Package ‘mlr3’

March 5, 2024

Title  Machine Learning in R - Next Generation

Version  0.18.0

Description  Efficient, object-oriented programming on the
building blocks of machine learning. Provides 'R6' objects for tasks,
learners, resamplings, and measures. The package is geared towards
scalability and larger datasets by supporting parallelization and
out-of-memory data-backends like databases. While 'mlr3' focuses on
the core computational operations, add-on packages provide additional
functionality.

License  LGPL-3

Depends  R (>= 3.1.0)

Imports  R6 (>= 2.4.1), backports, checkmate (>= 2.0.0), data.table (>=
1.15.0), evaluate, future, future.apply (>= 1.5.0), lgr (>=
0.3.4), mlbench, mlr3measures (>= 0.4.1), mlr3misc (>= 0.14.0),
parallelly, palmerpenguins, paradox (>= 0.10.0), RhpcBLASctl,
uuid

Suggests  Matrix, callr, codetools, datasets, future.callr, mlr3data,
progressr, remotes, rpart, testthat (>= 3.1.0)

Encoding  UTF-8

Config/testthat/edition  3

Config/testthat/parallel  false

NeedsCompilation  no

RoxygenNote  7.3.1

Collate  'mlr_reflections.R' 'BenchmarkResult.R' 'DataBackend.R'
'DataBackendCbind.R' 'DataBackendDataTable.R'
'DataBackendMatrix.R' 'DataBackendRbind.R'
'DataBackendRename.R' 'HotstartStack.R' 'Learner.R'
'LearnerClassif.R' 'mlr_learners.R' 'LearnerClassifDebug.R'
'LearnerClassifFeatureless.R' 'LearnerClassifRpart.R'

mmlr3-package

mlr3: Machine Learning in R - Next Generation

Description

Efficient, object-oriented programming on the building blocks of machine learning. Provides 'R6' objects for tasks, learners, resamplings, and measures. The package is geared towards scalability and larger datasets by supporting parallelization and out-of-memory data-backends like databases. While 'mlr3' focuses on the core computational operations, add-on packages provide additional functionality.

Learn mlr3

- Use cases and examples gallery: https://mlr3gallery.mlr-org.com
- Cheat Sheets: https://github.com/mlr-org/mlr3cheatsheets

mlr3 extensions

- Preprocessing and machine learning pipelines: mlr3pipelines
- Analysis of benchmark experiments: mlr3benchmark
- More classification and regression tasks: mlr3data
- Connector to OpenML: mlr3oml
- Solid selection of good classification and regression learners: mlr3learners
- Even more learners: https://github.com/mlr-org/mlr3extralearners
- Tuning of hyperparameters: mlr3tuning
- Hyperband tuner: mlr3hyperband
• Visualizations for many mlr3 objects: mlr3viz
• Survival analysis and probabilistic regression: mlr3proba
• Cluster analysis: mlr3cluster
• Feature selection filters: mlr3filters
• Feature selection wrappers: mlr3fselect
• Interface to real (out-of-memory) data bases: mlr3db
• Performance measures as plain functions: mlr3measures
• Resampling methods for spatiotemporal data: mlr3spatiotempcv
• Data storage and prediction support for spatial objects: mlr3spatial

Suggested packages
• Parallelization framework: future
• Progress bars: progressr
• Encapsulated evaluation: evaluate, callr (external process)

Package Options
• "mlr3.exec_random": Randomize the order of execution in resample() and benchmark() during parallelization with future. Defaults to TRUE. Note that this does not affect the order of results.
• "mlr3.exec_chunk_size": Number of iterations to perform in a single future::future() during parallelization with future. Defaults to 1.
• "mlr3.exec_chunk_bins": Number of bins to split the iterations into. If set, "mlr3.exec_chunk_size" is ignored.
• "mlr3.debug": If set to TRUE, parallelization via future is disabled to simplify debugging and provide more concise tracebacks. Note that results computed in debug mode use a different seeding mechanism and are not reproducible.
• "mlr3.allow_utf8_names": If set to TRUE, checks on the feature names are relaxed, allowing non-ascii characters in column names. This is an experimental and temporal option to pave the way for text analysis, and will likely be removed in a future version of the package. analysis.
• "mlr3.warn_version_mismatch": Set to FALSE to silence warnings raised during predict if a learner has been trained with a different version version of mlr3.

---

**as_benchmark_result**

Convert to BenchmarkResult

**Description**

Convert object to a BenchmarkResult.

**Usage**

```r
as_benchmark_result(x, ...)
```

```r
## S3 method for class 'BenchmarkResult'
as_benchmark_result(x, ...)
```

```r
## S3 method for class 'ResampleResult'
as_benchmark_result(x, ...)
```
as_data_backend.Matrix

Arguments

- **x** (any)
  - Object to convert.
- **...** (any)
  - Additional arguments.

Value

(BenchmarkResult).

Create a Data Backend

Description

Wraps a DataBackend around data. mlr3 ships with methods for data.frame (converted to a DataBackendDataTable and Matrix from package Matrix (converted to a DataBackendMatrix). Additional methods are implemented in the package mlr3db, e.g. to connect to real DBMS like PostgreSQL (via dbplyr) or DuckDB (via DBI/duckdb).

Usage

```r
## S3 method for class 'Matrix'
as_data_backend(data, primary_key = NULL, dense = NULL, ...)
as_data_backend(data, primary_key = NULL, ...)
```

```r
## S3 method for class 'data.frame'
as_data_backend(data, primary_key = NULL, keep_rownames = FALSE, ...)
```

Arguments

- **data** (data.frame())
  - The input data.frame. Automatically converted to a data.table::data.table().
- **primary_key** (character(1) | integer())
  - Name of the primary key column, or integer vector of row ids.
- **dense** (data.frame())
  - Dense data.
- **...** (any)
  - Additional arguments passed to the respective DataBackend method.
- **keep_rownames** (logical(1) | character(1))
  - If TRUE or a single string, keeps the row names of data as a new column. The column is named like the provided string, defaulting to "..rownames" for keep_rownames == TRUE. Note that the created column will be used as a regular feature by the task unless you manually change the column role. Also see data.table::as.data.table().
as_learner

Value

DataBackend.

See Also

- Package mlr3db to interface out-of-memory data, e.g. SQL servers or duckdb.

Other DataBackend: DataBackend, DataBackendDataTable, DataBackendMatrix

Examples

# create a new backend using the penguins data:
as_data_backend(palmerpenguins::penguins)

---

as_learner | Convert to a Learner

Description

Convert object to a Learner or a list of Learner.

Usage

as_learner(x, ...)

## S3 method for class 'Learner'
as_learner(x, clone = FALSE, discard_state = FALSE, ...)
as_learners(x, ...)

## Default S3 method:
as_learners(x, ...)

## S3 method for class 'list'
as_learners(x, ...)

Arguments

x (any)
Object to convert.

... (any)
Additional arguments.

cloned (logical(1))
If TRUE, ensures that the returned object is not the same as the input x.

discard_state (logical(1)) Whether to discard the state.
as_measure

Convert to a Measure

Description

Convert object to a Measure or a list of Measure.

Usage

as_measure(x, 

## S3 method for class 'NULL'
as_measure(x, task_type = NULL, 

## S3 method for class 'Measure'
as_measure(x, clone = FALSE, 

as_measures(x, 

## Default S3 method:
as_measures(x, 

## S3 method for class 'NULL'
as_measures(x, task_type = NULL, 

## S3 method for class 'list'
as_measures(x, 

Arguments

x (any)
Object to convert.

... (any)
Additional arguments.

task_type (character(1))
Used if x is NULL to construct a default measure for the respective task type. The default measures are stored in mlr_reflections$default_measures.

clone (logical(1))
If TRUE, ensures that the returned object is not the same as the input x.

Value

Measure.
as_prediction

Convert to a Prediction

Description

Convert object to a Prediction or a list of Prediction.

Usage

as_prediction(x, check = FALSE, ...)

## S3 method for class 'Prediction'
as_prediction(x, check = FALSE, ...)

## S3 method for class 'PredictionDataClassif'
as_prediction(x, check = FALSE, ...)

## S3 method for class 'PredictionDataRegr'
as_prediction(x, check = FALSE, ...)

as_predictions(x, predict_sets = "test", ...)

## S3 method for class 'list'
as_predictions(x, predict_sets = "test", ...)

Arguments

x (any)
Object to convert.

check (logical(1))
Perform argument checks and type conversions?

... (any)
Additional arguments.

predict_sets (character())
Prediction sets to operate on, used in aggregate() to extract the matching predict_sets from the ResampleResult. Multiple predict sets are calculated by the respective Learner during resample()/benchmark(). Must be a non-empty subset of \{"train", "test", "holdout\}. If multiple sets are provided, these are first combined to a single prediction object. Default is "test".

Value

Prediction.
as_prediction_classif  Convert to a Classification Prediction

**Description**

Convert object to a `PredictionClassif`.

**Usage**

```r
as_prediction_classif(x, ...)
```

## S3 method for class 'PredictionClassif'

```r
as_prediction_classif(x, ...)
```

## S3 method for class 'data.frame'

```r
as_prediction_classif(x, ...)
```

**Arguments**

- `x` (any)
  - Object to convert.
- `...` (any)
  - Additional arguments.

**Value**

`PredictionClassif`.

**Examples**

```r
# create a prediction object
task = tsk("penguins")
learner = lrn("classif.rpart", predict_type = "prob")
learner$train(task)
p = learner$predict(task)

# convert to a data.table
tab = as.data.table(p)

# convert back to a Prediction
as_prediction_classif(tab)

# split data.table into a list of data.tables
tabs = split(tab, tab$truth)

# convert back to list of predictions
preds = lapply(tabs, as_prediction_classif)

# calculate performance in each group
```
sapply(preds, function(p) p$score())

as_prediction_data  PredictionData

Description

Convert object to a PredictionData or a list of PredictionData.

Usage

as_prediction_data(x, task, row_ids = task$row_ids, check = TRUE, ...)

## S3 method for class 'Prediction'
as_prediction_data(x, task, row_ids = task$row_ids, check = TRUE, ...)

## S3 method for class 'PredictionData'
as_prediction_data(x, task, row_ids = task$row_ids, check = TRUE, ...)

## S3 method for class 'list'
as_prediction_data(
  x,
  task,
  row_ids = task$row_ids,
  check = TRUE,
  ..., 
  train_task
)

Arguments

x  (any)
   Object to convert.

 task  (Task).

 row_ids  integer()
   Row indices.

 check  (logical(1))
   Perform argument checks and type conversions?

...  (any)
   Additional arguments.

 train_task  (Task)
   Task used for training the learner.

Value

PredictionData.
as_prediction_regr

Convert to a Regression Prediction

Description

Convert object to a PredictionRegr.

Usage

as_prediction_regr(x, ...)

## S3 method for class 'PredictionRegr'
as_prediction_regr(x, ...)

## S3 method for class 'data.frame'
as_prediction_regr(x, ...)

Arguments

x (any)
Object to convert.

... (any)
Additional arguments.

Value

PredictionRegr.

Examples

# create a prediction object
task = tsk("mtcars")
learner = lrn("regr.rpart")
learner$train(task)
p = learner$predict(task)

# convert to a data.table
tab = as.data.table(p)

# convert back to a Prediction
as_prediction_regr(tab)

# split data.table into a list of data.tables
tabs = split(tab, cut(tab$truth, 3))

# convert back to list of predictions
preds = lapply(tabs, as_prediction_regr)

# calculate performance in each group
sapply(preds, function(p) p$score())

as_resample_result  Convert to ResampleResult

Description

Convert object to a ResampleResult.

The S3 method for list expects argument x to be a list of Prediction objects and all other relevant objects (Task, Learners, and instantiated Resampling) must be provided, too. A more flexible way to manually create a ResampleResult is implemented in as_result_data().

Usage

as_resample_result(x, ...)

## S3 method for class 'ResampleResult'
as_resample_result(x, ...)

## S3 method for class 'ResultData'
as_resample_result(x, view = NULL, ...)

## S3 method for class 'list'
as_resample_result(x, task, learners, resampling, store_backends = TRUE, ...)

Arguments

x (any)
Object to convert.

... (any)
Currently not used.

view (character())
See construction argument view of ResampleResult.

task (Task).

learners (list of trained Learners).

resampling (Resampling).

store_backends (logical(1))
If set to FALSE, the backends of the Tasks provided in data are removed.

Value

(ResampleResult).
as_resampling

Convert to a Resampling

**Description**

Convert object to a Resampling or a list of Resampling.

**Usage**

```r
as_resampling(x, ...)  
## S3 method for class 'Resampling'
as_resampling(x, clone = FALSE, ...)

as_resamplings(x, ...)

## Default S3 method:
as_resamplings(x, ...)

## S3 method for class 'list'
as_resamplings(x, ...)
```

**Arguments**

- `x` (any)
  - Object to convert.
- `...` (any)
  - Additional arguments.
- `clone` (logical(1))
  - If TRUE, ensures that the returned object is not the same as the input `x`.

as_result_data

Convert to ResultData

**Description**

This function allows to construct or convert to a ResultData object, the result container used by ResampleResult and BenchmarkResult. A ResampleResult or BenchmarkResult can be initialized with the returned object. Note that ResampleResults can be converted to a BenchmarkResult with `as_benchmark_result()` and multiple BenchmarkResults can be combined to a larger BenchmarkResult with the `combine()` method of BenchmarkResult.
Usage

```r
as_result_data(
  task,
  learners,
  resampling,
  iterations,
  predictions,
  learner_states = NULL,
  store_backends = TRUE
)
```

Arguments

- `task` *(Task)*.
- `learners` *(list of trained Learners)*.
- `resampling` *(Resampling)*.
- `iterations` *(integer)*.
- `predictions` *(list of list of Predictions)*.
- `learner_states` *(list)*
  Learner states. If not provided, the states of learners are automatically extracted.
- `store_backends` *(logical(1))*
  If set to FALSE, the backends of the Tasks provided in data are removed.

Value

`ResultData` object which can be passed to the constructor of `ResampleResult`.

Examples

```r
task = tsk("penguins")
learner = lrn("classif.rpart")
resampling = rsmp("cv", folds = 2)$instantiate(task)
iterations = seq_len(resampling$iters)

# manually train two learners.
# store learners and predictions
learners = list()
predictions = list()
for (i in iterations) {
  l = learner$clone(deep = TRUE)
  learners[[i]] = l$train(task, row_ids = resampling$train_set(i))
  predictions[[i]] = list(test = l$predict(task, row_ids = resampling$test_set(i)))
}

rdata = as_result_data(task, learners, resampling, iterations, predictions)
ResampleResult$new(rdata)
```
as_task

Convert to a Task

Description
Convert object to a Task or a list of Task.

Usage
as_task(x, ...)

## S3 method for class 'Task'
as_task(x, clone = FALSE, ...)
as_tasks(x, ...)

## Default S3 method:
as_tasks(x, ...)

## S3 method for class 'list'
as_tasks(x, ...)

Arguments

x (any)
Object to convert.

... (any)
Additional arguments.

clonen (logical(1))
If TRUE, ensures that the returned object is not the same as the input x.

as_task_classif

Convert to a Classification Task

Description
Convert object to a TaskClassif. This is a S3 generic. mlr3 ships with methods for the following objects:

1. TaskClassif: ensure the identity
2. formula, data.frame(), matrix(), Matrix::Matrix() and DataBackend: provides an alternative to the constructor of TaskClassif.
3. TaskRegr: Calls convert_task().

Note that the target column will be converted to a factor(), if possible.
Usage

as_task_classif(x, ...)

