Instead of a spatial object you may provide the geometry as a list. E.g. c(xmin,ymin,xmax,ymax,proj4_string)

resolution resolution in map units for the GRASS raster cells

quiet boolean switch for supressing console messages default is TRUE

returnPaths boolean if set to FALSE the paths of the selected version are written to the PATH variable only, otherwise all paths and versions of the installed GRASS versions ae returned.

Details

The concept is straightforward but for an all days usage helpful. Either you need to provide a raster or sp sf spatial object which has correct spatial and projection properties or you may link directly to an existing 'GRASS' gisdbase and mapset. If you choose a spatial object to initialize a correct 'GRASS' mapset it is used to create either a temporary or a permanent rgrass7 environment including the correct 'GRASS 7' structure.

The most time consuming part on 'Windows' Systems is the search process. This can easily take 10 or more minutes. To speed up this process you can also provide a correct parameter set. Best way to do so is to call searchGRASSW or for 'Linux' searchGRASSX manually, and call linkGRASS7 with the version arguments of your choice. linkGRASS7 initializes the usage of GRASS7.
'GRASS 7.0.5 and GRASS 7.2.0), it becomes often cumbersome or even impossible to get the correct linkages.
The function `linkGRASS7` tries to find all valid 'GRASS GIS' binaries by analyzing the startup script files of 'GRASS GIS'. After identifying the 'GRASS GIS' binaries all necessary system variables and settings will be generated and passed to a temporary R environmet.

If you have more than one valid installation and run `linkGRASS7()` without arguments, you will be ask to select one.

**Author(s)**

Chris Reudenbach

**Examples**

```r
## Not run:
library(link2GI)
require(sf)

# proj folders
projRootDir<-tempdir()
paths<-link2GI::initProj(projRootDir = projRootDir,
                          projFolders = c("project1/"))

# get data
nc <- st_read(system.file("shape/nc.shp", package="sf"))

# Automatic search and find of GRASS binaries
# using the nc sf data object for spatial referencing
# This is the highly recommended linking procedure for on the fly jobs
# NOTE: if more than one GRASS installation is found you have to choose.
grass<-linkGRASS7(nc,returnPaths = TRUE)
if (grass$exist){

    # CREATE and link to a permanent GRASS folder at "projRootDir", location named "project1"
    linkGRASS7(nc, gisdbase = projRootDir, location = "project1")

    # ONLY LINK to a permanent GRASS folder at "projRootDir", location named "project1"
    linkGRASS7(gisdbase = projRootDir, location = "project1", gisdbase_exist = TRUE )

    # setting up GRASS manually with spatial parameters of the nc data
    proj4_string <- as.character(sp::CRS("+init=epsg:28992"))
    linkGRASS7(spatial_params = c(178605,329714,181390,333611,333611,proj4_string))

    # creating a GRASS gisdbase manually with spatial parameters of the nc data
    # additionally using a peramanent directory "projRootDir" and the location "nc_spatial_params"
    proj4_string <- as.character(sp::CRS("+init=epsg:4267"))
    linkGRASS7(gisdbase = projRootDir,
               location = "nc_spatial_params",
               spatial_params = c(-84.32385, 33.88199,-75.45698,36.58965,proj4_string))

}
```
## Some more examples related to interactive selection or OS specific settings

# SELECT the GRASS installation and define the search location
linkGRASS7(nc, ver_select = TRUE, search_path = "~")

# SELECT the GRASS installation
linkGRASS7(nc, ver_select = TRUE)

# Typical osge4W installation (QGIS), using the meuse sp data object for spatial referencing
linkGRASS7(nc,c("C:/Program Files/QGIS 2.18","grass-7.2.1","osgeo4W"))

# Typical osgeo4W installation (rootdir), using the meuse sp data object for spatial referencing
linkGRASS7(nc,c("C:/OSGeo4W64/","grass-7.2.2","osgeo4W"))

## End(Not run)

---

### linkOTB

*Locate and set up ’Orfeo ToolBox’ API bindings*

#### Description

Locate and set up ’Orfeo ToolBox’ API bindings

#### Usage

```r
linkOTB(
  bin_OTB = NULL,
  root_OTB = NULL,
  type_OTB = NULL,
  searchLocation = NULL,
  ver_select = FALSE,
  quiet = TRUE,
  returnPaths = TRUE
)
```

#### Arguments

- **bin_OTB**: string contains path to where the otb binaries are located
- **root_OTB**: string provides the root folder of the bin_OTB
- **type_OTB**: string
- **searchLocation**: string hard drive letter (Windows) or mounting point (Linux) default for Windows is C:, default for Linux is ~
- **ver_select**: boolean default is FALSE. If there is more than one ’OTB’ installation and ver_select = TRUE the user can select interactively the preferred ’OTB’ version In opposite if FALSE the newest version is automatically choosen.
quiet  boolean switch for suppressing messages default is TRUE
returnPaths  boolean if set to FALSE the paths of the selected version are written to the PATH variable only, otherwise all paths and versions of the installed GRASS versions ae returned.

