

Package ‘mi4p’

March 23, 2022

Type Package

Title Multiple Imputation for Proteomics

Version 0.9

Date 2022-03-15

Depends R (>= 3.5.0)

biocViews

Imports emmeans, foreach, imp4p, impute, limma, mice, stringr

Suggests Biobase, knitr, R.rsp, markdown, prettydoc, rmarkdown

<frederic.bertrand@utt.fr>

Description A framework for multiple imputation for proteomics is proposed by Marie Chion, Christine Carapito and Frederic Bertrand (2021) <[arxiv:2108.07086](https://arxiv.org/abs/2108.07086)>. It is dedicated to dealing with multiple imputation for proteomics.

`mi4p-package`*The mi4p Package*

Description

A multiple imputation framework ...

Author(s)

This package has been written by Marie Chion, Christine Carapito and Frederic Bertrand. Maintainer: <frederic.bertrand@utt.fr>

References

M. Chion, Ch. Carapito and F. Bertrand (2021). *Accounting for multiple imputation-induced variability for differential analysis in mass spectrometry-based label-free quantitative proteomics*. arxiv:2108.07086. <https://arxiv.org/abs/2108.07086>.

`check.conditions`*Check if the design is valid*

Description

This function check the validity of the conditions

Usage

```
check.conditions(conds)
```

Arguments

`conds` A vector

Value

A list

Author(s)

Samuel Wieczorek originally in the DAPAR package. Included in this package since DAPAR is to be removed from Bioconductor >= 3.15.

Examples

```
## Not run:  
utils::data(Exp1_R25_pept, package='DAPARdata')  
check.conditions(Biobase::pData(Exp1_R25_pept)$Condition)  
  
## End(Not run)
```

check.design	<i>Check if the design is valid</i>
--------------	-------------------------------------

Description

This function check the validity of the experimental design

Usage

```
check.design(sTab)
```

Arguments

sTab The data.frame which correspond to the pData function of MSnbase

Value

A boolean

Author(s)

Thomas Burger, Quentin Giai-Gianetto, Samuel Wieczorek originally in the DAPAR package. Included in this package since DAPAR is to be removed from Bioconductor >= 3.15.

Examples

```
## Not run:  
utils::data(Exp1_R25_pept, package='DAPARdata')  
check.design(Biobase::pData(Exp1_R25_pept)[,1:3])  
  
## End(Not run)
```

datasim	<i>A single simulated dataset</i>
---------	-----------------------------------

Description

This dataset was simulated using the default values of the values of the options of the `protdatasim` function and the `set.seed` value set to 4619.

Format

A data frame with 200 observations on the following 11 variables.

id.obs a numeric vector

X1 a numeric vector

X2 a numeric vector

X3 a numeric vector

X4 a numeric vector

X5 a numeric vector

X6 a numeric vector

X7 a numeric vector

X8 a numeric vector

X9 a numeric vector

X10 a numeric vector

Author(s)

M. Chion, Ch. Carapito and F. Bertrand.

Source

We simulated the data.

References

M. Chion, Ch. Carapito and F. Bertrand (2021). *Accounting for multiple imputation-induced variability for differential analysis in mass spectrometry-based label-free quantitative proteomics*. arxiv:2108.07086. <https://arxiv.org/abs/2108.07086>.

Examples

```
data(datasim)
str(datasim)
```

eBayes.mod

*MI-aware Modified eBayes Function***Description**

Modified eBayes function to be used instead of the one in the limma package

Usage

```
eBayes.mod(
  fit,
  VarRubin,
  proportion = 0.01,
  stdev.coef.lim = c(0.1, 4),
  trend = FALSE,
  robust = FALSE,
  winsor.tail.p = c(0.05, 0.1)
)
```