## S3 method for class 'TaskClassif'
as_task_classif(x, clone = FALSE, ...)

## S3 method for class 'data.frame'
as_task_classif(
  x,
  target = NULL,
  id = deparse(substitute(x)),
  positive = NULL,
  label = NA_character_,
  ...
)

## S3 method for class 'matrix'
as_task_classif(
  x,
  target,
  id = deparse(substitute(x)),
  label = NA_character_,
  ...
)

## S3 method for class 'Matrix'
as_task_classif(
  x,
  target,
  id = deparse(substitute(x)),
  label = NA_character_,
  ...
)

## S3 method for class 'DataBackend'
as_task_classif(
  x,
  target = NULL,
  id = deparse(substitute(x)),
  positive = NULL,
  label = NA_character_,
  ...
)

## S3 method for class 'TaskRegr'
as_task_classif(
  x,
  target = NULL,
as_task_classif

drop_original_target = FALSE,
drop_levels = TRUE,
...
)

## S3 method for class 'formula'
as_task_classif(
  x,
data,
id = deparse(substitute(data)),
positive = NULL,
label = NA_character_,
...
)

Arguments

x (any)
   Object to convert.
...
   (any)
   Additional arguments.
clone (logical(1))
   If TRUE, ensures that the returned object is not the same as the input x.
target (character(1))
   Name of the target column.
id (character(1))
   Id for the new task. Defaults to the (deparsed and substituted) name of the data argument.
positive (character(1))
   Level of the positive class. See TaskClassif.
label (character(1))
   Label for the new instance.
drop_original_target (logical(1))
   If FALSE (default), the original target is added as a feature. Otherwise the original target is dropped.
drop_levels (logical(1))
   If TRUE (default), unused levels of the new target variable are dropped.
data (data.frame())
   Data frame containing all columns referenced in formula x.

Value

TaskClassif.

Examples

as_task_classif(palmerpenguins::penguins, target = "species")
as_task_regr  

Convert to a Regression Task

Description

Convert object to a TaskRegr. This is a S3 generic. mlr3 ships with methods for the following objects:

1. TaskRegr: ensure the identity
2. formula, data.frame(), matrix(), Matrix::Matrix() and DataBackend: provides an alternative to the constructor of TaskRegr.
3. TaskClassif: Calls convert_task().

Usage

as_task_regr(x, ...)

## S3 method for class 'TaskRegr'
as_task_regr(x, clone = FALSE, ...)

## S3 method for class 'data.frame'
as_task_regr(
  x,
  target = NULL,
  id = deparse(substitute(x)),
  label = NA_character_,
  ...
)

## S3 method for class 'matrix'
as_task_regr(
  x,
  target = NULL,
  id = deparse(substitute(x)),
  label = NA_character_,
  ...
)

## S3 method for class 'Matrix'
as_task_regr(
  x,
  target = NULL,
  id = deparse(substitute(x)),
  label = NA_character_,
  ...
)
## S3 method for class 'DataBackend'

```r
as_task_regr(
  x,
  target = NULL,
  id = deparse(substitute(x)),
  label = NA_character_,
  ...  
)
```

## S3 method for class 'TaskClassif'

```r
as_task_regr(
  x,
  target = NULL,
  drop_original_target = FALSE,
  drop_levels = TRUE,
  ...  
)
```

## S3 method for class 'formula'

```r
as_task_regr(
  x,
  data,
  id = deparse(substitute(data)),
  label = NA_character_,
  ...  
)
```

### Arguments

- **x** *(any)*
  - Object to convert.

- **...** *(any)*
  - Additional arguments.

- **clone** *(logical(1))*
  - If TRUE, ensures that the returned object is not the same as the input `x`.

- **target** *(character(1))*
  - Name of the target column.

- **id** *(character(1))*
  - Id for the new task. Defaults to the (deparsed and substituted) name of the data argument.

- **label** *(character(1))*
  - Label for the new instance.

- **drop_original_target** *(logical(1))*
  - If FALSE (default), the original target is added as a feature. Otherwise the original target is dropped.
as_task_unsupervised

drop_levels (logical(1))
If TRUE (default), unused levels of the new target variable are dropped.
data (data.frame())
Data frame containing all columns referenced in formula x.

Value

TaskRegr.

Examples

as_task_regr(datasets::mtcars, target = "mpg")

as_task_unsupervised Convert to an Unsupervised Task

Description

Convert object to a TaskUnsupervised or a list of TaskUnsupervised.

Usage

as_task_unsupervised(x, ...)

## S3 method for class 'Task'
as_task_unsupervised(x, clone = FALSE, ...)

## S3 method for class 'data.frame'
as_task_unsupervised(
x,
id = deparse(substitute(x)),
label = NA_character_,
...
)

## S3 method for class 'DataBackend'
as_task_unsupervised(
x,
id = deparse(substitute(x)),
label = NA_character_,
...
)

as_tasks_unsupervised(x, ...)

## S3 method for class 'list'
as_tasks_unsupervised(x, clone = FALSE, ...)
benchmark

## S3 method for class 'Task'
as_tasks_unsupervised(x, clone = FALSE, ...)

### Arguments

- **x** (any)
  - Object to convert.
- **...** (any)
  - Additional arguments.
- **clone** (logical(1))
  - If TRUE, ensures that the returned object is not the same as the input x.
- **id** (character(1))
  - Id for the new task. Defaults to the (deparsed and substituted) name of the data argument.
- **label** (character(1))
  - Label for the new instance.

---

**benchmark**  
*Benchmark Multiple Learners on Multiple Tasks*

### Description

Runs a benchmark on arbitrary combinations of tasks (Task), learners (Learner), and resampling strategies (Resampling), possibly in parallel.

### Usage

```r
benchmark(
  design,
  store_models = FALSE,
  store_backends = TRUE,
  encapsulate = NA_character_,
  allow_hotstart = FALSE,
  clone = c("task", "learner", "resampling")
)
```

### Arguments

- **design** (data.frame())
  - Data frame (or data.table::data.table()) with three columns: "task", "learner", and "resampling". Each row defines a resampling by providing a Task, Learner and an instantiated Resampling strategy. The helper function benchmark_grid() can assist in generating an exhaustive design (see examples) and instantiate the Resamplings per Task. Additionally, you can set the additional column 'param_values', see benchmark_grid().
store_models (logical(1))
Store the fitted model in the resulting object. Set to TRUE if you want to further analyse the models or want to extract information like variable importance.

store_backends (logical(1))
Keep the DataBackend of the Task in the ResampleResult? Set to TRUE if your performance measures require a Task, or to analyse results more conveniently. Set to FALSE to reduce the file size and memory footprint after serialization. The current default is TRUE, but this eventually will be changed in a future release.

encapsulate (character(1))
If not NA, enables encapsulation by setting the field Learner$encapsulate to one of the supported values: "none" (disable encapsulation), "try" (captures errors but output is printed to the console and not logged), "evaluate" (execute via evaluate) and "callr" (start in external session via callr). If NA, encapsulation is not changed, i.e. the settings of the individual learner are active. Additionally, if encapsulation is set to "evaluate" or "callr", the fallback learner is set to the featureless learner if the learner does not already have a fallback configured.

allow_hotstart (logical(1))
Determines if learner(s) are hot started with trained models in $hotstart_stack. See also HotstartStack.

clone (character())
Select the input objects to be cloned before proceeding by providing a set with possible values "task", "learner" and "resampling" for Task, Learner and Resampling, respectively. Per default, all input objects are cloned.

Value
BenchmarkResult.

Predict Sets
If you want to compare the performance of a learner on the training with the performance on the test set, you have to configure the Learner to predict on multiple sets by setting the field predict_sets to c("train", "test") (default is "test"). Each set yields a separate Prediction object during resampling. In the next step, you have to configure the measures to operate on the respective Prediction object:

m1 = msr("classif.ce", id = "ce.train", predict_sets = "train")
m2 = msr("classif.ce", id = "ce.test", predict_sets = "test")

The (list of) created measures can finally be passed to $aggregate() or $score().

Parallelization
This function can be parallelized with the future package. One job is one resampling iteration, and all jobs are send to an apply function from future.apply in a single batch. To select a parallel backend, use future::plan().
**Progress Bars**

This function supports progress bars via the package `progressr`. Simply wrap the function call in `progressr::with_progress()` to enable them. Alternatively, call `progressr::handlers()` with `global = TRUE` to enable progress bars globally. We recommend the `progress` package as backend which can be enabled with `progressr::handlers("progress")`.

**Logging**

The `mlr3` uses the `lgr` package for logging. `lgr` supports multiple log levels which can be queried with `getOption("lgr.log_levels")`.

To suppress output and reduce verbosity, you can lower the log from the default level "info" to "warn":

```r
lgr::get_logger("mlr3")$set_threshold("warn")
```

To get additional log output for debugging, increase the log level to "debug" or "trace":

```r
lgr::get_logger("mlr3")$set_threshold("debug")
```

To log to a file or a data base, see the documentation of `lgr:lgr-package`.

**Note**

The fitted models are discarded after the predictions have been scored in order to reduce memory consumption. If you need access to the models for later analysis, set `store_models` to `TRUE`.

**See Also**

- Package `mlr3viz` for some generic visualizations.
- `mlr3benchmark` for post-hoc analysis of benchmark results.

**Examples**

```r
# benchmarking with benchmark_grid()
tasks = lapply(c("penguins", "sonar"), tsk)
learners = lapply(c("classif.featureless", "classif.rpart"), lrn)
resamplings = rsmp("cv", folds = 3)

design = benchmark_grid(tasks, learners, resamplings)
print(design)

set.seed(123)
bmr = benchmark(design)

## Data of all resamplings
```
BenchmarkResult

### Description

This is the result container object returned by `benchmark()`. A `BenchmarkResult` consists of the data of multiple `ResampleResults`. `BenchmarkResults` can be visualized via `mlr3viz`'s `autoplot()` function.

For statistical analysis of benchmark results and more advanced plots, see `mlr3benchmark`. 

```r
head(as.data.table(bmr))

## Aggregated performance values
aggr = bmr$aggregate()
print(aggr)

## Extract predictions of first resampling result
rr = aggr$resample_result[[1]]
as.data.table(rr$prediction())

# Benchmarking with a custom design:
# - fit `classif.featureless` on `penguins` with a 3-fold CV
# - fit `classif.rpart` on `sonar` using a holdout
tasks = list(tsk("penguins"), tsk("sonar"))
learners = list(lrn("classif.featureless"), lrn("classif.rpart"))
resamplings = list(rsmp("cv", folds = 3), rsmp("holdout"))

design = data.table::data.table(
  task = tasks,
  learner = learners,
  resampling = resamplings
)

## Instantiate resamplings
design$resampling = Map(
  function(task, resampling) resampling$clone()$instantiate(task),
  task = design$task, resampling = design$resampling
)

## Run benchmark
bmr = benchmark(design)
print(bmr)

## Get the training set of the 2nd iteration of the featureless learner on penguins
rr = bmr$aggregate()[learner_id == "classif.featureless"]$resample_result[[1]]
rr$resampling$train_set(2)
```
BenchmarkResult

S3 Methods

- `as.data.table(rr, ..., reassemble_learners = TRUE, convert_predictions = TRUE, predict_sets = "test")`
  BenchmarkResult -> `data.table::data.table()`
  Returns a tabular view of the internal data.

- `c(...)`
  (BenchmarkResult, ...) -> BenchmarkResult
  Combines multiple objects convertible to BenchmarkResult into a new BenchmarkResult.

Active bindings

task_type (character(1))
  Task type of objects in the BenchmarkResult. All stored objects (Task, Learner, Prediction) in a single BenchmarkResult are required to have the same task type, e.g., "classif" or "regr". This is NA for empty BenchmarkResults.

tasks (data.table::data.table())
  Table of included Tasks with three columns:
  - "task_hash" (character(1)),
  - "task_id" (character(1)), and
  - "task" (Task).

learners (data.table::data.table())
  Table of included Learners with three columns:
  - "learner_hash" (character(1)),
  - "learner_id" (character(1)), and
  - "learner" (Learner).

  Note that it is not feasible to access learned models via this field, as the training task would be ambiguous. For this reason the returned learner are reset before they are returned. Instead, select a row from the table returned by $score().

resamplings (data.table::data.table())
  Table of included Resamplings with three columns:
  - "resampling_hash" (character(1)),
  - "resampling_id" (character(1)), and
  - "resampling" (Resampling).

resample_results (data.table::data.table())
  Returns a table with three columns:
  - uhash (character()).
  - resample_result (ResampleResult).

n_resample_results (integer(1))
  Returns the total number of stored ResampleResults.

uhashes (character())
  Set of (unique) hashes of all included ResampleResults.
Methods

Public methods:

• BenchmarkResult$new()
• BenchmarkResult$help()
• BenchmarkResult$format()
• BenchmarkResult$print()
• BenchmarkResult$combine()
• BenchmarkResult$score()
• BenchmarkResult$aggregate()
• BenchmarkResult$filter()
• BenchmarkResult$resample_result()
• BenchmarkResult$discard()
• BenchmarkResult$clone()

Method new(): Creates a new instance of this R6 class.

Usage:
BenchmarkResult$new(data = NULL)

Arguments:

data (ResultData)
   An object of type ResultData, either extracted from another ResampleResult, another BenchmarkResult, or manually constructed with as_result_data().

Method help(): Opens the help page for this object.

Usage:
BenchmarkResult$help()

Method format(): Helper for print outputs.

Usage:
BenchmarkResult$format(...) 

Arguments:

... (ignored).

Method print(): Printer.

Usage:
BenchmarkResult$print()

Method combine(): Fuses a second BenchmarkResult into itself, mutating the BenchmarkResult in-place. If the second BenchmarkResult bmr is NULL, simply returns self. Note that you can alternatively use the combine function c() which calls this method internally.

Usage:
BenchmarkResult$combine(bmr)

Arguments:
BmR (BenchmarkResult)

A second BenchmarkResult object.

*Returns:* Returns the object itself, but modified by reference. You need to explicitly $clone()$ the object beforehand if you want to keep the object in its previous state.

**Method** `score()`:

Returns a table with one row for each resampling iteration, including all involved objects: Task, Learner, Resampling, iteration number (integer(1)), and Prediction. If `ids` is set to `TRUE`, character column of extracted ids are added to the table for convenient filtering: "task_id", "learner_id", and "resampling_id". Additionally calculates the provided performance measures and binds the performance scores as extra columns. These columns are named using the id of the respective Measure.

**Usage:**

BenchmarkResult$score(
  measures = NULL,
  ids = TRUE,
  conditions = FALSE,
  predict_sets = "test"
)

**Arguments:**

- `measures` (Measure | list of Measure): Measure(s) to calculate.
- `ids` (logical(1)): Adds object ids ("task_id", "learner_id", "resampling_id") as extra character columns to the returned table.
- `conditions` (logical(1)): Adds condition messages ("warnings", "errors") as extra list columns of character vectors to the returned table.
- `predict_sets` (character()): Prediction sets to operate on, used in `aggregate()` to extract the matching predict_sets from the ResampleResult. Multiple predict sets are calculated by the respective Learner during `resample()`/`benchmark()`. Must be a non-empty subset of {"train", "test", "holdout"}. If multiple sets are provided, these are first combined to a single prediction object. Default is "test".

**Returns:** data.table::data.table().

**Method** `aggregate()`:

Returns a result table where resampling iterations are combined into ResampleResults. A column with the aggregated performance score is added for each Measure, named with the id of the respective measure.

The method for aggregation is controlled by the Measure, e.g. micro aggregation, macro aggregation or custom aggregation. Most measures default to macro aggregation.

Note that the aggregated performances just give a quick impression which approaches work well and which approaches are probably underperforming. However, the aggregates do not account for variance and cannot replace a statistical test. See mlr3viz to get a better impression via boxplots or mlr3benchmark for critical difference plots and significance tests.

For convenience, different flags can be set to extract more information from the returned ResampleResult.
Usage:
BenchmarkResult$aggregate(
    measures = NULL,
    ids = TRUE,
    uhashes = FALSE,
    params = FALSE,
    conditions = FALSE
)

Arguments:
measures (Measure | list of Measure)
  Measure(s) to calculate.
ids (logical(1))
  Adds object ids ("task_id", "learner_id", "resampling_id") as extra character columns for convenient subsetting.
uhashes (logical(1))
  Adds the uhash values of the ResampleResult as extra character column "uhash".
params (logical(1))
  Adds the hyperparameter values as extra list column "params". You can unnest them with mlr3misc::unnest().
conditions (logical(1))
  Adds the number of resampling iterations with at least one warning as extra integer column "warnings", and the number of resampling iterations with errors as extra integer column "errors".

Returns: data.table::data.table().

Method filter(): Subsets the benchmark result. If task_ids is not NULL, keeps all tasks with provided task ids and discards all others tasks. Same procedure for learner_ids and resampling_ids.