Details

It looks for the otb-cli.bat file. If the file is found in a bin folder it is assumed to be a valid 'OTB' binary installation.
if called without any parameter linkOTB() it performs a full search over the hardrive C:. If it finds one or more 'OTB' binaries it will take the first hit. You have to set ver_select = TRUE for an interactive selection of the preferred version.

Value

add otb pathes to the enviroment and creates global variables path_OTB

Note

You may also set the path manually. Using a 'OSGeo4W64' https://trac.osgeo.org/osgeo4w/ installation it is typically C:/OSGeo4W64/bin/

Author(s)

Chris Reudenbach

Examples

```r
## Not run:
# call if you do not have any idea if and where OTB is installed
otb<-linkOTB()
if (otb$exist) {
  # call it for a default OSGeo4W installation of the OTB
  print(otb)
}
## End(Not run)
```

linkSAGA  Identifies SAGA GIS Installations and returns linking Informations

Description

Finds the existing SAGA GIS installation(s), generates and sets the necessary path and system variables for a seamless use of the command line calls of the 'SAGA GIS' CLI API, setup valid system variables for calling a default rsaga.env and by this makes available the RSAGA wrapper functions.
All existing installation(s) means that it looks for the saga_cmd or saga_cmd.exe executables. If the file is found it is assumed to be a valid 'SAGA GIS' installation. If it is called without any argument the most recent (i.e. highest) SAGA GIS version will be linked.
Usage

\texttt{linkSAGA(}
\begin{verbatim}
  default_SAGA = NULL,
  searchLocation = "default",
  ver_select = FALSE,
  quiet = TRUE,
  returnPaths = TRUE
\end{verbatim}
\texttt{)}

Arguments

- \texttt{default_SAGA}: string contains path to RSAGA binaries
- \texttt{searchLocation}: drive letter to be searched, for Windows systems default is C:, for Linux systems default is /usr.
- \texttt{ver_select}: boolean default is FALSE. If there is more than one 'SAGA GIS' installation and \texttt{ver_select = TRUE} the user can select interactively the preferred 'SAGA GIS' version
- \texttt{quiet}: boolean switch for supressing console messages default is TRUE
- \texttt{returnPaths}: boolean if set to FALSE the pathes of the selected version are written to the \texttt{PATH} variable only, otherwise all paths and versions of the installed SAGA versions are returned.

Value

A list containing the selected RSAGA path variables \$sagaPath, \$sagaModPath, \$sagaCmd and potentially other installations \$installed

Note

The excellent 'SAGA GIS' wrapper RSAGA package was updated several times however it covers currently (Dec 2019) only 'SAGA GIS' versions from 2.3.1 - 6.3.0 The fast evolution of 'SAGA GIS' makes it highly impracticable to keep the wrapper adaption in line (currently 7.5). RSAGA will meet all linking needs perfectly if you use 'SAGA GIS' versions from 2.0.4 - 7.5.0. However you must call rsaga.env using the rsaga.env(modules = saga$sagaModPath) assuming that saga contains the returnPaths of linkSAGA In addition most recently the very promising Rsagacmd wrapper package is providing a new list oriented wrapping tool.

Examples

```r
## Not run:

# call if you do not have any idea if and where SAGA GIS is installed
# it will return a list with the selected and available SAGA installations
```
### Description

Initialize the environment variables on a 'Windows' OS for using 'GRASS GIS' via `rgrass7`

### Usage

```r
paramGRASSw(
  set_default_GRASS7 = NULL,
  DL = "C:",
  ver_select = FALSE,
  quiet = TRUE
)
```

### Arguments

- **set_default_GRASS7**
  - default = NULL forces a full search for 'GRASS GIS' binaries. You may alternatively provide a vector containing paths and keywords. `c("C:/OSGeo4W64","grass-7.0.5","osgeo4w")` is valid for a typical osgeo4w installation.