Arguments

<code>fit</code>	an MArrayLM fitted model object produced by <code>lmFit</code> or <code>contrasts.fit</code> . For <code>ebayes</code> only, <code>fit</code> can alternatively be an unclassed list produced by <code>lm.series</code> , <code>gls.series</code> or <code>mrlm</code> containing components <code>coefficients</code> , <code>stdev.unscaled</code> , <code>sigma</code> and <code>df.residual</code> .
<code>VarRubin</code>	a variance-covariance matrix.
<code>proportion</code>	numeric value between 0 and 1, assumed proportion of genes which are differentially expressed
<code>stdev.coef.lim</code>	numeric vector of length 2, assumed lower and upper limits for the standard deviation of log ₂ -fold-changes for differentially expressed genes
<code>trend</code>	logical, should an intensity-trend be allowed for the prior variance? Default is that the prior variance is constant.
<code>robust</code>	logical, should the estimation of <code>df.prior</code> and <code>var.prior</code> be robustified against outlier sample variances?
<code>winsor.tail.p</code>	numeric vector of length 1 or 2, giving left and right tail proportions of <code>x</code> to <code>Winsorize</code> . Used only when <code>robust=TRUE</code> .

Value

`eBayes` produces an object of class `MArrayLM` (see `MArrayLM-class`) containing everything found in `fit` plus the following added components:

t numeric matrix of moderated t-statistics.

p.value numeric matrix of two-sided p-values corresponding to the t-statistics.

lods numeric matrix giving the log-odds of differential expression (on the natural log scale).

s2.prior estimated prior value for σ^2 . A row-wise vector if covariate is non-NULL, otherwise a single value.

df.prior degrees of freedom associated with s2.prior. A row-wise vector if robust=TRUE, otherwise a single value.

df.total row-wise numeric vector giving the total degrees of freedom associated with the t-statistics for each gene. Equal to df.prior+df.residual or sum(df.residual), whichever is smaller.

s2.post row-wise numeric vector giving the posterior values for σ^2 .

var.prior column-wise numeric vector giving estimated prior values for the variance of the log2-fold-changes for differentially expressed gene for each contrast. Used for evaluating lods.

F row-wise numeric vector of moderated F-statistics for testing all contrasts defined by the columns of fit simultaneously equal to zero.

F.p.value row-wise numeric vector giving p-values corresponding to F.

The matrices t, p.value and lods have the same dimensions as the input object fit, with rows corresponding to genes and columns to coefficients or contrasts. The vectors s2.prior, df.prior, df.total, F and F.p.value correspond to rows, with length equal to the number of genes. The vector var.prior corresponds to columns, with length equal to the number of contrasts. If s2.prior or df.prior have length 1, then the same value applies to all genes.

s2.prior, df.prior and var.prior contain empirical Bayes hyperparameters used to obtain df.total, s2.post and lods.

Author(s)

Modified by M. Chion and F. Bertrand. Original by Gordon Smyth and Davis McCarthy

Examples

```
library(mi4p)
data(datasim)
datasim_imp <- multi.impute(data = datasim[,-1], conditions =
  attr(datasim,"metadata")$Condition, method = "MLE")
VarRubin.matrix <- rubin2.all(datasim_imp[1:5,,],
  attr(datasim,"metadata")$Condition)
set.seed(2016)
sigma2 <- 0.05 / rchisq(100, df=10) * 10
y <- datasim_imp[,1]
design <- cbind(Intercept=1,Group=as.numeric(
  attr(datasim,"metadata")$Condition)-1)
fit.model <- limma::lmFit(y,design)
eBayes.mod(fit=fit.model,VarRubin.matrix[[1]])
```

formatLimmaResult *Format a Result from Limma*

Description

It is not exported by DAPAR and has to be reproduced here.

Usage

```
formatLimmaResult(fit, conds, contrast)
```

Arguments

fit	Limma fit
conds	Condition vector
contrast	Contrast vector

Value

A list of two dataframes : logFC and P_Value. The first one contains the logFC values of all the comparisons (one column for one comparison), the second one contains the pvalue of all the comparisons (one column for one comparison). The names of the columns for those two dataframes are identical and correspond to the description of the comparison.

Author(s)

Adapted from the code of Samuel Wieczorek in the DAPAR package as it is an object that is not exported by the DAPAR package.