Usage:
BenchmarkResult$filter(
    task_ids = NULL,
    task_hashes = NULL,
    learner_ids = NULL,
    learner_hashes = NULL,
    resampling_ids = NULL,
    resampling_hashes = NULL
)

Arguments:
task_ids (character())
  Ids of Tasks to keep.
task_hashes (character())
  Hashes of Tasks to keep.
learner_ids (character())
  Ids of Learners to keep.
learner_hashes (character())
  Hashes of Learners to keep.
BenchmarkResult

resampling_ids (character())
  Ids of Resamplings to keep.
resampling_hashes (character())
  Hashes of Resamplings to keep.

Returns: Returns the object itself, but modified by reference. You need to explicitly $clone() the object beforehand if you want to keep the object in its previous state.

Method resample_result(): Retrieve the i-th ResampleResult, by position or by unique hash uhash. i and uhash are mutually exclusive.

Usage:
BenchmarkResult$resample_result(i = NULL, uhash = NULL)

Arguments:
i (integer(1))
  The iteration value to filter for.
uhash (logical(1))
  The uhash value to filter for.

Returns: ResampleResult.

Method discard(): Shrinks the BenchmarkResult by discarding parts of the internally stored data. Note that certain operations might stop work, e.g. extracting importance values from learners or calculating measures requiring the task’s data.

Usage:
BenchmarkResult$discard(backends = FALSE, models = FALSE)

Arguments:
backends (logical(1))
  If TRUE, the DataBackend is removed from all stored Tasks.
models (logical(1))
  If TRUE, the stored model is removed from all Learners.

Returns: Returns the object itself, but modified by reference. You need to explicitly $clone() the object beforehand if you want to keep the object in its previous state.

Method clone(): The objects of this class are cloneable with this method.

Usage:
BenchmarkResult$clone(deep = FALSE)

Arguments:
deep Whether to make a deep clone.

Note
All stored objects are accessed by reference. Do not modify any extracted object without cloning it first.
See Also

- Package mlr3viz for some generic visualizations.

- mlr3benchmark for post-hoc analysis of benchmark results.

Other benchmark: benchmark(), benchmark_grid()

Examples

```r
set.seed(123)
learners = list(
  lrn("classif.featureless", predict_type = "prob"),
  lrn("classif.rpart", predict_type = "prob")
)

design = benchmark_grid(
  tasks = list(tsk("sonar"), tsk("penguins")),
  learners = learners,
  resamplings = rsmplv("cv", folds = 3)
)
print(design)

bmr = benchmark(design)
print(bmr)

bmr$tasks
bmr$learners

# first 5 resampling iterations
head(as.data.table(bmr, measures = c("classif.acc", "classif.auc")), 5)

# aggregate results
bmr$aggregate()

# aggregate results with hyperparameters as separate columns
mlr3misc::unnest(bmr$aggregate(params = TRUE), "params")

# extract resample result for classif.rpart
rr = bmr$aggregate()[learner_id == "classif.rpart", resample_result][[1]]
print(rr)

# access the confusion matrix of the first resampling iteration
rr$predictions()[[1]]$confusion

# reduce to subset with task id "sonar"
bmr$filter(task_ids = "sonar")
print(bmr)
```
**benchmark_grid**

*Generate a Benchmark Grid Design*

**Description**

Takes a list of Task, a list of Learner and a list of Resampling to generate a design in an `expand.grid()` fashion (a.k.a. cross join or Cartesian product).

There are two modes of operation, depending on the flag **paired**.

- With **paired** set to **FALSE** (default), resampling strategies are not allowed to be instantiated, and instead will be instantiated per task internally. The only exception to this rule applies if all tasks have exactly the same number of rows, and the resamplings are all instantiated for such tasks. The grid will be generated based on the Cartesian product of tasks, learners, and resamplings. Because the resamplings are instantiated on the tasks, reproducibility requires a seed to be set **before** calling this function, as this process is stochastic.

- With **paired** set to **TRUE**, tasks and resamplings are treated as pairs. I.e., you must provide as many tasks as corresponding instantiated resamplings. The grid will be generated based on the Cartesian product of learners and pairs.

**Usage**

```r
benchmark_grid(
  tasks,
  learners,
  resamplings,
  param_values = NULL,
  paired = FALSE
)
```

**Arguments**

- **tasks** (list of Task).
- **learners** (list of Learner).
- **resamplings** (list of Resampling).
- **param_values** (list())
  If you want to try many parameter settings for learners, you can pass them through the design which is optimized to be faster than creating learners for each setting.
  A list of lists of named lists, from outer to inner:
  1. One list element for each Learner.
  2. One list element for each hyperparameter configuration to try.
  3. Named list of hyperparameter settings to set in the Learner, possibly over-writing already set hyperparameters in the Learner.
- **paired** (logical(1))
  Set this to **TRUE** if the resamplings are instantiated on the tasks, i.e., the tasks and resamplings are paired. You need to provide the same number of tasks and instantiated resamplings.
Value

(data.table::data.table()) with the cross product of the input vectors.

See Also

- Package mlr3viz for some generic visualizations.
- mlr3benchmark for post-hoc analysis of benchmark results.

Other benchmark: BenchmarkResult, benchmark()

Examples

tasks = list(tsk("penguins"), tsk("sonar"))
learners = list(lrn("classif.featureless"), lrn("classif.rpart"))
resamplings = list(rsmp("cv"), rsmp("subsampling"))

# Set a seed to ensure reproducibility of the resampling instantiation
set.seed(123)
grid = benchmark_grid(tasks, learners, resamplings)
# the resamplings are now instantiated
head(grid$resampling[[1]]$instance)
print(grid)
## Not run:
benchmark(grid)
## End(Not run)

# paired
learner = lrn("classif.rpart")
task1 = tsk("penguins")
task2 = tsk("german_credit")
res1 = rsmp("holdout")
res2 = rsmp("holdout")
res1$instantiate(task1)
res2$instantiate(task2)
design = benchmark_grid(list(task1, task2), learner, list(res1, res2), paired = TRUE)
print(design)

# manual construction of the grid with data.table::CJ()
grid = data.table::CJ(task = tasks, learner = learners,
                      resampling = resamplings, sorted = FALSE)

# manual instantiation (not suited for a fair comparison of learners!)
Map(function(task, resampling) {
  resampling$instantiate(task)
}, task = grid$task, resampling = grid$resampling)
## Not run:
benchmark(grid)
## End(Not run)
**convert_task**

Convert a Task from One Type to Another

**Description**

The task’s target is replaced by a different column from the data.

**Usage**

```r
convert_task(
  intask,
  target = NULL,
  new_type = NULL,
  drop_original_target = FALSE,
  drop_levels = TRUE
)
```

**Arguments**

- **intask** *(Task)*  
  A Task to be converted.

- **target** *(character(1))*
  New target to be set, must be a column in the intask data. If NULL, no new target is set, and task is converted as-is.

- **new_type** *(character(1))*
  The new task type. Must be in `mlr_reflections$task_types`. If NULL (default), a new task with the same task_type is created.

- **drop_original_target** *(logical(1))*
  If FALSE (default), the original target is added as a feature. Otherwise the original target is dropped.

- **drop_levels** *(logical(1))*
  If TRUE (default), unused levels of the new target variable are dropped.

**Value**

*Task* of requested type.
Description

This is the abstract base class for data backends.

Data backends provide a layer of abstraction for various data storage systems. It is not recommended to work directly with the DataBackend. Instead, all data access is handled transparently via the Task.

This package comes with two implementations for backends:

- `DataBackendDataTable` which stores the data as `data.table::data.table()`.
- `DataBackendMatrix` which stores the data as sparse `Matrix::sparseMatrix()`.

To connect to out-of-memory database management systems such as SQL servers, see the extension package `mlr3db`.

Details

The required set of fields and methods to implement a custom DataBackend is listed in the respective sections (see `DataBackendDataTable` or `DataBackendMatrix` for exemplary implementations of the interface).

Public fields

- `primary_key` (character(1))
  Column name of the primary key column of positive and unique integer row ids.
- `dataFormats` (character())
  Set of supported formats, e.g. "data.table" or "Matrix".

Active bindings

- `hash` (character(1))
  Hash (unique identifier) for this object.
- `col_hashes` (named character)
  Hash (unique identifier) for all columns except the primary_key: A character vector, named by the columns that each element refers to.

Columns of different Tasks or DataBackends that have agreeing col_hashes always represent the same data, given that the same rows are selected. The reverse is not necessarily true: There can be columns with the same content that have different col_hashes.

Methods

Public methods:

- `DataBackend$new()`
- `DataBackend$format()`
• **DataBackend$print()**

**Method** new(): Creates a new instance of this R6 class.

Note: This object is typically constructed via a derived classes, e.g. DataBackendDataTable or DataBackendMatrix, or via the S3 method as_data_backend().

**Usage:**
DataBackend$new(data, primary_key, data_formats = "data.table")

**Arguments:**
- data (any)
  - The format of the input data depends on the specialization. E.g., DataBackendDataTable expects a `data.table::data.table()` and DataBackendMatrix expects a `Matrix::Matrix()` from Matrix.
- primary_key (character(1))
  - Each DataBackend needs a way to address rows, which is done via a column of unique integer values, referenced here by primary_key. The use of this variable may differ between backends.
- data_formats (character())
  - Set of supported data formats which can be processed during $train() and $predict(), e.g. "data.table".

**Method** format(): Helper for print outputs.

**Usage:**
DataBackend/format(...)  
**Arguments:**
... (ignored).

**Method** print(): Printer.

**Usage:**
DataBackend$print()

See Also

- Package mlr3db to interface out-of-memory data, e.g. SQL servers or duckdb.

Other DataBackend: DataBackendDataTable, DataBackendMatrix, as_data_backend.Matrix()

Examples

data = data.table::data.table(id = 1:5, x = runif(5),  
y = sample(letters[1:3], 5, replace = TRUE))

b = DataBackendDataTable$new(data, primary_key = "id")
print(b)
b$head(2)
b$data(rows = 1:2, cols = "x")
b$distinct(rows = b$rownames, "y")
b$missings(rows = b$rownames, cols = names(data))
**Description**

DataBackend for data.table which serves as an efficient in-memory data base.

**Super class**

mlr3::DataBackend -> DataBackendDataTable

**Public fields**

compact_seq logical(1)

If TRUE, row ids are a natural sequence from 1 to nrow(data) (determined internally). In this case, row lookup uses faster positional indices instead of equi joins.

**Active bindings**

rownames (integer())

Returns vector of all distinct row identifiers, i.e. the contents of the primary key column.

colnames (character())

Returns vector of all column names, including the primary key column.

nrow (integer(1))

Number of rows (observations).

ncol (integer(1))

Number of columns (variables), including the primary key column.

**Methods**

**Public methods:**

- DataBackendDataTable$new()
- DataBackendDataTable$data()
- DataBackendDataTable$head()
- DataBackendDataTable$distinct()
- DataBackendDataTable$missings()

**Method** new(): Creates a new instance of this R6 class.

Note that DataBackendDataTable does not copy the input data, while as_data_backend() calls data.table::copy(). as_data_backend() also takes care about casting to a data.table() and adds a primary key column if necessary.

**Usage:**

DataBackendDataTable$new(data, primary_key)

**Arguments:**
data (data.table::data.table())

The input data.table().

primary_key (character(1)|integer())

Name of the primary key column, or integer vector of row ids.

**Method** data(): Returns a slice of the data in the specified format. Currently, the only supported formats are "data.table" and "Matrix". The rows must be addressed as vector of primary key values, columns must be referred to via column names. Queries for rows with no matching row id and queries for columns with no matching column name are silently ignored. Rows are guaranteed to be returned in the same order as rows, columns may be returned in an arbitrary order. Duplicated row ids result in duplicated rows, duplicated column names lead to an exception.

*Usage:*

```
DataBackendDataTable$data(rows, cols, data_format = "data.table")
```

**Arguments:**

rows (positive integer())
Vector or row indices.

cols (character())
Vector of column names.

data_format (character(1))
Desired data format, e.g. "data.table" or "Matrix".

**Method** head(): Retrieve the first n rows.

*Usage:*

```
DataBackendDataTable$head(n = 6L)
```

**Arguments:**

n (integer(1))
Number of rows.

**Returns:** data.table::data.table() of the first n rows.

**Method** distinct(): Returns a named list of vectors of distinct values for each column specified. If na.rm is TRUE, missing values are removed from the returned vectors of distinct values. Non-existing rows and columns are silently ignored.

*Usage:*

```
DataBackendDataTable$distinct(rows, cols, na_rm = TRUE)
```

**Arguments:**

rows (positive integer())
Vector or row indices.

cols (character())
Vector of column names.

na.rm logical(1)
Whether to remove NAs or not.

**Returns:** Named list() of distinct values.

**Method** missings(): Returns the number of missing values per column in the specified slice of data. Non-existing rows and columns are silently ignored.
**Usage:**
DataBackendDataTable$missings(rows, cols)

**Arguments:**
- `rows` (positive integer()): Vector or row indices.
- `cols` (character()): Vector of column names.

**Returns:** Total of missing values per column (named numeric()).

**See Also**
- Package mlr3db to interface out-of-memory data, e.g. SQL servers or duckdb.

Other DataBackend: DataBackend, DataBackendMatrix, as_data_backend.Matrix()

**Examples**
```r
data = as.data.table(palmerpenguins::penguins)
data$id = seq_len(nrow(palmerpenguins::penguins))
b = DataBackendDataTable$new(data = data, primary_key = "id")
print(b)
b$head()
b$data(rows = 100:101, cols = "species")

b$nrow
head(b$rownames)

b$ncol
b$colnames

# alternative construction
as_data_backend(palmerpenguins::penguins)
```

---

**DataBackendMatrix**

**DataBackend for Matrix**

**Description**

DataBackend for Matrix. Data is split into a (numerical) sparse part and an optional dense part. These parts are automatically merged to a sparse format during $\text{data()}$. Note that merging both parts potentially comes with a data loss, as all dense columns are converted to numeric columns.

**Super class**

mlr3::DataBackend -> DataBackendMatrix
Active bindings

rownames (integer())
Returns vector of all distinct row identifiers, i.e. the contents of the primary key column.

colnames (character())
Returns vector of all column names, including the primary key column.

nrow (integer(1))
Number of rows (observations).

ncol (integer(1))
Number of columns (variables), including the primary key column.

Methods

Public methods:

• DataBackendMatrix$new()
• DataBackendMatrix$data()
• DataBackendMatrix$head()
• DataBackendMatrix$distinct()
• DataBackendMatrix$missings()

Method new(): Creates a new instance of this R6 class.

Usage:
DataBackendMatrix$new(data, dense, primary_key = NULL)

Arguments:

data Matrix::Matrix()
The input Matrix::Matrix().
dense data.frame(). Dense data, converted to data.table::data.table().
primary_key (character(1)| integer())
Name of the primary key column, or integer vector of row ids.

Method data(): Returns a slice of the data in the specified format. Currently, the only supported formats are "data.table" and "Matrix". The rows must be addressed as vector of primary key values, columns must be referred to via column names. Queries for rows with no matching row id and queries for columns with no matching column name are silently ignored. Rows are guaranteed to be returned in the same order as rows, columns may be returned in an arbitrary order. Duplicated row ids result in duplicated rows, duplicated column names lead to an exception.

Usage:
DataBackendMatrix$data(rows, cols, data_format = "data.table")

Arguments:

rows (positive integer())
Vector or row indices.
cols (character())
Vector of column names.
data_format (character(1))
Desired data format, e.g. "data.table" or "Matrix".
Method `head()`: Retrieve the first \( n \) rows.

Usage:
DataBackendMatrix$head(n = 6L)

Arguments:
\( n \) (integer(1))
  Number of rows.

Returns: \( \text{data.table}::\text{data.table}() \) of the first \( n \) rows.

Method `distinct()`: Returns a named list of vectors of distinct values for each column specified. If \( \text{na_rm} \) is \( \text{TRUE} \), missing values are removed from the returned vectors of distinct values. Non-existing rows and columns are silently ignored.

Usage:
DataBackendMatrix$distinct(rows, cols, na_rm = TRUE)

Arguments:
rows (positive integer())
  Vector or row indices.
cols (character())
  Vector of column names.
na_rm logical(1)
  Whether to remove NAs or not.

Returns: Named list() of distinct values.

Method `missings()`: Returns the number of missing values per column in the specified slice of data. Non-existing rows and columns are silently ignored.

Usage:
DataBackendMatrix$missings(rows, cols)

Arguments:
rows (positive integer())
  Vector or row indices.
cols (character())
  Vector of column names.