- **DL**
  - raster or sp object

- **ver_select**
  - boolean default is FALSE. If there is more than one 'SAGA GIS' installation and `ver_select = TRUE` the user can select interactively the preferred 'SAGA GIS' version

- **quiet**
  - boolean switch for suppressing console messages default is TRUE

### Details

The concept is very straightforward but for an all days usage pretty helpful. You need to provide a raster or a sp object. The derived properties are used to initialize a temporary but static `rgrass7` environment. During the ressession you will have full access to GRASS7 both via the wrapper package as well as the command line. paramGRASSw initializes the usage of GRASS7.
Examples

```r
## Not run:
# automatic retrieval of valid 'GRASS GIS' environment settings
# if more than one is found the user has to choose.
paramGRASSw()

# typical OSGeo4W64 installation
paramGRASSw(c("C:/OSGeo4W64","grass-7.0.5","osgeo4W"))

## End(Not run)
```

paramGRASSx

*Usually for internally usage, get 'GRASS GIS' and rgrass7 parameters on 'Linux' OS*

Description

Initialize and set up `rgrass7` for 'Linux'

Usage

```r
paramGRASSx(
  set_default_GRASS7 = NULL,
  MP = "/usr/bin",
  ver_select = FALSE,
  quiet = TRUE
)
```

Arguments

- `set_default_GRASS7`
  - default = NULL will force a search for 'GRASS GIS' You may provide a valid combination as c("/usr/lib/grass74","7.4.1","grass74")
- `MP`
  - mount point to be searched. default is "/usr/bin"
- `ver_select`
  - if TRUE you must interactively select between alternative installations
- `quiet`
  - boolean switch for suppressing console messages default is TRUE

Details

During the rsession you will have full access to GRASS7 GIS via the rgrass7 wrapper. Additionally you may use also use the API calls of GRASS7 via the command line.
parseOTBAlgorithms

Examples

```r
## Not run:
# automatic retrieval of the GRASS7 enviroment settings
paramGRASSx()

# typical stand_alone installation
paramGRASSx("/usr/bin/grass72")

# typical user defined installation (compiled sources)
paramGRASSx("/usr/local/bin/grass72")

## End(Not run)
```

parseOTBAlgorithms  Get OTB modules

Description

retrieve the OTB module folder content and parses the module names

Usage

```r
parseOTBAlgorithms(gili = NULL)
```

Arguments

```r
gili  optional list of available 'OTB' binaries if not provided 'linkOTB()' is called
```

Examples

```r
## Not run:
## link to the OTB binaries
otblink<-link2GI::linkOTB()

if (otblink$exist) {
  ## parse all modules
  moduleList<-parseOTBAlgorithms(gili = otblink)

  ## print the list
  print(moduleList)

}

## End(Not run)
```
### parseOTBFunction

**Get OTB function argument list**

**Description**

retrieve the choosen function and returns a full argument list with the default settings

**Usage**

```r
parseOTBFunction(algo = NULL, gili = NULL)
```

**Arguments**

- `algo` either the number or the plain name of the ‘OTB’ algorithm that is wanted. Note the correct (of current/choosen version) information is provided by `parseOTBAlgorithms()`
- `gili` optional list of available ‘OTB’ binaries if not provided ‘linkOTB()’ is called

**Examples**

```r
## Not run:
otblink<-link2GI::linkOTB()
if (otblink$exist) {
  ## parse all modules
  algos<-parseOTBAlgorithms(gili = otblink)

### rgb

**RGB ortho-image from an arbitray Marburg Open Forest (MOF) plot**

**Description**

Example data set containing a RGB ortho-image of a small plot sampled in the Maburg University Forest aka Marburg Open Forest (MOF). The resolution is 10 cm, projection ETRS89 UTM32

**Format**

"raster::raster"
**runOTB**

*Execute the OTB command list via system call*

---

**Description**

Wrapper function which paste the OTB command list into a system call compatible string and execute this command.

**Usage**

```runOTB(otbCmdList = NULL, gili = NULL, retRaster = TRUE, quiet = TRUE)
```

**Arguments**

- `otbCmdList`: the OTB algorithm parameter list
- `gili`: optional gis linkage as done by `linkOTB()`
- `retRaster`: boolean if TRUE a raster stack is returned
- `quiet`: boolean switch for suppressing messages default is TRUE

**Details**

`# Please NOTE: You must check the help to identify the correct input file argument codewort ($input_in or $input_il).`

**Examples**

```r
## Not run:
require(link2GI)
require(raster)
require(listviewer)
rgdal::set_thin_PROJ6_warnings(TRUE)

## link to OTB
otblink<-link2GI::linkOTB()

if (otblink$exist) {
  projRootDir<-tempdir()
  data('rgb', package = 'link2GI')
  raster::plotRGB(rgb)
  r<-raster::writeRaster(rgb,
    filename=file.path(projRootDir,"test.tif"),
    format="GTiff",
    overwrite=TRUE)