Examples

```
# library(DAPAR)
set.seed(2016)
data(qData)
data(sTab)
contrast=1
sTab.old <- sTab
conds <- factor(sTab$Condition, levels = unique(sTab$Condition))
sTab <- sTab[unlist(lapply(split(sTab, conds), function(x) {
  x["Sample.name"]
})), ]
qData <- qData[, unlist(lapply(split(sTab.old, conds), function(x) {
  x["Sample.name"]
}))]
conds <- conds[order(conds)]
res.l <- NULL
design.matrix <- mi4p::make.design(sTab)
contra <- mi4p::make.contrast(design.matrix, condition = conds,
```

```

                                contrast)
cmtx <- limma::makeContrasts(contrasts = contra, levels = make.names(colnames(design.matrix)))
fit <- limma::eBayes(limma::contrasts.fit(limma::lmFit(qData,
                                                design.matrix), cmtx))
res.l <- mi4p::formatLimmaResult(fit, conds, contrast)

```

hid.ebayes

MI-aware Modified eBayes Function

Description

Modified eBayes function to be used instead of the one, `.ebayes`, implemented in the `limma` package

Usage

```

hid.ebayes(
  fit,
  VarRubin,
  mod = TRUE,
  proportion = 0.01,
  stdev.coef.lim = c(0.1, 4),
  trend = FALSE,
  robust = FALSE,
  winsor.tail.p = c(0.05, 0.1)
)

```

Arguments

<code>fit</code>	an MArrayLM fitted model object produced by <code>lmFit</code> or <code>contrasts.fit</code> . For <code>ebayes</code> only, <code>fit</code> can alternatively be an unclassed list produced by <code>lm.series</code> , <code>gls.series</code> or <code>mrlm</code> containing components <code>coefficients</code> , <code>stdev.unscaled</code> , <code>sigma</code> and <code>df.residual</code> .
<code>VarRubin</code>	a variance-covariance matrix.
<code>mod</code>	TRUE (not used at the moment)
<code>proportion</code>	numeric value between 0 and 1, assumed proportion of genes which are differentially expressed
<code>stdev.coef.lim</code>	numeric vector of length 2, assumed lower and upper limits for the standard deviation of log ₂ -fold-changes for differentially expressed genes
<code>trend</code>	logical, should an intensity-trend be allowed for the prior variance? Default is that the prior variance is constant.
<code>robust</code>	logical, should the estimation of <code>df.prior</code> and <code>var.prior</code> be robustified against outlier sample variances?
<code>winsor.tail.p</code>	numeric vector of length 1 or 2, giving left and right tail proportions of <code>x</code> to Winsorize. Used only when <code>robust=TRUE</code> .

Value

eBayes produces an object of class MArrayLM (see MArrayLM-class) containing everything found in `fit` plus the following added components:

t numeric matrix of moderated t-statistics.

p.value numeric matrix of two-sided p-values corresponding to the t-statistics.

lods numeric matrix giving the log-odds of differential expression (on the natural log scale).

s2.prior estimated prior value for σ^2 . A row-wise vector if covariate is non-NULL, otherwise a single value.

df.prior degrees of freedom associated with `s2.prior`. A row-wise vector if `robust=TRUE`, otherwise a single value.

df.total row-wise numeric vector giving the total degrees of freedom associated with the t-statistics for each gene. Equal to `df.prior+df.residual` or `sum(df.residual)`, whichever is smaller.

s2.post row-wise numeric vector giving the posterior values for σ^2 .

var.prior column-wise numeric vector giving estimated prior values for the variance of the log2-fold-changes for differentially expressed gene for each contrast. Used for evaluating `lods`.

F row-wise numeric vector of moderated F-statistics for testing all contrasts defined by the columns of `fit` simultaneously equal to zero.

F.p.value row-wise numeric vector giving p-values corresponding to `F`.

The matrices `t`, `p.value` and `lods` have the same dimensions as the input object `fit`, with rows corresponding to genes and columns to coefficients or contrasts. The vectors `s2.prior`, `df.prior`, `df.total`, `F` and `F.p.value` correspond to rows, with length equal to the number of genes. The vector `var.prior` corresponds to columns, with length equal to the number of contrasts. If `s2.prior` or `df.prior` have length 1, then the same value applies to all genes.

`s2.prior`, `df.prior` and `var.prior` contain empirical Bayes hyperparameters used to obtain `df.total`, `s2.post` and `lods`.