Returns: Total of missing values per column (named numeric()).

See Also

- Package mlr3db to interface out-of-memory data, e.g. SQL servers or duckdb.

Other DataBackend: DataBackend, DataBackendDataTable, as_data_backend.Matrix()
**default_measures**

*Get the Default Measure*

**Description**

Gets the default measures using the information in `mlr_reflections$default_measures`:

- "classif.ce" for classification ("classif")
- "regr.mse" for regression ("regr")
- Add-on package may register additional default measures for their own task types.

**Usage**

`default_measures(task_type)`

**Arguments**

- `task_type` (character(1))
  Get the default measure for the task type `task_type`, e.g., "classif" or "regr". If `task_type` is `NULL`, an empty list is returned.

**Value**

list of `Measure`.

**Examples**

```r
default_measures("classif")
default_measures("regr")
```
Description

This class stores learners for hot starting training, i.e. resuming or continuing from an already fitted model. We assume that hot starting is only possible if a single hyperparameter (also called the fidelity parameter, usually controlling the complexity or expensiveness) is altered and all other hyperparameters are identical.

The HotstartStack stores trained learners which can be potentially used to hot start a learner. Learner automatically hot start while training if a stack is attached to the $hotstart_stack field and the stack contains a suitable learner.

For example, if you want to train a random forest learner with 1000 trees but already have a random forest learner with 500 trees (hot start learner), you can add the hot start learner to the HotstartStack of the expensive learner with 1000 trees. If you now call the train() method (or resample() or benchmark()), a random forest with 500 trees will be fitted and combined with the 500 trees of the hotstart learner, effectively saving you to fit 500 trees.

Hot starting is only supported by learners which have the property "hotstart_forward" or "hotstart_backward". For example, an xgboost model (in mlr3learners) can hot start forward by adding more boosting iterations, and a random forest can go backwards by removing trees. The fidelity parameters are tagged with "hotstart" in learner's parameter set.

Public fields

stack data.table::data.table()
Stores hot start learners.

hotstart_threshold (named numeric(1))
Threshold for storing learners in the stack. If the value of the hotstart parameter is below this threshold, the learner is not added to the stack.

Methods

Public methods:

- HotstartStack$new()
- HotstartStack$add()
- HotstartStack$start_cost()
- HotstartStack$format()
- HotstartStack$print()
- HotstartStack$clone()

Method new(): Creates a new instance of this R6 class.

Usage:

HotstartStack$new(learners = NULL, hotstart_threshold = NULL)

Arguments:
HotstartStack

learners (List of Learners)
Learners are added to the hot start stack. If NULL (default), empty stack is created.

hotstart_threshold (named numeric(1))
Threshold for storing learners in the stack.

Method add(): Add learners to hot start stack.

Usage:
HotstartStack$add(learners)

Arguments:
learners (List of Learners). Learners are added to the hotstart stack.

Returns: self (invisibly).

Method start_cost(): Calculates the cost for each learner of the stack to hot start the target learner.
The following cost values can be returned:
• NA_real_: Learner is unsuitable to hot start target learner.
• -1: Hotstart learner in the stack and target learner are identical.
• 0 Cost for hot starting backwards is always 0.
• > 0 Cost for hot starting forward.

Usage:
HotstartStack$start_cost(learner, task_hash)

Arguments:
learner Learner
Target learner.
task_hash Task
Hash of the task on which the target learner is trained.

Method format(): Helper for print outputs.

Usage:
HotstartStack$format(...)

Arguments:
... (ignored).

Method print(): Printer.

Usage:
HotstartStack$print(...)

Arguments:
... (ignored).

Method clone(): The objects of this class are cloneable with this method.

Usage:
HotstartStack$clone(deep = FALSE)

Arguments:
deep Whether to make a deep clone.
Examples

```r
# train learner on pima task
task = tsk("pima")
learner = lrn("classif.debug", iter = 1)
learner$train(task)

# initialize stack with previously fitted learner
hot = HotstartStack$new(list(learner))

# retrieve learner with increased fidelity parameter
learner = lrn("classif.debug", iter = 2)

# calculate cost of hot starting
hot$start_cost(learner, task$hash)

# add stack with hot start learner
learner$hotstart_stack = hot

# train automatically uses hot start learner while fitting the model
learner$train(task)
```

---

install_pkgs  

**Install (Missing) Packages**

Description

`extract_pkgs()` extracts required package from various objects, including `TaskGenerator`, `Learner`, `Measure` and objects from extension packages such as `mlr3pipelines` or `mlr3filters`. If applied on a list, the function is called recursively on all elements.

`install_pkgs()` calls `extract_pkgs()` internally and proceeds with the installation of extracted packages.

Usage

```r
install_pkgs(x, ...)

extract_pkgs(x)

## S3 method for class 'character'
extract_pkgs(x)

## S3 method for class 'R6'
extract_pkgs(x)

## S3 method for class 'list'
extract_pkgs(x)

## S3 method for class 'ResampleResult'
```
extract_pkgs(x)

## S3 method for class 'BenchmarkResult'
extract_pkgs(x)

### Arguments

- **x**
  - (any)
  - Object with package information (or a list of such objects).

- **...**
  - (any)
  - Additional arguments passed down to `remotes::install_cran()` or `remotes::install_github()`.

### Details

If a package contains a forward slash (`/`), it is assumed to be a package hosted on GitHub in 
"<user>/<repo>" format, and the string will be passed to `remotes::install_github()`. Otherwise, the package name will be passed to `remotes::install_cran()`.

### Value

`extract_pkgs()` returns a character() of package strings, `install_pkgs()` returns the names of extracted packages invisibly.

### Examples

```r
extract_pkgs(lrns(c("regr.rpart", "regr.featureless")))
```

---

### Learner Class

<table>
<thead>
<tr>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>This is the abstract base class for learner objects like LearnerClassif and LearnerRegr. Learners are build around the three following key parts:</td>
</tr>
<tr>
<td>- Methods <code>$train()</code> and <code>$predict()</code> which call internal methods or private methods <code>$train()</code>/$ predictions().</td>
</tr>
<tr>
<td>- A paradox::ParamSet which stores meta-information about available hyperparameters, and also stores hyperparameter settings.</td>
</tr>
<tr>
<td>- Meta-information about the requirements and capabilities of the learner.</td>
</tr>
<tr>
<td>- The fitted model stored in field <code>$model</code>, available after calling <code>$train()</code>.</td>
</tr>
</tbody>
</table>

Predefined learners are stored in the dictionary mlr_learners, e.g. `classif.rpart` or `regr.rpart`. More classification and regression learners are implemented in the add-on package mlr3learners. Learners for survival analysis (or more general, for probabilistic regression) can be found in mlr3proba. Unsupervised cluster algorithms are implemented in mlr3cluster. The dictionary mlr_learners gets automatically populated with the new learners as soon as the respective packages are loaded.
More (experimental) learners can be found in the GitHub repository: https://github.com/mlr-org/mlr3extralearners. A guide on how to extend mlr3 with custom learners can be found in the mlr3book.

To combine the learner with preprocessing operations like factor encoding, mlr3pipelines is recommended. Hyperparameters stored in the param_set can be tuned with mlr3tuning.

Optional Extractors

Specific learner implementations are free to implement additional getters to ease the access of certain parts of the model in the inherited subclasses.

For the following operations, extractors are standardized:

- **importance(...)**: Returns the feature importance score as numeric vector. The higher the score, the more important the variable. The returned vector is named with feature names and sorted in decreasing order. Note that the model might omit features it has not used at all. The learner must be tagged with property ”importance”. To filter variables using the importance scores, see package mlr3filters.
- **selected_features(...)**: Returns a subset of selected features as character(). The learner must be tagged with property ”selected_features”.
- **oob_error(...)**: Returns the out-of-bag error of the model as numeric(1). The learner must be tagged with property ”oob_error”.
- **loglik(...)**: Extracts the log-likelihood (c.f. stats::logLik()). This can be used in measures like mlr_measures_aic or mlr_measures_bic.

Setting Hyperparameters

All information about hyperparameters is stored in the slot param_set which is a paradox::ParamSet. The printer gives an overview about the ids of available hyperparameters, their storage type, lower and upper bounds, possible levels (for factors), default values and assigned values. To set hyperparameters, assign a named list to the subslot values:

```r
lrn = lrn("classif.rpart")
lrn$param_set$values = list(minsplit = 3, cp = 0.01)
```

Note that this operation replaces all previously set hyperparameter values. If you only intend to change one specific hyperparameter value and leave the others as-is, you can use the helper function mlr3misc::insert_named():

```r
lrn$param_set$values = mlr3misc::insert_named(lrn$param_set$values, list(cp = 0.001))
```

If the learner has additional hyperparameters which are not encoded in the ParamSet, you can easily extend the learner. Here, we add a factor hyperparameter with id ”foo” and possible levels ”a” and ”b”:

```r
lrn$param_set$add(paradox::ParamFct$new("foo", levels = c("a", "b")))
```
**Public fields**

- **id** (character(1))
  - Identifier of the object. Used in tables, plot and text output.

- **label** (character(1))
  - Label for this object. Can be used in tables, plot and text output instead of the ID.

- **state** (NULL | named list())
  - Current (internal) state of the learner. Contains all information gathered during `train()` and `predict()`. It is not recommended to access elements from state directly. This is an internal data structure which may change in the future.

- **task_type** (character(1))
  - Task type, e.g. "classif" or "regr".
  - For a complete list of possible task types (depending on the loaded packages), see `mlr_reflections$task_types$type`.

- **predict_types** (named list())
  - Stores the possible predict types the learner is capable of. A complete list of candidate predict types, grouped by task type, is stored in `mlr_reflections$learner_predict_types`.

- **feature_types** (character())
  - Stores the feature types the learner can handle, e.g. "logical", "numeric", or "factor". A complete list of candidate feature types, grouped by task type, is stored in `mlr_reflections$task_feature_types`.

- **properties** (character())
  - Stores a set of properties/capabilities the learner has. A complete list of candidate properties, grouped by task type, is stored in `mlr_reflections$learner_properties`.

- **data_formats** (character())
  - Supported data format, e.g. "data.table" or "Matrix".

- **packages** (character(1))
  - Set of required packages. These packages are loaded, but not attached.

- **predict_sets** (character())
  - During `resample()`/`benchmark()`, a Learner can predict on multiple sets. Per default, a learner only predicts observations in the test set (`predict_sets = "test"`). To change this behavior, set `predict_sets` to a non-empty subset of {"train", "test", "holdout"}. Each set yields a separate `Prediction` object. Those can be combined via getters in `ResampleResult/BenchmarkResult`, or `Measures` can be configured to operate on specific subsets of the calculated prediction sets.

- **parallel_predict** (logical(1))
  - If set to TRUE, use `future` to calculate predictions in parallel (default: FALSE). The row ids of the task will be split into `future::nbrOfWorkers()` chunks, and predictions are evaluated according to the active `future::plan()`. This currently only works for methods `Learner$predict()` and `Learner$predict_newdata()`, and has no effect during `resample()` or `benchmark()` where you have other means to parallelize.

- **timeout** (named numeric(2))
  - Timeout for the learner's train and predict steps, in seconds. This works differently for different encapsulation methods, see `mlrmisc::encapsulate()`. Default is c(train = Inf, predict = Inf). Also see the section on error handling the mlr3book: `https://mlr3book.mlorg.com/chapters/chapter10/advanced_technical_aspects_of_mlr3.html#sec-error-handling`.

- **man** (character(1))
  - String in the format [pkg]:[:topic] pointing to a manual page for this object. Defaults to NA, but can be set by child classes.
Active bindings

model (any)
   The fitted model. Only available after $\text{train}()$ has been called.

timings (named numeric(2))
   Elapsed time in seconds for the steps "train" and "predict". Measured via \texttt{mlr3misc::encapsulate()}.

log (\texttt{data.table::data.table()})
   Returns the output (including warning and errors) as table with columns
   • "stage" ("train" or "predict"),
   • "class" ("output", "warning", or "error"), and
   • "msg" (character()).

warnings (character())
   Logged warnings as vector.

erors (character())
   Logged errors as vector.

hash (character(1))
   Hash (unique identifier) for this object.

phash (character(1))
   Hash (unique identifier) for this partial object, excluding some components which are varied systematically during tuning (parameter values) or feature selection (feature names).

predict_type (character(1))
   Stores the currently active predict type, e.g. "response". Must be an element of $\text{predict\_types}$.

param_set (\texttt{paradox::ParamSet})
   Set of hyperparameters.

encapsulate (named character())
   Controls how to execute the code in internal train and predict methods. Must be a named character vector with names "train" and "predict". Possible values are "none", "try", "evaluate" (requires package \texttt{evaluate}) and "callr" (requires package \texttt{callr}). See \texttt{mlr3misc::encapsulate()} for more details.

fallback (\texttt{Learner})
   Learner which is fitted to impute predictions in case that either the model fitting or the prediction of the top learner is not successful. Requires encapsulation, otherwise errors are not caught and the execution is terminated before the fallback learner kicks in. If you have not set encapsulation manually before, setting the fallback learner automatically activates encapsulation using the \texttt{evaluate} package. Also see the section on error handling the mlr3book: \url{https://mlr3book.mlr-org.com/chapters/chapter10/advanced_technical_aspects_of_mlr3.html#sec-error-handling}

hotstart_stack (\texttt{HotstartStack})
   Stores HotstartStack.

Methods

Public methods:
• \texttt{Learner$new()}  
• \texttt{Learner$format()}
Method `new()`: Creates a new instance of this R6 class.

Note that this object is typically constructed via a derived classes, e.g. `LearnerClassif` or `LearnerRegr`.

**Usage:**

```r
Learner$new(
  id,
  task_type,
  param_set = ps(),
  predict_types = character(),
  feature_types = character(),
  properties = character(),
  data_formats = "data.table",
  packages = character(),
  label = NA_character_,
  man = NA_character_
)
```

**Arguments:**

- `id` (character(1))
  - Identifier for the new instance.
- `task_type` (character(1))
  - Type of task, e.g. "regr" or "classif". Must be an element of `mlr_reflections$task_types$type`.
- `param_set` (paradox::ParamSet)
  - Set of hyperparameters.
- `predict_types` (character())
  - Supported predict types. Must be a subset of `mlr_reflections$learner_predict_types`.
- `feature_types` (character())
  - Feature types the learner operates on. Must be a subset of `mlr_reflections$task_feature_types`.
- `properties` (character())
  - Set of properties of the Learner. Must be a subset of `mlr_reflections$learner_properties`.

The following properties are currently standardized and understood by learners in `mlr3`:

- "missings": The learner can handle missing values in the data.
- "weights": The learner supports observation weights.
- "importance": The learner supports extraction of importance scores, i.e. comes with an `$importance()` extractor function (see section on optional extractors in Learner).
- "selected_features": The learner supports extraction of the set of selected features, i.e. comes with a `$selected_features()` extractor function (see section on optional extractors in Learner).
Learner

- "oob_error": The learner supports extraction of estimated out of bag error, i.e. comes with a oob_error() extractor function (see section on optional extractors in Learner).

data_formats (character())
Set of supported data formats which can be processed during $train() and $predict(), e.g. "data.table".

packages (character())
Set of required packages. A warning is signaled by the constructor if at least one of the packages is not installed, but loaded (not attached) later on-demand via requireNamespace().

label (character(1))
Label for the new instance.

man (character(1))
String in the format [pkg]::[topic] pointing to a manual page for this object. The referenced help package can be opened via method $help().

Method format(): Helper for print outputs.

Usage:
Learner$format(...)  
Arguments:
... (ignored).

Method print(): Printer.

Usage:
Learner/print(...)  
Arguments:
... (ignored).

Method help(): Opens the corresponding help page referenced by field $man.

Usage:
Learner/help()  

Method train(): Train the learner on a set of observations of the provided task. Mutates the learner by reference, i.e. stores the model alongside other information in field $state.

Usage:
Learner/train(task, row_ids = NULL)  
Arguments:
task (Task).  
row_ids (integer())
Vector of training indices as subset of task$row_ids. For a simple split into training and test set, see partition().

Returns: Returns the object itself, but modified by reference. You need to explicitly $clone() the object beforehand if you want to keep the object in its previous state.