  ## for an image output example we use the Statistic Extraction,
  algoKeyword<- "LocalStatisticExtraction"

  ## extract the command list for the choosen algorithm
```
```r
setenvGDAL

## End(Not run)
```

---

**setenvGDAL**  
*Usually for internally usage, initializes and set up access to the 'GDAL' command line interface*
setenvGRASSw

Description

Initializes and set up access to the 'GDAL' command line interface

Usage

setenvGDAL(bin_GDAL = NULL)

Arguments

  bin_GDAL  string contains the path to the 'GDAL' binaries

Value

Adds 'GDAL' paths to the environment and creates the variable global string variable gdalCmd, that contains the path to the 'GDAL' binaries.

Examples

## Not run:
## example for the most common default OSGeo4W64 installation of GDAL
setenvGDAL(bin_GDAL = "C:/OSGeo4W64/bin/",
           root_GDAL = "C:/OSGeo4W64")
## End(Not run)

setenvGRASSw

Usually for internally usage, create valid 'GRASS GIS 7.xx' rsession environment settings according to the selected GRASS GIS 7.x and Windows Version

Description

Initializes and set up access to 'GRASS GIS 7.xx' via the rgrass7 wrapper or command line packages. Set and returns all necessary environment variables and additionally returns the GISBASE directory as string.

Usage

setenvGRASSw(
  root_GRASS = NULL,
  grass_version = NULL,
  installation_type = NULL,
  jpgmem = 1e+06,
  quiet = TRUE
)
setenvOTB

Arguments

- **root_GRASS**  grass root directory i.e. "C:\OSGEO4~1",
- **grass_version**  grass version name i.e. "grass-7.0.5"
- **installation_type**  
  two options "osgeo4w" as installed by the 'OSGeo4W'-installer and "NSIS" that is typical for a stand_alone installation of 'GRASS GIS'.
- **jpgmem**  jpeg2000 memory allocation size. Default is 1000000
- **quiet**  boolean switch for supressing console messages default is TRUE

Author(s)

Chris Reudenbach

Examples

```r
## Not run:
# set choosen 'GRASS GIS' installation folders
setenvGRASSw(root_GRASS = "C:\\PROGRA~1\\QGIS2~1.18",
               grass_version = "grass-7.2.1",
               installation_type = "osgeo4W")
## End(Not run)
```

setenvOTB  *Usually for internally usage, initializes and set up access to the 'OTB' command line interface*

Description

Initializes and set up access to the 'OTB' command line interface

Usage

```r
setenvOTB(bin_OTB = NULL, root_OTB = NULL)
```

Arguments

- **bin_OTB**  string contains the path to the 'OTB' binaries
- **root_OTB**  string contains the full string to the root folder containing the 'OTB' installation

Value

Adds 'OTB' paths to the enviroment and creates the variable global string variable `otbCmd`, that contains the path to the 'OTB' binaries.
Examples

```r
## Not run:
## example for the most common default OSGeo4W64 installation of OTB
setenvOTB(bin_OTB = "C:\\OSGeo4W64\\bin\",
root_OTB = "C:\\OSGeo4W64")

## End(Not run)
```

### sf2gvec

Write sf object to GRASS 7 vector utilising an existing or creating a new GRASS7 environment

#### Description
Write sf object to GRASS 7 vector utilising an existing or creating a new GRASS7 environment

#### Usage

```r
sf2gvec(x, obj_name, gisdbase, location, gisdbase_exist = FALSE)
```

#### Arguments

- `x` sf object corresponding to the settings of the corresponding GRASS container
- `obj_name` name of GRASS layer
- `gisdbase` GRASS gisDbase folder
- `location` GRASS location name containing `obj_name`
- `gisdbase_exist` logical switch if the GRASS gisdbase folder exist default is TRUE

#### Note

have a look at the sf capabilities to write direct to sqlite

#### Author(s)

Chris Reudenbach

#### Examples

```r
## Not run:
## example
# get meuse data as sf object
require(sf)
nc <- st_read(system.file("shape/nc.shp", package="sf"))

# write data to GRASS and create gisbase
sf2gvec(x = nc,
        obj_name = "nc_R-G")
```
gisdbase = "~/temp3",
location = "project1")

# read from existing GRASS
gvec2sf(x = nc_R-G,
obj_name = "nc_R-G",
gisdbase = "~/temp3",
location = "project1")

## End(Not run)