Author(s)

Modified by M. Chion and F. Bertrand. Original by Gordon Smyth and Davis McCarthy

Examples

```
library(mi4p)
data(datasim)
datasim_imp <- multi.impute(data = datasim[,-1], conditions =
  attr(datasim,"metadata")$Condition, method = "MLE")
VarRubin.matrix <- rubin2.all(datasim_imp[1:5,],
  attr(datasim,"metadata")$Condition)
set.seed(2016)
sigma2 <- 0.05 / rchisq(100, df=10) * 10
y <- datasim_imp[,1]
design <- cbind(Intercept=1,Group=as.numeric(
  attr(datasim,"metadata")$Condition)-1)
fit.model <- limma::lmFit(y,design)
hid.ebayes(fit=fit.model,VarRubin.matrix[[1]])
```

limmaCompleteTest.mod *Computes a hierarchical differential analysis*

Description

Modified version of the limmaCompleteTest function from the DAPAR package to return both the fit and the results.

Usage

```
limmaCompleteTest.mod(qData, sTab, comp.type = "OnevsOne")
```

Arguments

qData	A matrix of quantitative data, without any missing values.
sTab	A dataframe of experimental design (pData()).
comp.type	A string that corresponds to the type of comparison. Values are: 'anova1way', 'OnevsOne' and 'OnevsAll'; default is 'OnevsOne'.

Value

A list of two dataframes : logFC and P_Value. The first one contains the logFC values of all the comparisons (one column for one comparison), the second one contains the pvalue of all the comparisons (one column for one comparison). The names of the columns for those two dataframes are identical and correspond to the description of the comparison.

Author(s)

Adapted from H el ene Borges, Thomas Burger, Quentin Giai-Gianetto, Samuel Wieczorek

Examples

```
set.seed(2016)
data(qData)
data(sTab)
limma <- limmaCompleteTest.mod(qData, sTab, comp.type='OnevsOne')
```

make.contrast	<i>Builds the contrast matrix</i>
---------------	-----------------------------------

Description

This function builds the contrast matrix

Usage

```
make.contrast(design, condition, contrast = 1)
```

Arguments

design	The data.frame which correspond to the pData function of MSnbase
condition	xxxxxx
contrast	An integer that Indicates if the test consists of the comparison of each biological condition versus each of the other ones (Contrast=1; for example H0:"C1=C2" vs H1:"C1!=C2", etc.) or each condition versus all others (Contrast=2; e.g. H0:"C1=(C2+C3)/2" vs H1:"C1!=(C2+C3)/2", etc. if there are three conditions).

Value

A contrast matrix

Author(s)

Thomas Burger, Quentin Giai-Gianetto, Samuel Wieczorek originally in the DAPAR package. Included in this package since DAPAR is to be removed from Bioconductor >= 3.15.

Examples

```
## Not run:
utils::data(Exp1_R25_pept, package='DAPARdata')
design <- make.design(Biobase::pData(Exp1_R25_pept))
conds <- Biobase::pData(Exp1_R25_pept)$Condition
make.contrast(design, conds)

## End(Not run)
```

make.design	<i>Builds the design matrix</i>
-------------	---------------------------------

Description

This function builds the design matrix

Usage

```
make.design(sTab)
```

Arguments

sTab The data.frame which correspond to the pData function of MSnbase

Value

A design matrix

Author(s)

Thomas Burger, Quentin Giai-Gianetto, Samuel Wiczorek

Examples

```
## Not run:  
utils::data(Exp1_R25_pept, package='DAPARdata')  
make.design(Biobase::pData(Exp1_R25_pept))  
  
## End(Not run)
```

make.design.1	<i>Builds the design matrix for designs of level 1</i>
---------------	--

Description

This function builds the design matrix for design of level 1

Usage

```
make.design.1(sTab)
```

Arguments

sTab The data.frame which correspond to the pData function of MSnbase

Value

A design matrix

Author(s)

Thomas Burger, Quentin Giai-Gianetto, Samuel Wiczorek

Examples

```
## Not run:  
utils::data(Exp1_R25_pept, package='DAPARdata')  
make.design.1(Biobase::pData(Exp1_R25_pept))  
  
## End(Not run)
```

make.design.2

Builds the design matrix for designs of level 2

Description

This function builds the design matrix for design of level 2

Usage

```
make.design.2(sTab)
```

Arguments

sTab The data.frame which correspond to the pData function of MSnbase

Value

A design matrix

Author(s)