Method predict(): Uses the information stored during $train() in $state to create a new Prediction for a set of observations of the provided task.
Usage:
Learner$predict(task, row_ids = NULL)

Arguments:
task (Task).
row_ids (integer())
Vector of test indices as subset of task$row_ids. For a simple split into training and test
set, see partition().

Returns: Prediction.

Method predict_newdata(): Uses the model fitted during $train() to create a new Prediction
based on the new data in newdata. Object task is the task used during $train() and required for
conversion of newdata. If the learner's $train() method has been called, there is a (size reduced)
version of the training task stored in the learner. If the learner has been fitted via resample() or
benchmark(), you need to pass the corresponding task stored in the ResampleResult or Bench-
markResult, respectively.

Usage:
Learner$predict_newdata(newdata, task = NULL)

Arguments:
newdata (any object supported by as_data_backend())
New data to predict on. All data formats convertible by as_data_backend() are supported,
e.g. data.frame() or DataBackend. If a DataBackend is provided as newdata, the row ids
are preserved, otherwise they are set to to the sequence 1:nrow(newdata).
task (Task).

Returns: Prediction.

Method reset(): Reset the learner, i.e. un-train by resetting the state.

Usage:
Learner$reset()

Returns: Returns the object itself, but modified by reference. You need to explicitly $clone()
the object beforehand if you want to keeps the object in its previous state.

Method base_learner(): Extracts the base learner from nested learner objects like GraphLearner
in mlr3pipelines or AutoTuner in mlr3tuning. Returns the Learner itself for regular learners.

Usage:
Learner$base_learner(recursive = Inf)

Arguments:
recursive (integer(1))
Depth of recursion for multiple nested objects.

Returns: Learner.

Method clone(): The objects of this class are cloneable with this method.

Usage:
Learner$clone(deep = FALSE)

Arguments:
deep Whether to make a deep clone.
See Also

- Package mlr3learners for a solid collection of essential learners.
- Package mlr3extralearners for more learners.
- Dictionary of Learners: mlr_learners
- as.data.table(mlr_learners) for a table of available Learners in the running session (depending on the loaded packages).
- mlr3pipelines to combine learners with pre- and postprocessing steps.
- Package mlr3viz for some generic visualizations.
- Extension packages for additional task types:
  - mlr3proba for probabilistic supervised regression and survival analysis.
  - mlr3cluster for unsupervised clustering.
- mlr3tuning for tuning of hyperparameters, mlr3tuningspaces for established default tuning spaces.

---

LearnerClassif | Classification Learner

Description

This Learner specializes Learner for classification problems:

- task_type is set to "classif".
- Creates Predictions of class PredictionClassif.
- Possible values for predict_types are:
  - "response": Predicts a class label for each observation in the test set.
  - "prob": Predicts the posterior probability for each class for each observation in the test set.
- Additional learner properties include:
  - "twoclass": The learner works on binary classification problems.
  - "multiclass": The learner works on multiclass classification problems.

Predefined learners can be found in the dictionary mlr_learners. Essential classification learners can be found in this dictionary after loading mlr3learners. Additional learners are implement in the Github package https://github.com/mlr-org/mlr3extralearners.

Super class

mlr3::Learner -> LearnerClassif
LearnerClassif

Methods

Public methods:

- LearnerClassif$new()
- LearnerClassif$clone()

Method new(): Creates a new instance of this R6 class.

Usage:
LearnerClassif$new(
  id,
  param_set = ps(),
  predict_types = "response",
  feature_types = character(),
  properties = character(),
  data_formats = "data.table",
  packages = character(),
  label = NA_character_,
  man = NA_character_
)

Arguments:

id (character(1))
  Identifier for the new instance.

param_set (paradox::ParamSet)
  Set of hyperparameters.

predict_types (character())
  Supported predict types. Must be a subset of mlr_reflections$learner_predict_types.

feature_types (character())
  Feature types the learner operates on. Must be a subset of mlr_reflections$task_feature_types.

properties (character())
  Set of properties of the Learner. Must be a subset of mlr_reflections$learner_properties.
  The following properties are currently standardized and understood by learners in mlr3:
  • "missings": The learner can handle missing values in the data.
  • "weights": The learner supports observation weights.
  • "importance": The learner supports extraction of importance scores, i.e. comes with an $importance() extractor function (see section on optional extractors in Learner).
  • "selected_features": The learner supports extraction of the set of selected features, i.e. comes with a $selected_features() extractor function (see section on optional extractors in Learner).
  • "oob_error": The learner supports extraction of estimated out of bag error, i.e. comes with a oob_error() extractor function (see section on optional extractors in Learner).

data_formats (character())
  Set of supported data formats which can be processed during $train() and $predict(), e.g. "data.table".

packages (character())
  Set of required packages. A warning is signaled by the constructor if at least one of the packages is not installed, but loaded (not attached) later on-demand via requireNamespace().
LearnerClassif

label (character(1))
Label for the new instance.

man (character(1))
String in the format [pkg]:[topic] pointing to a manual page for this object. The referenced help package can be opened via method $help().

Method clone(): The objects of this class are cloneable with this method.
Usage:
LearnerClassif$clone(deep = FALSE)
Arguments:
deep Whether to make a deep clone.

See Also
- Package mlr3learners for a solid collection of essential learners.
- Package mlr3extralearners for more learners.
- Dictionary of Learners: mlr_learners
- as.data.table(mlr_learners) for a table of available Learners in the running session (depending on the loaded packages).
- mlr3pipelines to combine learners with pre- and postprocessing steps.
- Package mlr3viz for some generic visualizations.
- Extension packages for additional task types:
  - mlr3proba for probabilistic supervised regression and survival analysis.
  - mlr3cluster for unsupervised clustering.
- mlr3tuning for tuning of hyperparameters, mlr3tuningspaces for established default tuning spaces.

Examples

# get all classification learners from mlr_learners:
lrns = mlr_learners$mget(mlr_learners$keys("classif"))
names(lrns)

# get a specific learner from mlr_learners:
ln = lrn("classif.rpart")
print(ln)

# train the learner:
task = tsk("penguins")
lnr$train(task, 1:200)

# predict on new observations:
lnr$predict(task, 201:344)$confusion
Description

This Learner specializes Learner for regression problems:

- task_type is set to "regr".
- Creates Predictions of class PredictionRegr.
- Possible values for predict_types are:
  - "response": Predicts a numeric response for each observation in the test set.
  - "se": Predicts the standard error for each value of response for each observation in the test set.
  - "distr": Probability distribution as VectorDistribution object (requires package distr6, available via repository https://raphaels1.r-universe.dev).

Predefined learners can be found in the dictionary mlr_learners. Essential regression learners can be found in this dictionary after loading mlr3learners. Additional learners are implement in the Github package https://github.com/mlr-org/mlr3extralearners.

Super class

mlr3::Learner -> LearnerRegr

Methods

Public methods:

- LearnerRegr$new()
- LearnerRegr$clone()

Method new(): Creates a new instance of this R6 class.

Usage:
LearnerRegr$new(
  id,
  param_set = ps(),
  predict_types = "response",
  feature_types = character(),
  properties = character(),
  data_formats = "data.table",
  packages = character(),
  label = NA_character_,
  man = NA_character_
)

Arguments:
id (character(1))
  Identifier for the new instance.
param_set (paradox::ParamSet)
  Set of hyperparameters.
predict_types (character())
  Supported predict types. Must be a subset of \texttt{mlr_reflections$learner_predict_types}.
feature_types (character())
  Feature types the learner operates on. Must be a subset of \texttt{mlr_reflections$task_feature_types}.
properties (character())
  Set of properties of the Learner. Must be a subset of \texttt{mlr_reflections$learner_properties}.
  The following properties are currently standardized and understood by learners in \texttt{mlr3}:
  • "missings": The learner can handle missing values in the data.
  • "weights": The learner supports observation weights.
  • "importance": The learner supports extraction of importance scores, i.e. comes with an \texttt{$importance()} extractor function (see section on optional extractors in \texttt{Learner}).
  • "selected_features": The learner supports extraction of the set of selected features, i.e. comes with a \texttt{$selected_features()} extractor function (see section on optional extractors in \texttt{Learner}).
  • "oob_error": The learner supports extraction of estimated out of bag error, i.e. comes with a \texttt{oob_error()} extractor function (see section on optional extractors in \texttt{Learner}).
data_formats (character())
  Set of supported data formats which can be processed during \texttt{$train()} and \texttt{$predict()}, e.g. "data.table".
packages (character())
  Set of required packages. A warning is signaled by the constructor if at least one of the packages is not installed, but loaded (not attached) later on-demand via \texttt{requireNamespace()}. 
label (character(1))
  Label for the new instance.
man (character(1))
  String in the format \texttt{[pkg]: [topic]} pointing to a manual page for this object. The referenced help package can be opened via method \texttt{$help()}. 

\textbf{Method} \texttt{clone()}: The objects of this class are cloneable with this method.

\textit{Usage:}
\texttt{LearnerRegr$clone(deep = FALSE)}

\textit{Arguments:}

\texttt{deep} Whether to make a deep clone.

\textbf{See Also}

### Examples

```r
# get all regression learners from mlr_learners:
lrns = mlr_learners$mget(mlr_learners$keys("regr"))
names(lrns)

# get a specific learner from mlr_learners:
mlr_learners$get("regr.rpart")
lrn("classif.featureless")
```

### Measure

<table>
<thead>
<tr>
<th>Measure</th>
<th>Measure Class</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Description

This is the abstract base class for measures like `MeasureClassif` and `MeasureRegr`.

Measures are classes tailored around two functions doing the work:

1. A function `$score()` which quantifies the performance by comparing the truth and predictions.

2. A function `$aggregator()` which combines multiple performance scores returned by `$score()` to a single numeric value.

In addition to these two functions, meta-information about the performance measure is stored.

Predefined measures are stored in the dictionary `mlr_measures`, e.g. `classif.auc` or `time_train`. Many of the measures in `mlr3` are implemented in `mlr3measures` as ordinary functions.

A guide on how to extend `mlr3` with custom measures can be found in the `mlr3book`. 
Public fields

id (character(1))
Identifier of the object. Used in tables, plot and text output.

label (character(1))
Label for this object. Can be used in tables, plot and text output instead of the ID.

task_type (character(1))
Task type, e.g. "classif" or "regr". For a complete list of possible task types (depending on the loaded packages), see `mlr_reflections$task_types$type`.

param_set (paradox::ParamSet)
Set of hyperparameters.

predict_type (character(1))
Required predict type of the Learner.

predict_sets (character())
During `resample()`/`benchmark()`, a Learner can predict on multiple sets. Per default, a learner only predicts observations in the test set (predict_sets == "test"). To change this behavior, set predict_sets to a non-empty subset of ("train", "test", "holdout"). Each set yields a separate Prediction object. Those can be combined via getters in `ResampleResult/BenchmarkResult`, or Measures can be configured to operate on specific subsets of the calculated prediction sets.

check_prerequisites (character(1))
How to proceed if one of the following prerequisites is not met:

• wrong predict type (e.g., probabilities required, but only labels available).
• wrong predict set (e.g., learner predicted on training set, but predictions of test set required).
• task properties not satisfied (e.g., binary classification measure on multiclass task).

Possible values are "ignore" (just return NaN) and "warn" (default, raise a warning before returning NaN).

task_properties (character())
Required properties of the Task.

range (numeric(2))
Lower and upper bound of possible performance scores.

properties (character())
Properties of this measure.

minimize (logical(1))
If TRUE, good predictions correspond to small values of performance scores.

packages (character(1))
Set of required packages. These packages are loaded, but not attached.

man (character(1))
String in the format [pkg]:[topic] pointing to a manual page for this object. Defaults to NA, but can be set by child classes.
Active bindings

hash (character(1))
- Hash (unique identifier) for this object.

average (character(1))
- Method for aggregation:
  - "micro": All predictions from multiple resampling iterations are first combined into a single `Prediction` object. Next, the scoring function of the measure is applied on this combined object, yielding a single numeric score.
  - "macro": The scoring function is applied on the `Prediction` object of each resampling iterations, each yielding a single numeric score. Next, the scores are combined with the `aggregator` function to a single numerical score.
  - "custom": The measure comes with a custom aggregation method which directly operates on a `ResampleResult`.

aggregator (function())
- Function to aggregate scores computed on different resampling iterations.

Methods

Public methods:

- `Measure$new()`
- `Measure$format()`
- `Measure$print()`
- `Measure$help()`
- `Measure$score()`
- `Measure$aggregate()`
- `Measure$clone()`

Method `new()`:
- Creates a new instance of this R6 class.

Note that this object is typically constructed via a derived classes, e.g. `MeasureClassif` or `MeasureRegr`.

Usage:
- `Measure$new(id, task_type = NA, param_set = ps(), range = c(-Inf, Inf), minimize = NA, average = "macro", aggregator = NULL, properties = character(), predict_type = "response", predict_sets = "test", task_properties = character(), packages = character(), label = NA_character_,
...)`
Measure

\[ \text{man} = \text{NA}\_\text{character}\_ \]

Arguments:

\text{id} (\text{character}(1))
- Identifier for the new instance.

\text{task\_type} (\text{character}(1))
- Type of task, e.g. "regr" or "classif". Must be an element of \text{mlr\_reflections}\$\text{task\_types}\$\text{type}.

\text{param\_set} (\text{paradox}\_\text{::ParamSet})
- Set of hyperparameters.

\text{range} (\text{numeric}(2))
- Feasible range for this measure as \text{c(lower\_bound, upper\_bound)}. Both bounds may be infinite.

\text{minimize} (\text{logical}(1))
- Set to \text{TRUE} if good predictions correspond to small values, and to \text{FALSE} if good predictions correspond to large values. If set to \text{NA} (default), tuning this measure is not possible.

\text{average} (\text{character}(1))
- How to average multiple \text{Predictions} from a \text{ResampleResult}.
  - The default, "macro", calculates the individual performances scores for each \text{Prediction} and then uses the function defined in $\text{aggregator}$ to average them to a single number.
  - If set to "micro", the individual \text{Prediction} objects are first combined into a single new \text{Prediction} object which is then used to assess the performance. The function in $\text{aggregator}$ is not used in this case.

\text{aggregator} (\text{function}())
- Function to aggregate over multiple iterations. The role of this function depends on the value of field "average":
  - "macro": A numeric vector of scores (one per iteration) is passed. The aggregate function defaults to \text{mean()} in this case.
  - "micro": The \text{aggregator} function is not used. Instead, predictions from multiple iterations are first combined and then scored in one go.
  - "custom": A \text{ResampleResult} is passed to the aggregate function.

\text{properties} (\text{character}())
- Properties of the measure. Must be a subset of \text{mlr\_reflections}\$\text{measure\_properties}$. Supported by \text{mlr3}:
  - "requires\_task" (requires the complete \text{Task}),
  - "requires\_learner" (requires the trained \text{Learner}),
  - "requires\_model" (requires the trained \text{Learner}, including the fitted model),
  - "requires\_train\_set" (requires the training indices from the \text{Resampling}), and
  - "na\_score" (the measure is expected to occasionally return \text{NA} or NaN).

\text{predict\_type} (\text{character}(1))
- Required predict type of the \text{Learner}. Possible values are stored in \text{mlr\_reflections}\$\text{learner\_predict\_types}.

\text{predict\_sets} (\text{character}())
- Prediction sets to operate on, used in \text{aggregate()} to extract the matching predict\_sets from the \text{ResampleResult}. Multiple predict sets are calculated by the respective \text{Learner} during \text{resample()}/\text{benchmark()}. Must be a non-empty subset of \{"train", "test", "holdout"\}. If multiple sets are provided, these are first combined to a single prediction object. Default is "test".
Measure

task_properties (character())
   Required task properties, see Task.
packages (character())
   Set of required packages. A warning is signaled by the constructor if at least one of the packages is not installed, but loaded (not attached) later on-demand via requireNamespace().
label (character(1))
   Label for the new instance.
man (character(1))
   String in the format [pkg]::[topic] pointing to a manual page for this object. The referenced help package can be opened via method $help().

Method format(): Helper for print outputs.
   Usage:
   Measure$format(...)
   Arguments:
   ... (ignored).

Method print(): Printer.
   Usage:
   Measure$print(...)
   Arguments:
   ... (ignored).