Thomas Burger, Quentin Giai-Gianetto, Samuel Wiczorek

Examples

```
## Not run:  
utils::data(Exp1_R25_pept, package='DAPARdata')  
make.design.2(Biobase::pData(Exp1_R25_pept))  
  
## End(Not run)
```

make.design.3	<i>Builds the design matrix for designs of level 3</i>
---------------	--

Description

This function builds the design matrix for design of level 3

Usage

```
make.design.3(sTab)
```

Arguments

sTab The data.frame which correspond to the pData function of MSnbase

Value

A design matrix

Author(s)

Thomas Burger, Quentin Giai-Gianetto, Samuel Wieczorek originally in the DAPAR package. Included in this package since DAPAR is to be removed from Bioconductor >= 3.15.

Examples

```
## Not run:
utils::data(Exp1_R25_pept, package='DAPARdata')
sTab <-cbind(Biobase::pData(Exp1_R25_pept), Tech.Rep=1:6)
make.design.3(sTab)

## End(Not run)
```

meanImp_emmeans	<i>Multiple Imputation Estimate</i>
-----------------	-------------------------------------

Description

Computes the multiple imputation parameter estimate using the emmeans package.

Usage

```
meanImp_emmeans(ind, peptide = 1, tabdata, metacond)
```

Arguments

ind	index
peptide	name of the peptide
tabdata	dataset
metacond	a factor to specify the groups

Value

A vector.

References

M. Chion, Ch. Carapito and F. Bertrand (2021). *Accounting for multiple imputation-induced variability for differential analysis in mass spectrometry-based label-free quantitative proteomics*. arxiv:2108.07086. <https://arxiv.org/abs/2108.07086>.

Examples

```
library(mi4p)
data(datasim)
datasim_imp <- multi.impute(data = datasim[,-1], conditions =
  attr(datasim,"metadata")$Condition, method = "MLE")
meanImp_emmeans(1,1,datasim_imp,attr(datasim,"metadata")$Condition)
```

mi4limma

Title

Description

Title

Usage

```
mi4limma(qData, sTab, VarRubin, comp.type = "OnevsOne", robust = FALSE)
```

Arguments

qData	A matrix of quantitative data, without any missing values.
sTab	The data.frame which correspond to the pData function of MSnbase
VarRubin	A variance-covariance matrix
comp.type	A string that corresponds to the type of comparison. Values are: 'anova1way', 'OnevsOne' and 'OnevsAll'; default is 'OnevsOne'.
robust	logical, should the estimation of df.prior and var.prior be robustified against outlier sample variances? (as in limma's eBayes)

Value

A list of two dataframes : logFC and P_Value. The first one contains the logFC values of all the comparisons (one column for one comparison), the second one contains the pvalue of all the comparisons (one column for one comparison). The names of the columns for those two dataframes are identical and correspond to the description of the comparison.

References

Examples

```
set.seed(2016)
data(qData)
data(sTab)
fit.limma <- mi4limma(qData, sTab, diag(1,2))
```

multi.impute	<i>Function to impute quantitative datasets</i>
--------------	---

Description

This function creates an array made of slices of imputed dataset. Imputation methods can be chosen from `c("pmm", "midastouch", "sample", "cart", "rf", "mean", "norm", "norm.nob", "norm.boot", "norm.predict")`.

Usage

```
multi.impute(data, conditions, nb.imp = NULL, method, parallel = FALSE)
```

Arguments

data	Dataset to impute.
conditions	Vector with the condition values.
nb.imp	Number of imputed dataset to create.
method	Imputation method, choose from <code>c("pmm", "midastouch", "sample", "cart", "rf", "mean", "norm", "norm.nob", "norm.boot", "norm.predict")</code> .
parallel	Use parallel computing?

Value

a numeric array of dim `c(dim(data),nb.imp)`.

References

M. Chion, Ch. Carapito and F. Bertrand (2021). *Accounting for multiple imputation-induced variability for differential analysis in mass spectrometry-based label-free quantitative proteomics*. arxiv:2108.07086. <https://arxiv.org/abs/2108.07086>.