Method help(): Opens the corresponding help page referenced by field $man.
   Usage:
   Measure$help()

Method score(): Takes a Prediction (or a list of Prediction objects named with valid predict_sets) and calculates a numeric score. If the measure if flagged with the properties "requires_task", "requires_learner", "requires_model" or "requires_train_set", you must additionally pass the respective Task, the (trained) Learner or the training set indices. This is handled internally during resample() / benchmark().
   Usage:
   Measure$score(prediction, task = NULL, learner = NULL, train_set = NULL)
   Arguments:
   prediction (Prediction | named list of Prediction).
task (Task).
learner (Learner).
train_set (integer()).
Returns: numeric(1).

Method aggregate(): Aggregates multiple performance scores into a single score, e.g. by using the aggregator function of the measure.
   Usage:
Measure\$aggregate(rr)

*Arguments:*

*rr* ResampleResult.

*Returns:* numeric(1).

**Method** `clone()`: The objects of this class are cloneable with this method.

*Usage:*

Measure\$clone(deep = FALSE)

*Arguments:*

deep Whether to make a deep clone.

---

**Description**

This measure specializes `Measure` for classification problems:

- `task_type` is set to "classif".
- Possible values for `predict_type` are "response" and "prob".

Predefined measures can be found in the dictionary `mlr_measures`. The default measure for classification is `classif.ce`.

**Super class**

`mlr3::Measure` -> `MeasureClassif`
Methods

Public methods:

• `MeasureClassif$new()`
• `MeasureClassif$clone()`

Method `new()`: Creates a new instance of this R6 class.

Usage:
```
MeasureClassif$new(
  id,
  param_set = ps(),
  range,
  minimize = NA,
  average = "macro",
  aggregator = NULL,
  properties = character(),
  predict_type = "response",
  predict_sets = "test",
  task_properties = character(),
  packages = character(),
  label = NA_character_,
  man = NA_character_
)
```

Arguments:

id (character(1))
  Identifier for the new instance.

param_set (paradox::ParamSet)
  Set of hyperparameters.

range (numeric(2))
  Feasible range for this measure as c(lower_bound, upper_bound). Both bounds may be
  infinite.

minimize (logical(1))
  Set to TRUE if good predictions correspond to small values, and to FALSE if good predictions
  correspond to large values. If set to NA (default), tuning this measure is not possible.

average (character(1))
  How to average multiple Predictions from a ResampleResult.
  The default, "macro", calculates the individual performances scores for each Prediction and
  then uses the function defined in $aggregator to average them to a single number.
  If set to "micro", the individual Prediction objects are first combined into a single new Prediction
  object which is then used to assess the performance. The function in $aggregator
  is not used in this case.

aggregator (function())
  Function to aggregate over multiple iterations. The role of this function depends on the
  value of field "average":
  • "macro": A numeric vector of scores (one per iteration) is passed. The aggregate function
defaults to mean() in this case.
• "micro": The aggregator function is not used. Instead, predictions from multiple iterations are first combined and then scored in one go.
• "custom": A ResampleResult is passed to the aggregate function.

properties (character())
Properties of the measure. Must be a subset of mlr_reflections$measure_properties. Supported by mlr3:
• "requires_task" (requires the complete Task),
• "requires_learner" (requires the trained Learner),
• "requires_model" (requires the trained Learner, including the fitted model),
• "requires_train_set" (requires the training indices from the Resampling), and
• "na_score" (the measure is expected to occasionally return NA or NaN).

predict_type (character(1))
Required predict type of the Learner. Possible values are stored in mlr_reflections$learner_predict_types.

predict_sets (character())
Prediction sets to operate on, used in aggregate() to extract the matching predict_sets from the ResampleResult. Multiple predict sets are calculated by the respective Learner during resample()/benchmark(). Must be a non-empty subset of {"train", "test", "holdout"}. If multiple sets are provided, these are first combined to a single prediction object. Default is "test".

task_properties (character())
Required task properties, see Task.

packages (character())
Set of required packages. A warning is signaled by the constructor if at least one of the packages is not installed, but loaded (not attached) later on-demand via requireNamespace().

label (character(1))
Label for the new instance.

man (character(1))
String in the format [pkg]:[topic] pointing to a manual page for this object. The referenced help package can be opened via method $help().

Method clone(): The objects of this class are cloneable with this method.

Usage:
MeasureClassif$clone(deep = FALSE)

Arguments:
depth Whether to make a deep clone.

See Also
• Package mlr3measures for the scoring functions. Dictionary of Measures: mlr_measures
• Package mlr3proba for probabilistic supervised regression and survival analysis.
measure_test

– `mlr3cluster` for unsupervised clustering.

<table>
<thead>
<tr>
<th>MeasureRegr</th>
<th>Regression Measure</th>
</tr>
</thead>
</table>

Description

This measure specializes `Measure` for regression problems:

- `task_type` is set to "regr".
- Possible values for `predict_type` are "response", "se" and "distr".

Predefined measures can be found in the dictionary `mlr_measures`. The default measure for regression is `regr.mse`.

Super class

`mlr3::Measure` -> `MeasureRegr`

Methods

Public methods:

- `MeasureRegr$new()`
- `MeasureRegr$clone()`

Method `new()`: Creates a new instance of this R6 class.

Usage:

```r
MeasureRegr$new(
  id,
  param_set = ps(),
  range,
  minimize = NA,
  average = "macro",
  aggregator = NULL,
  properties = character(),
  predict_type = "response",
  predict_sets = "test",
  task_properties = character(),
  packages = character(),
  label = NA_character_,
  man = NA_character_
)
```

Arguments:
id (character(1))
Identifier for the new instance.

param_set (paradox::ParamSet)
Set of hyperparameters.

range (numeric(2))
Feasible range for this measure as c(lower_bound, upper_bound). Both bounds may be infinite.

minimize (logical(1))
Set to TRUE if good predictions correspond to small values, and to FALSE if good predictions correspond to large values. If set to NA (default), tuning this measure is not possible.

average (character(1))
How to average multiple Predictions from a ResampleResult.
The default, "macro", calculates the individual performances scores for each Prediction and then uses the function defined in $aggregator to average them to a single number. If set to "micro", the individual Prediction objects are first combined into a single new Prediction object which is then used to assess the performance. The function in $aggregator is not used in this case.

aggregator (function())
Function to aggregate over multiple iterations. The role of this function depends on the value of field "average":
• "macro": A numeric vector of scores (one per iteration) is passed. The aggregate function defaults to mean() in this case.
• "micro": The aggregator function is not used. Instead, predictions from multiple iterations are first combined and then scored in one go.
• "custom": A ResampleResult is passed to the aggregate function.

properties (character())
Properties of the measure. Must be a subset of mlr_reflections$measure_properties. Supported by mlr3:
• "requires_task" (requires the complete Task),
• "requires_learner" (requires the trained Learner),
• "requires_model" (requires the trained Learner, including the fitted model),
• "requires_train_set" (requires the training indices from the Resampling), and
• "na_score" (the measure is expected to occasionally return NA or NaN).

predict_type (character(1))
Required predict type of the Learner. Possible values are stored in mlr_reflections$Learner_predict_types.

predict_sets (character())
Prediction sets to operate on, used in aggregate() to extract the matching predict_sets from the ResampleResult. Multiple predict sets are calculated by the respective Learner during resample()/benchmark(). Must be a non-empty subset of {"train", "test", "holdout"}. If multiple sets are provided, these are first combined to a single prediction object. Default is "test".

task_properties (character())
Required task properties, see Task.

packages (character())
Set of required packages. A warning is signaled by the constructor if at least one of the packages is not installed, but loaded (not attached) later on-demand via requireNamespace().
MeasureSimilarity

label (character(1))
   Label for the new instance.

man (character(1))
   String in the format [pkg]:[topic] pointing to a manual page for this object. The referenced help package can be opened via method $help().

Method clone(): The objects of this class are cloneable with this method.

Usage:
MeasureRegr$clone(deep = FALSE)

Arguments:
deept Whether to make a deep clone.

MeasureSimilarity Similarity Measure

Description

This measure specializes Measure for measures quantifying the similarity of sets of selected features. To calculate similarity measures, the Learner must have the property "selected_features".

- task_type is set to NA_character_.
- average is set to "custom".

Predefined measures can be found in the dictionary mlr_measures, prefixed with "sim."

Super class

mlr3::Measure -> MeasureSimilarity
Methods

Public methods:

- `MeasureSimilarity$new()`
- `MeasureSimilarity$clone()`

Method `new()`: Creates a new instance of this R6 class.

Usage:

```r
MeasureSimilarity$new(
  id,
  param_set = ps(),
  range,
  minimize = NA,
  average = "macro",
  aggregator = NULL,
  properties = character(),
  predict_type = NA_character_,
  predict_sets = "test",
  task_properties = character(),
  packages = character(),
  label = NA_character_,
  man = NA_character_
)
```

Arguments:

- `id` (character(1))
  Identifier for the new instance.

- `param_set` (paradox::ParamSet)
  Set of hyperparameters.

- `range` (numeric(2))
  Feasible range for this measure as c(lower_bound, upper_bound). Both bounds may be infinite.

- `minimize` (logical(1))
  Set to `TRUE` if good predictions correspond to small values, and to `FALSE` if good predictions correspond to large values. If set to `NA` (default), tuning this measure is not possible.

- `average` (character(1))
  How to average multiple `Predictions` from a `ResampleResult`.
  The default, "macro", calculates the individual performances scores for each `Prediction` and then uses the function defined in $aggregator to average them to a single number.
  If set to "micro", the individual `Prediction` objects are first combined into a single new `Prediction` object which is then used to assess the performance. The function in $aggregator is not used in this case.

- `aggregator` (function())
  Function to aggregate over multiple iterations. The role of this function depends on the value of field "average":
  
    - "macro": A numeric vector of scores (one per iteration) is passed. The aggregate function defaults to `mean()` in this case.
• "micro": The aggregator function is not used. Instead, predictions from multiple iterations are first combined and then scored in one go.
• "custom": A ResampleResult is passed to the aggregate function.

properties (character())
Properties of the measure. Must be a subset of mlr_reflections$measure_properties. Supported by mlr3:
• "requires_task" (requires the complete Task),
• "requires_learner" (requires the trained Learner),
• "requires_model" (requires the trained Learner, including the fitted model),
• "requires_train_set" (requires the training indices from the Resampling), and
• "na_score" (the measure is expected to occasionally return NA or NaN).

predict_type (character(1))
Required predict type of the Learner. Possible values are stored in mlr_reflections$learner_predict_types.

predict_sets (character())
Prediction sets to operate on, used in aggregate() to extract the matching predict_sets from the ResampleResult. Multiple predict sets are calculated by the respective Learner during resample() / benchmark(). Must be a non-empty subset of {"train", "test", "holdout"}. If multiple sets are provided, these are first combined to a single prediction object. Default is "test".

task_properties (character())
Required task properties, see Task.

packages (character())
Set of required packages. A warning is signaled by the constructor if at least one of the packages is not installed, but loaded (not attached) later on-demand via requireNamespace().

label (character(1))
Label for the new instance.

man (character(1))
String in the format [pkg][:[topic] pointing to a manual page for this object. The referenced help package can be opened via method $help().

Method clone(): The objects of this class are cloneable with this method.

Usage:
MeasureSimilarity$clone(deep = FALSE)

Arguments:
depth Whether to make a deep clone.

mlr_learners

Dictionary of Learners

Description

A simple mlr3misc::Dictionary storing objects of class Learner. Each learner has an associated help page, see mlr_learners_[id].

This dictionary can get populated with additional learners by add-on packages. For an opinionated set of solid classification and regression learners, install and load the mlr3learners package. More learners are connected via https://github.com/mlr-org/mlr3extralearners.

For a more convenient way to retrieve and construct learners, see lrn()/lrns().

Format

R6::R6Class object inheriting from mlr3misc::Dictionary.

Methods

See mlr3misc::Dictionary.

S3 methods

• as.data.table(dict, ..., objects = FALSE)
  mlr3misc::Dictionary -> data.table::data.table()
  Returns a data.table::data.table() with fields "key", "label", "task_type", "feature_types", "packages", "properties", and "predict_types" as columns. If objects is set to TRUE, the constructed objects are returned in the list column named object.
mlr_learners_classif.debug

See Also
Sugar functions: lrn(), lrns()
Extension Packages: mlr3learners
Other Dictionary: mlr_measures, mlr_resamplings, mlr_task_generators, mlr_tasks

Examples
as.data.table(mlr_learners)
mlr_learners$get("classif.featureless")
lrn("classif.rpart")

mlr_learners_classif.debug
Classification Learner for Debugging

Description
A simple LearnerClassif used primarily in the unit tests and for debugging purposes. If no hyperparameter is set, it simply constantly predicts a randomly selected label. The following hyperparameters trigger the following actions:

**error_predict**: Probability to raise an exception during predict.
**error_train**: Probability to raises an exception during train.
**message_predict**: Probability to output a message during predict.
**message_train**: Probability to output a message during train.
**predict_missing**: Ratio of predictions which will be NA.
**predict_missing_type**: To to encode missingness. “na” will insert NA values, “omit” will just return fewer predictions than requested.
**save_tasks**: Saves input task in model slot during training and prediction.
**segfault_predict**: Probability to provokes a segfault during predict.
**segfault_train**: Probability to provokes a segfault during train.
**sleep_train**: Function returning a single number determining how many seconds to sleep during $train()$.
**sleep_predict**: Function returning a single number determining how many seconds to sleep during $predict()$.
**threads**: Number of threads to use. Has no effect.
**warning_predict**: Probability to signal a warning during predict.
**warning_train**: Probability to signal a warning during train.
**x**: Numeric tuning parameter. Has no effect.
**iter**: Integer parameter for testing hotstarting.

Note that segfaults may not be triggered reliably on your operating system. Also note that if they work as intended, they will tear down your R session immediately!
Dictionary

This Learner can be instantiated via the dictionary mlr_learners or with the associated sugar function lrn():

mlr_learners$get("classif.debug")
lrn("classif.debug")

Meta Information

Examples

learner = lrn("classif.debug")
learner$param_set$values = list(message_train = 1, save_tasks = TRUE)

# this should signal a message
task = tsk("penguins")
learner$train(task)
learner$predict(task)

# task_train and task_predict are the input tasks for train() and predict()
names(learner$model)
**mlr_learners_classif.featureless**

*Featureless Classification Learner*

**Description**

A simple LearnerClassif which only analyzes the labels during train, ignoring all features. Hyperparameter method determines the mode of operation during prediction:

- **mode:** Predicts the most frequent label. If there are two or more labels tied, randomly selects one per prediction. Probabilities correspond to the relative frequency of the class labels in the training set.
- **sample:** Randomly predict a label uniformly. Probabilities correspond to a uniform distribution of class labels, i.e. 1 divided by the number of classes.
- **weighted.sample:** Randomly predict a label, with probability estimated from the training distribution. For consistency, probabilities are 1 for the sampled label and 0 for all other labels.

**Dictionary**

This Learner can be instantiated via the dictionary `mlr_learners` or with the associated sugar function `lrn()`:

```r
mlr_learners$get("classif.featureless")
lrn("classif.featureless")
```

**Meta Information**

- Task type: “classif”
- Predict Types: “response”, “prob”
- Required Packages: mlr3

**Parameters**

<table>
<thead>
<tr>
<th>Id</th>
<th>Type</th>
<th>Default</th>
<th>Levels</th>
</tr>
</thead>
<tbody>
<tr>
<td>method</td>
<td>character</td>
<td>mode</td>
<td>mode, sample, weighted.sample</td>
</tr>
</tbody>
</table>

**Super classes**

`mlr3::Learner -> mlr3::LearnerClassif -> LearnerClassifFeatureless`
Methods

Public methods:

- LearnerClassifFeatureless$new()
- LearnerClassifFeatureless$importance()
- LearnerClassifFeatureless$selected_features()
- LearnerClassifFeatureless$clone()

Method new(): Creates a new instance of this R6 class.

Usage:
LearnerClassifFeatureless$new()

Method importance(): All features have a score of 0 for this learner.

Usage:
LearnerClassifFeatureless$importance()

Returns: Named numeric().

Method selected_features(): Selected features are always the empty set for this learner.

Usage:
LearnerClassifFeatureless$selected_features()

Returns: character(0).

Method clone(): The objects of this class are cloneable with this method.

Usage:
LearnerClassifFeatureless$clone(deep = FALSE)

Arguments:
deept Whether to make a deep clone.