Examples

```
library(mi4p)
data(datasim)
multi.impute(data = datasim[,-1], conditions = attr(datasim,"metadata")$Condition, method = "MLE")
```

MVgen

Amputation of a dataset

Description

This function is designed to ampute datasets.

Usage

```
MVgen(dataset, prop_NA)
```

Arguments

dataset	dataset to be amputed
prop_NA	desired proportion of missing values in the amputed dataset

Value

A dataset with missing values.

References

M. Chion, Ch. Carapito and F. Bertrand (2021). *Accounting for multiple imputation-induced variability for differential analysis in mass spectrometry-based label-free quantitative proteomics*. arxiv:2108.07086. <https://arxiv.org/abs/2108.07086>.

Examples

```
library(mi4p)
data(datasim)
datasim_amp <- MVgen(datasim, .2)
sum(is.na(datasim_amp))/prod(dim(datasim_amp))
```

 norm.200.m100.sd1.vs.m200.sd1.list

A list of simulated datasets.

Description

This list of 100 datasets was simulated using the default values of the options of the `protdatasim` function and the `set.seed` value set to 4619.

Format

The format is: List of 100 data.frames.

data.frame 200 obs. of 11 variables

proj_matrix

Variance-Covariance Matrix Projection

Description

Use a projection of the given variance-covariance matrix.

Usage

```
proj_matrix(VarRubin.matrix, metadata)
```

Arguments

VarRubin.matrix A variance-covariance matrix.
metadata Metadata of the experiment.

Value

A list of variance-covariance matrices.

References

M. Chion, Ch. Carapito and F. Bertrand (2021). *Accounting for multiple imputation-induced variability for differential analysis in mass spectrometry-based label-free quantitative proteomics*. arxiv:2108.07086. <https://arxiv.org/abs/2108.07086>.

Examples

```
library(mi4p)
data(datasim)
datasim_imp <- multi.impute(data = datasim[,-1], conditions =
  attr(datasim,"metadata")$Condition, method = "MLE")
VarRubin.matrix <- rubin2.all(datasim_imp[1:5,,],
  attr(datasim,"metadata")$Condition)
proj_matrix(VarRubin.matrix, attr(datasim,"metadata"))
```

protdatasim *Data simulation function*

Description

Function to simulate benchmark datasets.

Usage

```
protdatasim(  
  iii = 1,  
  nobs = 200,  
  nobs1 = 10,  
  ng1 = 5,  
  ng2 = 5,  
  mg1 = 100,  
  mg2 = 200,  
  disp1 = 1,  
  disp2 = 1  
)
```

Arguments

iii	A parameter useful to loop over for simulated lists of datasets. It has no effect.
nobs	Number of peptides
nobs1	Number of peptides with differential expressions between the two conditions
ng1	Number of biological replicates in condition A
ng2	Number of biological replicates in condition B
mg1	Mean in condition A
mg2	Mean in condition B
disp1	Dispersion in condition A
disp2	Dispersion in condition B

Value

A data frame with the simulated and attribute metadata.

References

M. Chion, Ch. Carapito and F. Bertrand (2021). *Accounting for multiple imputation-induced variability for differential analysis in mass spectrometry-based label-free quantitative proteomics*. arxiv:2108.07086. <https://arxiv.org/abs/2108.07086>.

Examples

```
data_sim <- protdatasim()
attr(data_sim, "metadata")

norm.200.m100.sd1.vs.m200.sd1_list <- lapply(1:100, protdatasim)
attr(norm.200.m100.sd1.vs.m200.sd1_list[[1]], "metadata")
```

qData

*Extract of the abundances of Exp1_R25_pept dataset***Description**

The data frame qData contains the first 500 rows of six columns that are the quantitation of peptides for the six replicates. They were obtained using the code `exprs(Exp1_R25_pept)[1:500,]`.

Format

The format is: `num [1:500, 1:6] 24.8 24.7 24.6 NA 24.5 ... - attr(*, "dimnames")=List of 2 ..$: chr [1:500] "0" "1" "2" "3"$: chr [1:6] "Intensity_C_R1" "Intensity_C_R2" "Intensity_C_R3" "Intensity_D_R1" ...`

Details

The DAPARdata's Exp1_R25_pept dataset is the final outcome of a quantitative mass spectrometry-based proteomic analysis of two samples containing different concentrations of 48 human proteins (UPS1 standard from Sigma-Aldrich) within a constant yeast background (see Giai Gianetto et al. (2016) for details). It contains the abundance values of the different human and yeast peptides identified and quantified in these two conditions. The two conditions represent the measured abundances of peptides when respectively 25 fmol and 10 fmol of UPS1 human proteins were mixed with the yeast extract before mass spectrometry analyses. This results in a concentration ratio of 2.5. Three technical replicates were acquired for each condition.

Source

The DAPARdata package.

```

rubin1.all	<i>First Rubin rule (all peptide)</i>
------------	---------------------------------------

Description

Computes the first Rubin's rule for all the peptide.

Usage

```
rubin1.all(  
  data,  
  metacond,  
  funcmean = meanImp_emmeans,  
  is.parallel = FALSE,  
  verbose = FALSE  
)
```

Arguments

data	dataset
metacond	a factor to specify the groups
funcmean	function that should be used to compute the mean
is.parallel	should parallel computing be used?
verbose	should messages be displayed?

Value

A vector of estimated parameters.

References

M. Chion, Ch. Carapito and F. Bertrand (2021). *Accounting for multiple imputation-induced variability for differential analysis in mass spectrometry-based label-free quantitative proteomics*. arxiv:2108.07086. <https://arxiv.org/abs/2108.07086>.

Examples

```
library(mi4p)
data(datasim)
datasim_imp <- multi.impute(data = datasim[,-1], conditions =
  attr(datasim,"metadata")$Condition, method = "MLE")
rubin1.all(datasim_imp[1:5,,],funcmean = meanImp_emmeans,
  attr(datasim,"metadata")$Condition)
```

rubin1.one

First Rubin rule (a given peptide)

Description

Computes the first Rubin's rule for a given peptide.

Usage

```
rubin1.one(peptide, data, funcmean = meanImp_emmeans, metacond)
```

Arguments

peptide	peptide for which the variance-covariance matrix should be derived.
data	dataset
funcmean	function that should be used to compute the mean
metacond	a factor to specify the groups

Value

A vector of estimated parameters.

References

M. Chion, Ch. Carapito and F. Bertrand (2021). *Accounting for multiple imputation-induced variability for differential analysis in mass spectrometry-based label-free quantitative proteomics*. arxiv:2108.07086. <https://arxiv.org/abs/2108.07086>.

Examples

```
library(mi4p)
data(datasim)
datasim_imp <- multi.impute(data = datasim[,-1], conditions =
  attr(datasim,"metadata")$Condition, method = "MLE")
rubin1.one(1,datasim_imp,funcmean = meanImp_emmeans,
  attr(datasim,"metadata")$Condition)
```

rubin2.all	<i>Computes the 2nd Rubin's rule (all peptides)</i>
------------	---

Description

Computes the total variance-covariance component in the 2nd Rubin's rule for all peptides.

Usage

```
rubin2.all(  
  data,  
  metacond,  
  funcmean = meanImp_emmeans,  
  funcvar = within_variance_comp_emmeans,  
  is.parallel = FALSE,  
  verbose = FALSE  
)
```

Arguments

data	dataset
metacond	a factor to specify the groups
funcmean	function that should be used to compute the mean
funcvar	function that should be used to compute the variance
is.parallel	should parallel computing be used?
verbose	should messages be displayed?

Value

List of variance-covariance matrices.

References

M. Chion, Ch. Carapito and F. Bertrand (2021). *Accounting for multiple imputation-induced variability for differential analysis in mass spectrometry-based label-free quantitative proteomics*. arxiv:2108.07086. <https://arxiv.org/abs/2108.07086>.

Examples

```
library(mi4p)  
data(datasim)  
datasim_imp <- multi.impute(data = datasim[,-1], conditions =  
  attr(datasim,"metadata")$Condition, method = "MLE")  
rubin2.all(datasim_imp[1:5,],attr(datasim,"metadata")$Condition)
```

`rubin2bt.all`*2nd Rubin's rule Between-Imputation component (all peptides)*

Description

Computes the between-imputation component in the 2nd Rubin's rule for all peptides.

Usage

```
rubin2bt.all(  
  data,  
  funcmean = meanImp_emmeans,  
  metacond,  
  is.parallel = FALSE,  
  verbose = FALSE  
)
```

Arguments

<code>data</code>	dataset
<code>funcmean</code>	function that should be used to compute the mean
<code>metacond</code>	a factor to specify the groups
<code>is.parallel</code>	should parallel computing be used?
<code>verbose</code>	should messages be displayed?

Value

List of variance-covariance matrices.

References

  attr(datasim,"metadata")$Condition)
```

rubin2bt.one	<i>2nd Rubin's rule Between-Imputation Component (a given peptide)</i>
--------------	--

Description

Computes the between-imputation component in the 2nd Rubin's rule for a given peptide.

Usage

```
rubin2bt.one(peptide, data, funcmean, metacond)
```

Arguments

peptide	peptide for which the variance-covariance matrix should be derived.
data	dataset
funcmean	function that should be used to compute the mean
metacond	a factor to specify the groups

Value

A variance-covariance matrix.

References

M. Chion, Ch. Carapito and F. Bertrand (2021). *Accounting for multiple imputation-induced variability for differential analysis in mass spectrometry-based label-free quantitative proteomics*. arxiv:2108.07086. <https://arxiv.org/abs/2108.07086>.

Examples

```
library(mi4p)
data(datasim)
datasim_imp <- multi.impute(data = datasim[,-1], conditions =
  attr(datasim,"metadata")$Condition, method = "MLE")

  attr(datasim,"metadata")$Condition)
```

`rubin2wt.all`*2nd Rubin's rule Within-Variance Component (all peptides)*

Description

Computes the within-variance component in the 2nd Rubin's rule for all peptides.

Usage

```
rubin2wt.all(  
  data,  
  funcvar = mi4p::within_variance_comp_emmeans,  
  metacond,  
  is.parallel = FALSE,  
  verbose = TRUE  
)
```

Arguments

<code>data</code>	dataset
<code>funcvar</code>	function that should be used to compute the variance
<code>metacond</code>	a factor to specify the groups
<code>is.parallel</code>	should parallel computing be used?
<code>verbose</code>	should messages be displayed?

Value

List of variance-covariance matrices.

References

rubin2wt.one(1,datasim_imp,funcvar=within_variance_comp_emmeans,
  attr(datasim,"metadata")$Condition)
```

sTab

Experimental design for the Exp1_R25_pept dataset

Description

The data frame sTab contains the experimental design and gives few informations about the samples. They were obtained using the code `pData(Exp1_R25_pept)`.

Format

A data frame with 6 observations on the following 3 variables.

Sample.name a character vector

Condition a character vector

Bio.Rep a numeric vector

Details

The DAPARdata's Exp1_R25_pept dataset is the final outcome of a quantitative mass spectrometry-based proteomic analysis of two samples containing different concentrations of 48 human proteins (UPS1 standard from Sigma-Aldrich) within a constant yeast background (see Gai Gianetto et al. (2016) for details). It contains the abundance values of the different human and yeast peptides identified and quantified in these two conditions. The two conditions represent the measured abundances of peptides when respectively 25 fmol and 10 fmol of UPS1 human proteins were mixed with the yeast extract before mass spectrometry analyses. This results in a concentration ratio of 2.5. Three technical replicates were acquired for each condition.

```

test.design	<i>Check if xxxxx</i>
-------------	-----------------------

Description

This function check xxxxx

Usage

```
test.design(tab)
```

Arguments

tab A data.frame which correspond to xxxxxx

Value

A list of two items

Author(s)

Thomas Burger, Quentin Giai-Gianetto, Samuel Wieczorek originally in the DAPAR package. Included in this package since DAPAR is to be removed from Bioconductor ≥ 3.15 .

Examples

```
## Not run:
utils::data(Exp1_R25_pept, package='DAPARdata')
test.design(Biobase::pData(Exp1_R25_pept)[,1:3])

## End(Not run)
```

within_variance_comp_emmeans

Multiple Imputation Within Variance Component

Description

Computes the multiple imputation within variance component using the emmeans package.

Usage

```
within_variance_comp_emmeans(ind, peptide, data, metacond)
```

Arguments

ind	index
peptide	name of the peptide
data	dataset
metacond	a factor to specify the groups

Value

A variance-covariance matrix.