Methods

Public methods:

- \texttt{LearnerClassifRpart$new()}
- \texttt{LearnerClassifRpart$importance()}
- \texttt{LearnerClassifRpart$selected_features()}
- \texttt{LearnerClassifRpart$clone()}

Method \texttt{new()}: Creates a new instance of this R6 class.

\textit{Usage:}
\texttt{LearnerClassifRpart$new()}

Method \texttt{importance()}: The importance scores are extracted from the model slot \texttt{variable.importance}.

\textit{Usage:}
\texttt{LearnerClassifRpart$importance()}

\textit{Returns:} Named numeric().

Method \texttt{selected_features()}: Selected features are extracted from the model slot \texttt{frame$var}.

\textit{Usage:}
\texttt{LearnerClassifRpart$selected_features()}

\textit{Returns:} character().

Method \texttt{clone()}: The objects of this class are cloneable with this method.

\textit{Usage:}
\texttt{LearnerClassifRpart$clone(deep = FALSE)}

\textit{Arguments:}

- \texttt{deep} Whether to make a deep clone.

mlr_learners_regr.debug

Regression Learner for Debugging

Description

A simple LearnerRegr used primarily in the unit tests and for debugging purposes. If no hyperparameter is set, it simply constantly predicts the mean value of the training data. The following hyperparameters trigger the following actions:

predict_missing: Ratio of predictions which will be NA.

predict_missing_type: To encode missingness. “na” will insert NA values, “omit” will just return fewer predictions than requested.

save_tasks: Saves input task in model slot during training and prediction.

threads: Number of threads to use. Has no effect.

x: Numeric tuning parameter. Has no effect.

Dictionary

This Learner can be instantiated via the dictionary mlr_learners or with the associated sugar function lrn():

mlr_learners$get("regr.debug")
lrn("regr.debug")
Meta Information

- Task type: “regr”

```

---

### `mlr_learners_regr.featureless`  
*Featureless Regression Learner*

**Description**

A simple **LearnerRegr** which only analyzes the response during train, ignoring all features. If hyperparameter robust is `FALSE` (default), constantly predicts `mean(y)` as response and `sd(y)` as standard error. If robust is `TRUE`, `median()` and `mad()` are used instead of `mean()` and `sd()`, respectively.

**Dictionary**

This **Learner** can be instantiated via the **dictionary** `mlr_learners` or with the associated sugar function `lrn()`:

```r
  mlr_learners$get("regr.featureless")
  lrn("regr.featureless")
```
Meta Information

- Task type: “regr”
- Predict Types: “response”, “se”
- Required Packages: mlr3, ‘stats’

Parameters

<table>
<thead>
<tr>
<th>Id</th>
<th>Type</th>
<th>Default</th>
<th>Levels</th>
</tr>
</thead>
<tbody>
<tr>
<td>robust</td>
<td>logical</td>
<td>TRUE</td>
<td>TRUE, FALSE</td>

Dictionary of Performance Measures

Description

A simple mlr3misc::Dictionary storing objects of class Measure. Each measure has an associated help page, see mlr_measures_[id].

This dictionary can get populated with additional measures by add-on packages. E.g., mlr3proba adds survival measures and mlr3cluster adds cluster analysis measures.

For a more convenient way to retrieve and construct measures, see msr()/msrs().

Format

R6::R6Class object inheriting from mlr3misc::Dictionary.

Methods

See mlr3misc::Dictionary.

S3 methods

- as.data.table(dict, ..., objects = FALSE)
  
  mlr3misc::Dictionary -> data.table::data.table()

  Returns a data.table::data.table() with fields "key", "label", "task_type", "packages", "predict_type", and "task_properties" as columns. If objects is set to TRUE, the constructed objects are returned in the list column named object.

See Also

Sugar functions: msr(), msrs()

Implementation of most measures: mlr3measures

Other Dictionary: mlr_learners, mlr_resamplings, mlr_task_generators, mlr_tasks

Other Measure: Measure, MeasureClassif, MeasureRegr, MeasureSimilarity, mlr_measures_aic, mlr_measures_bic, mlr_measures_classif.costs, mlr_measures_debug_classif, mlr_measures_elapsed_time, mlr_measures_oob_error, mlr_measures_selected_features

Examples

as.data.table(mlr_measures)
mlr_measures$get("classif.ce")
msr("regr.mse")
Description

Calculates the Akaike Information Criterion (AIC) which is a trade-off between goodness of fit (measured in terms of log-likelihood) and model complexity (measured in terms of number of included features). Internally, \texttt{stats::AIC()} is called with parameter k (defaulting to 2). Requires the learner property “loglik”. NA is returned for unsupported learners.

Dictionary

This Measure can be instantiated via the dictionary \texttt{mlr_measures} or with the associated sugar function \texttt{msr()}:

\begin{verbatim}
mlr_measures$\text{get}("aic")
msr("aic")
\end{verbatim}

Meta Information

- Task type: “NA”
- Range: \((-\infty, \infty)\)
- Minimize: TRUE
- Average: macro
- Required Prediction: “NA”
- Required Packages: \texttt{mlr3}

Parameters

<table>
<thead>
<tr>

mlr_measures_oob_error, mlr_measures_selected_features

---

mlr_measures_bic  Bayesian Information Criterion Measure

Description

Calculates the Bayesian Information Criterion (BIC) which is a trade-off between goodness of fit
(measured in terms of log-likelihood) and model complexity (measured in terms of number of in-
cluded features). Internally, stats::BIC() is called. Requires the learner property "loglik", NA
is returned for unsupported learners.

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar
function mstr():

mlr_measures$get("bic")
msr("bic")
Meta Information

- Task type: “NA”
- Range: \((-\infty, \infty)\)
- Minimize: TRUE
- Average: macro
- Required Prediction: “NA”
- Required Packages: mlr3

Parameters

Empty ParamSet

Super class

mlr3::Measure -> MeasureBIC

Methods

Public methods:

- MeasureBIC$new()
- MeasureBIC$clone()

Method new(): Creates a new instance of this R6 class.

Usage:
MeasureBIC$new()

Method clone(): The objects of this class are cloneable with this method.

Usage:
MeasureBIC$clone(deep = FALSE)

Arguments:

- deep Whether to make a deep clone.

See Also

- Package mlr3measures for the scoring functions. Dictionary of Measures: mlr_measures as.data.table(mlr_measures) for a table of available Measures in the running session (depending on the loaded packages).
- Extension packages for additional task types:
  - mlr3proba for probabilistic supervised regression and survival analysis.
  - mlr3cluster for unsupervised clustering.

Other Measure: Measure, MeasureClassif, MeasureRegr, MeasureSimilarity, mlr_measures, mlr_measures_aic, mlr_measures_classif.costs, mlr_measures_debug_classif, mlr_measures_elapsed_time, mlr_measures_oob_error, mlr_measures_selected_features
Classification Accuracy

Description

Measure to compare true observed labels with predicted labels in multiclass classification tasks.

Details

The Classification Accuracy is defined as

$$\frac{1}{n} \sum_{i=1}^{n} w_i (t_i = r_i).$$

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function msr():

```r
mlr_measures$get("classif.acc")
msr("classif.acc")
```

Parameters

Empty ParamSet

Meta Information

- Type: "classif"
- Range: [0, 1]
- Minimize: FALSE
- Required prediction: response

Note

The score function calls mlr3measures::acc() from package mlr3measures.

If the measure is undefined for the input, NaN is returned. This can be customized by setting the field na_value.
**mlr_measures_classif.auc**

**Area Under the ROC Curve**

**Description**

Measure to compare true observed labels with predicted probabilities in binary classification tasks.

**Details**

Computes the area under the Receiver Operator Characteristic (ROC) curve. The AUC can be interpreted as the probability that a randomly chosen positive observation has a higher predicted probability than a randomly chosen negative observation.

This measure is undefined if the true values are either all positive or all negative.

**Dictionary**

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function m$sr()$:

mlr_measures$get("classif.auc")
msr("classif.auc")

**Parameters**

Empty ParamSet
**mlr_measures_classif.bacc**

**Balanced Accuracy**

**Description**

Measure to compare true observed labels with predicted labels in multiclass classification tasks.

**Meta Information**

- Type: "binary"
- Range: \([0, 1]\)
- Minimize: FALSE
- Required prediction: prob

**Note**

The score function calls `mlr3measures::auc()` from package `mlr3measures`. If the measure is undefined for the input, NaN is returned. This can be customized by setting the field `na_value`.

**See Also**

Dictionary of Measures: `mlr_measures`

as.data.table(mlr_measures) for a complete table of all (also dynamically created) Measure implementations.

**Details**

The Balanced Accuracy computes the weighted balanced accuracy, suitable for imbalanced data sets. It is defined analogously to the definition in sklearn.

First, the sample weights \( w \) are normalized per class:

\[
\hat{w}_i = \frac{w_i}{\sum_j 1(y_j = y_i)w_i}.
\]

The balanced accuracy is calculated as

\[
\frac{1}{\sum_i w_i} \sum_i 1(r_i = t_i)\hat{w}_i.
\]

**Dictionary**

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function msr():

```r
mlr_measures$get("classif.bacc")
msr("classif.bacc")
```

**Parameters**

Empty ParamSet

**Meta Information**

- Type: "classif"
- Range: \([0, 1]\)
- Minimize: FALSE
- Required prediction: response

**Note**

The score function calls `mlr3measures::bacc()` from package mlr3measures.

If the measure is undefined for the input, NaN is returned. This can be customized by setting the field `na_value`.

**See Also**

Dictionary of Measures: mlr_measures

as.data.table(mlr_measures) for a complete table of all (also dynamically created) Measure implementations.

---

**mlr_measures_classif.bbrier**

*Binary Brier Score*

**Description**

Measure to compare true observed labels with predicted probabilities in binary classification tasks.

**Details**

The Binary Brier Score is defined as

\[
\frac{1}{n} \sum_{i=1}^{n} w_i (I_i - p_i)^2.
\]

where \( w_i \) are the sample weights, \( I_i \) is 1 if observation \( i \) belongs to the positive class, and 0 otherwise.

Note that this (more common) definition of the Brier score is equivalent to the original definition of the multi-class Brier score (see `mbrier()`) divided by 2.

**Dictionary**

This *Measure* can be instantiated via the dictionary `mlr_measures` or with the associated sugar function `msr()`:

```r
mlr_measures$get("classif.bbrier")
msr("classif.bbrier")
```

**Parameters**

Empty ParamSet

**Meta Information**

- Type: "binary"
- Range: \([0, 1]\)
- Minimize: TRUE
- Required prediction: prob
Note

The score function calls `mlr3measures::bbrier()` from package `mlr3measures`. If the measure is undefined for the input, `NaN` is returned. This can be customized by setting the field `na_value`.

See Also

Dictionary of Measures: `mlr_measures` as.data.table(mlr_measures) for a complete table of all (also dynamically created) Measure implementations.

---

### mlr_measures_classif.ce

**Classification Error**

**Description**

Measure to compare true observed labels with predicted labels in multiclass classification tasks.

**Details**

The Classification Error is defined as

\[
\frac{1}{n} \sum_{i=1}^{n} w_i (t_i \neq r_i).
\]

**Dictionary**

This Measure can be instantiated via the dictionary `mlr_measures` or with the associated sugar function `msr()`:

```
mlr_measures$get("classif.ce")
msr("classif.ce")
```
Cost-sensitive Classification Measure

Description

Uses a cost matrix to create a classification measure. True labels must be arranged in columns, predicted labels must be arranged in rows. The cost matrix is stored as slot $costs$.

For calculation of the score, the confusion matrix is multiplied element-wise with the cost matrix. The costs are then summed up (and potentially divided by the number of observations if normalize is set to TRUE (default)).
Dictionary

This Measure can be instantiated via the dictionary `mlr_measures` or with the associated sugar function `msr()`:

```r
mlr_measures$get("classif.costs")
msr("classif.costs")
```

Meta Information

- Task type: “classif”
- Range: $(-\infty, \infty)$
- Minimize: TRUE
- Average: macro
- Required Prediction: “response”
- Required Packages: `mlr3`

Parameters

<table>
<thead>
<tr>
<th>Id</th>
<th>Type</th>
<th>Default</th>
<th>Levels</th>
</tr>
</thead>
<tbody>
<tr>
<td>normalize</td>
<td>logical</td>
<td>-</td>
<td>TRUE, FALSE</td>
</tr>
</tbody>
</table>

Super classes

`mlr3::Measure` $\rightarrow$ `mlr3::MeasureClassif` $\rightarrow$ `MeasureClassifCosts`

Active bindings

`costs` (numeric `matrix()`)

Matrix of costs (truth in columns, predicted response in rows).

Methods

Public methods:

- `MeasureClassifCosts$new()`
- `MeasureClassifCosts$clone()`

Method `new()`: Creates a new instance of this R6 class.

Usage:

```r
MeasureClassifCosts$new()
```

Method `clone()`: The objects of this class are cloneable with this method.

Usage:

```r
```
measure_classif.costs

MeasureClassifCosts$clone(deep = FALSE)

Arguments:

- **deep**: Whether to make a deep clone.

See Also

- Package [mlr3measures](https://mlr3.org/reference/mlr3measures.html) for the scoring functions. Dictionary of Measures: [mlr3measures](https://mlr3.org/reference/mlr3measures.html) as `as.data.table(mlr_measures)` for a table of available Measures in the running session (depending on the loaded packages).
- Extension packages for additional task types:
  - mlr3proba for probabilistic supervised regression and survival analysis.
  - mlr3cluster for unsupervised clustering.

Other Measure: [Measure, MeasureClassif, MeasureRegr, MeasureSimilarity, mlr_measures, mlr_measures_auc, mlr_measures_bic, mlr_measures_debug_classif, mlr_measures_elapsed_time, mlr_measures_oob_error, mlr_measures_selected_features]

Examples

```r
# get a cost sensitive task
task = tsk("german_credit")

# cost matrix as given on the UCI page of the german credit data set
# https://archive.ics.uci.edu/ml/datasets/statlog+(german+credit+data)
costs = matrix(c(0, 5, 1, 0), nrow = 2)
dimnames(costs) = list(truth = task$class_names, predicted = task$class_names)
print(costs)

costs = t(costs)

# mlr3 needs truth in columns, predictions in rows
costs = t(costs)

# create a cost measure which calculates the absolute costs
m = msr("classif.costs", id = "german_credit_costs", costs = costs, normalize = FALSE)
```

# fit models and evaluate with the cost measure
learner = lrn("classif.rpart")
rr = resample(task, learner, rsmp("cv", folds = 3))
rr$aggregate(m)

---

### Diagnostic Odds Ratio

**Description**

Measure to compare true observed labels with predicted labels in binary classification tasks.

**Details**

The Diagnostic Odds Ratio is defined as

\[
\frac{TP}{FP} \div \frac{FN}{TN} = \frac{TP}{FP} \cdot \frac{TN}{FN}
\]

This measure is undefined if FP = 0 or FN = 0.

**Dictionary**

This Measure can be instantiated via the dictionary `mlr_measures` or with the associated sugar function `msr()`:

```r
mlr_measures$get("classif.dor")
msr("classif.dor")
```

**Parameters**

Empty ParamSet

**Meta Information**

- Type: "binary"
- Range: \([0, \infty)\)
- Minimize: FALSE
- Required prediction: response

**Note**

The score function calls `mlr3measures::dor()` from package `mlr3measures`.

If the measure is undefined for the input, NaN is returned. This can be customized by setting the field `na_value`. 
mlr_measures_classif.fbeta

F-beta Score

Description

Measure to compare true observed labels with predicted labels in binary classification tasks.

Details

With $P$ as `precision()` and $R$ as `recall()`, the F-beta Score is defined as

\[
(1 + \beta^2) \frac{P \cdot R}{(\beta^2 P) + R}
\]

It measures the effectiveness of retrieval with respect to a user who attaches $\beta$ times as much importance to recall as precision. For $\beta = 1$, this measure is called "F1" score.

This measure is undefined if `precision` or `recall` is undefined, i.e. $TP + FP = 0$ or $TP + FN = 0$.

Dictionary

This Measure can be instantiated via the dictionary `mlr_measures` or with the associated sugar function `msr()`:

```r
mlr_measures$get("classif.fbeta")
msr("classif.fbeta")
```

Parameters
**mlr_measures_classif.fbeta**

<table>
<thead>
<tr>
<th>Id</th>
<th>Type</th>
<th>Default</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>beta</td>
<td>integer</td>
<td>-</td>
<td>[0, ∞)</td>
</tr>
</tbody>
</table>

**Meta Information**

- **Type**: "binary"
- **Range**: [0, 1]
- **Minimize**: FALSE
- **Required prediction**: response

**Note**

The score function calls `mlr3measures::fbeta()` from package `mlr3measures`.

If the measure is undefined for the input, NaN is returned. This can be customized by setting the field `na_value`.

**See Also**

- **Dictionary of Measures**: `mlr_measures`

as.data.table(mlr_measures) for a complete table of all (also dynamically created) Measure implementations.

False Discovery Rate

Description

Measure to compare true observed labels with predicted labels in binary classification tasks.

Details

The False Discovery Rate is defined as

\[
\text{FP} \quad \frac{\text{TP} + \text{FP}}{	ext{TP} + \text{FP}}.
\]

This measure is undefined if TP + FP = 0.

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function msr():

mlr_measures$get("classif.fdr")
msr("classif.fdr")

Parameters

Empty ParamSet

Meta Information

- Type: "binary"
- Range: [0, 1]
- Minimize: TRUE
- Required prediction: response

Note

The score function calls mlr3measures::fdr() from package mlr3measures. If the measure is undefined for the input, NaN is returned. This can be customized by setting the field na_value.
See Also

Dictionary of Measures: mlr_measures

as.data.table(mlr_measures) for a complete table of all (also dynamically created) Measure implementations.

---

mlr_measures_classif.fn

*False Negatives*

**Description**

Measure to compare true observed labels with predicted labels in binary classification tasks.

**Details**

This measure counts the false negatives (type 2 error), i.e. the number of predictions indicating a negative class label while in fact it is positive. This is sometimes also called a "false alarm".

**Dictionary**

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function msr():

```r
mlr_measures$get("classif.fn")
msr("classif.fn")
```

**Parameters**

Empty ParamSet
Meta Information

- Type: "binary"
- Range: \([0, \infty)\)
- Minimize: TRUE
- Required prediction: response

Note

The score function calls \texttt{mlr3measures::fn()} from package \texttt{mlr3measures}.

If the measure is undefined for the input, NaN is returned. This can be customized by setting the field \texttt{na_value}.

See Also

Dictionary of Measures: \texttt{mlr3measures}

\texttt{as.data.table(mlr_measures)} for a complete table of all (also dynamically created) \texttt{Measure} implementations.

---

\texttt{mlr_measures_classif.fnr}

\emph{False Negative Rate}

Description

Measure to compare true observed labels with predicted labels in binary classification tasks.
Details
The False Negative Rate is defined as
\[
\frac{FN}{TP + FN}
\]
Also known as "miss rate."
This measure is undefined if \(TP + FN = 0\).

Dictionary
This Measure can be instantiated via the dictionary \texttt{mlr_measures} or with the associated sugar function \texttt{msr()}:

\begin{verbatim}
mlr_measures$get("classif.fnr")
msr("classif.fnr")
\end{verbatim}

Parameters
Empty ParamSet

Meta Information
- Type: "binary"
- Range: [0, 1]
- Minimize: TRUE
- Required prediction: response

Note
The score function calls \texttt{mlr3measures::fnr()} from package \texttt{mlr3measures}.
If the measure is undefined for the input, NaN is returned. This can be customized by setting the field \texttt{na_value}.

See Also
Dictionary of Measures: \texttt{mlr_measures}
as.\texttt{data.table(mlr_measures)} for a complete table of all (also dynamically created) Measure implementations.

---

**mlr_measures_classif.fomr**

*False Omission Rate*

**Description**

Measure to compare true observed labels with predicted labels in binary classification tasks.

**Details**

The False Omission Rate is defined as

\[
\frac{FN}{FN + TN}
\]

This measure is undefined if FN + TN = 0.

**Dictionary**

This Measure can be instantiated via the dictionary `mlr_measures` or with the associated sugar function `msr()`:

```r
mlr_measures$get("classif.fomr")
msr("classif.fomr")
```

**Parameters**

Empty ParamSet

**Meta Information**

- Type: "binary"
- Range: [0, 1]
- Minimize: TRUE
- Required prediction: response

**Note**

The score function calls `mlr3measures::fomr()` from package `mlr3measures`. If the measure is undefined for the input, NaN is returned. This can be customized by setting the field `na_value`. 
### mlr_measures_classif.fp

**False Positives**

**Description**

Measure to compare true observed labels with predicted labels in binary classification tasks.

**Details**

This measure counts the false positives (type 1 error), i.e. the number of predictions indicating a positive class label while in fact it is negative.

**Dictionary**

This Measure can be instantiated via the dictionary `mlr_measures` or with the associated sugar function `msr()`:

```r
mlr_measures$get("classif.fp")
msr("classif.fp")
```

**Parameters**

Empty ParamSet
Meta Information

- Type: "binary"
- Range: \([0, \infty)\)
- Minimize: TRUE
- Required prediction: response

Note

The score function calls \texttt{mlr3measures::fp()} from package \texttt{mlr3measures}.

If the measure is undefined for the input, NaN is returned. This can be customized by setting the field \texttt{na_value}.

See Also

Dictionary of Measures: \texttt{mlr_measures}

\texttt{as.data.table(mlr_measures)} for a complete table of all (also dynamically created) Measure implementations.

Details
The False Positive Rate is defined as \[ \frac{FP}{FP + TN} \].

Also know as fall out or probability of false alarm.
This measure is undefined if \( FP + TN = 0 \).

Dictionary
This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function msr():

```r
mlr_measures$get("classif.fpr")
msr("classif.fpr")
```

Parameters
Empty ParamSet

Meta Information
- Type: "binary"
- Range: \([0, 1]\)
- Minimize: TRUE
- Required prediction: response

Note
The score function calls mlr3measures::fpr() from package mlr3measures.
If the measure is undefined for the input, NaN is returned. This can be customized by setting the field na_value.

See Also
Dictionary of Measures: mlr_measures
as.data.table(mlr_measures) for a complete table of all (also dynamically created) Measure implementations.

mlr_measures_classif.logloss

Description

Measure to compare true observed labels with predicted probabilities in multiclass classification tasks.

Details

The Log Loss is defined as

\[ -\frac{1}{n} \sum_{i=1}^{n} w_i \log(p_i) \]

where \( p_i \) is the probability for the true class of observation \( i \).

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function msr():

mlr_measures$get("classif.logloss")
msr("classif.logloss")

Parameters

Empty ParamSet

Meta Information

- Type: "classif"
- Range: \([0, \infty)\)
- Minimize: TRUE
- Required prediction: prob

Note

The score function calls mlr3measures::logloss() from package mlr3measures.

If the measure is undefined for the input, NaN is returned. This can be customized by setting the field na_value.
See Also

Dictionary of Measures: mlr_measures

as.data.table(mlr_measures) for a complete table of all (also dynamically created) Measure implementations.

mlr_measures_classif.mauc_au1p

Multiclass AUC Scores

Description

Measure to compare true observed labels with predicted probabilities in multiclass classification tasks.

Details

Multiclass AUC measures.

- **AU1U**: AUC of each class against the rest, using the uniform class distribution. Computes the AUC treating a c-dimensional classifier as c two-dimensional 1-vs-rest classifiers, where classes are assumed to have uniform distribution, in order to have a measure which is independent of class distribution change (Fawcett 2001).

- **AU1P**: AUC of each class against the rest, using the a-priori class distribution. Computes the AUC treating a c-dimensional classifier as c two-dimensional 1-vs-rest classifiers, taking into account the prior probability of each class (Fawcett 2001).

- **AUNU**: AUC of each class against each other, using the uniform class distribution. Computes something like the AUC of c(c - 1) binary classifiers (all possible pairwise combinations). See Hand (2001) for details.

- **AUNP**: AUC of each class against each other, using the a-priori class distribution. Computes something like AUC of c(c - 1) binary classifiers while considering the a-priori distribution of the classes as suggested in Ferri (2009). Note we deviate from the definition in Ferri (2009) by a factor of c. The person implementing this function and writing this very documentation right now cautions against using this measure because it is an imperfect generalization of AU1U.
This Measure can be instantiated via the dictionary \texttt{mlr_measures} or with the associated sugar function \texttt{msr()}:

\begin{verbatim}
mlr_measures$get("classif.mauc_au1p")
msr("classif.mauc_au1p")
\end{verbatim}

**Meta Information**

- Type: "classif"
- Range: $[0, 1]$
- Minimize: FALSE
- Required prediction: prob

**Note**

The score function calls \texttt{mlr3measures::mauc_au1p()} from package \texttt{mlr3measures}.

If the measure is undefined for the input, NaN is returned. This can be customized by setting the field \texttt{na.value}.

**See Also**

Dictionary of Measures: \texttt{mlr_measures}

\texttt{as.data.table(mlr_measures)} for a complete table of all (also dynamically created) Measure implementations.

**Multiclass AUC Scores**

**Description**

Measure to compare true observed labels with predicted probabilities in multiclass classification tasks.

**Details**

Multiclass AUC measures.

- **AUNU**: AUC of each class against the rest, using the uniform class distribution. Computes the AUC treating a c-dimensional classifier as c two-dimensional 1-vs-rest classifiers, where classes are assumed to have uniform distribution, in order to have a measure which is independent of class distribution change (Fawcett 2001).

- **AUNP**: AUC of each class against the rest, using the a-priori class distribution. Computes the AUC treating a c-dimensional classifier as c two-dimensional 1-vs-rest classifiers, taking into account the prior probability of each class (Fawcett 2001).

- **AU1U**: AUC of each class against each other, using the uniform class distribution. Computes something like the AUC of c(c - 1) binary classifiers (all possible pairwise combinations). See Hand (2001) for details.

- **AU1P**: AUC of each class against each other, using the a-priori class distribution. Computes something like AUC of c(c - 1) binary classifiers while considering the a-priori distribution of the classes as suggested in Ferri (2009). Note we deviate from the definition in Ferri (2009) by a factor of c. The person implementing this function and writing this very documentation right now cautions against using this measure because it is an imperfect generalization of AU1U.

**Dictionary**

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function msr():

```r
mlr_measures$get("classif.mauc_au1u")
msr("classif.mauc_au1u")
```

**Parameters**

Empty ParamSet

**Meta Information**

- Type: "classif"
- Range: [0, 1]
- Minimize: FALSE
- Required prediction: prob
Note

The score function calls `mlr3measures::mauc_aunp()` from package `mlr3measures`.

If the measure is undefined for the input, NaN is returned. This can be customized by setting the field `na_value`.

See Also

Dictionary of Measures: `mlr_measures` as.data.table(mlr_measures) for a complete table of all (also dynamically created) Measure implementations.

---

**mlr_measures_classif.mauc_aunp**

**Multiclass AUC Scores**

**Description**

Measure to compare true observed labels with predicted probabilities in multiclass classification tasks.

**Details**

Multiclass AUC measures.

- **AUNU**: AUC of each class against the rest, using the uniform class distribution. Computes the AUC treating a c-dimensional classifier as c two-dimensional 1-vs-rest classifiers, where classes are assumed to have uniform distribution, in order to have a measure which is independent of class distribution change (Fawcett 2001).

- **AUNP**: AUC of each class against the rest, using the a-priori class distribution. Computes the AUC treating a c-dimensional classifier as c two-dimensional 1-vs-rest classifiers, taking into account the prior probability of each class (Fawcett 2001).
• **AU1U**: AUC of each class against each other, using the uniform class distribution. Computes something like the AUC of $c(c - 1)$ binary classifiers (all possible pairwise combinations). See Hand (2001) for details.

• **AU1P**: AUC of each class against each other, using the a-priori class distribution. Computes something like AUC of $c(c - 1)$ binary classifiers while considering the a-priori distribution of the classes as suggested in Ferri (2009). Note we deviate from the definition in Ferri (2009) by a factor of $c$. The person implementing this function and writing this very documentation right now cautions against using this measure because it is an imperfect generalization of AU1U.

### Dictionary

This Measure can be instantiated via the dictionary `mlr_measures` or with the associated sugar function `msr()`:

```r
mlr_measures$get("classif.mauc_aunp")
msr("classif.mauc_aunp")
```

### Parameters

Empty ParamSet

### Meta Information

- **Type**: "classif"
- **Range**: [0, 1]
- **Minimize**: FALSE
- **Required prediction**: prob

### Note

The score function calls `mlr3measures::mauc_aunp()` from package `mlr3measures`. If the measure is undefined for the input, NaN is returned. This can be customized by setting the field `na_value`.

### See Also

Dictionary of Measures: `mlr_measures` as `data.table(mlr_measures)` for a complete table of all (also dynamically created) Measure implementations.

**Multiclass AUC Scores**

**Description**

Measure to compare true observed labels with predicted probabilities in multiclass classification tasks.

**Details**

Multiclass AUC measures.

- **AUNU**: AUC of each class against the rest, using the uniform class distribution. Computes the AUC treating a c-dimensional classifier as c two-dimensional 1-vs-rest classifiers, where classes are assumed to have uniform distribution, in order to have a measure which is independent of class distribution change (Fawcett 2001).

- **AUNP**: AUC of each class against the rest, using the a-priori class distribution. Computes the AUC treating a c-dimensional classifier as c two-dimensional 1-vs-rest classifiers, taking into account the prior probability of each class (Fawcett 2001).

The person implementing this function and writing this very documentation right now cautions against using this measure because it is an imperfect generalization of AU1U.

**Dictionary**

This Measure can be instantiated via the dictionary `mlr_measures` or with the associated sugar function `msr()`:

```r
mlr_measures$get("classif.mauc_aunu")
msr("classif.mauc_aunu")
```
Parameters

Empty ParamSet

Meta Information

- Type: "classif"
- Range: \([0, 1]\)
- Minimize: FALSE
- Required prediction: prob

Note

The score function calls \texttt{mlr3measures::mauc_aunu()} from package \texttt{mlr3measures}.

If the measure is undefined for the input, NaN is returned. This can be customized by setting the field \texttt{na_value}.

See Also

Dictionary of Measures: \texttt{mlr_measures}

\texttt{as.data.table(mlr_measures)} for a complete table of all (also dynamically created) \texttt{Measure} implementations.

Details

Brier score for multi-class classification problems with \(r\) labels defined as

\[
\frac{1}{n} \sum_{i=1}^{n} \sum_{j=1}^{r} (I_{ij} - p_{ij})^2.
\]

\(I_{ij}\) is 1 if observation \(i\) has true label \(j\), and 0 otherwise.

Note that there also is the more common definition of the Brier score for binary classification problems in \texttt{bbrier()}.

Dictionary

This \texttt{Measure} can be instantiated via the \texttt{dictionary mlr_measures} or with the associated sugar function \texttt{msr()}:

\[
\texttt{mlr_measures$get("classif.mbrier")}
\]
\[
\texttt{msr("classif.mbrier")}
\]

Parameters

Empty ParamSet

Meta Information

- Type: "classif"
- Range: \([0, 2]\)
- Minimize: \texttt{TRUE}
- Required prediction: \texttt{prob}

Note

The score function calls \texttt{mlr3measures::mbrier()} from package \texttt{mlr3measures}.

If the measure is undefined for the input, NaN is returned. This can be customized by setting the field \texttt{na_value}.

See Also

\texttt{Dictionary of Measures: mlr_measures}

\texttt{as.data.table(mlr_measures)} for a complete table of all (also dynamically created) \texttt{Measure} implementations.

**mlr_measures_classif.mcc**

Matthews Correlation Coefficient

**Description**

Measure to compare true observed labels with predicted labels in binary classification tasks.

**Details**

The Matthews Correlation Coefficient is defined as

\[
\frac{TP \cdot TN - FP \cdot FN}{\sqrt{(TP + FP)(TP + FN)(TN + FP)(TN + FN)}}.
\]

This above formula is undefined if any of the four sums in the denominator is 0. The denominator is then set to 1.

**Dictionary**

This Measure can be instantiated via the dictionary `mlr_measures` or with the associated sugar function `msr()`:

```r
mlr_measures$get("classif.mcc")
msr("classif.mcc")
```

**Parameters**

Empty ParamSet

**Meta Information**

- Type: "binary"
- Range: \([-1, 1]\]
- Minimize: FALSE
- Required prediction: response
Note

The score function calls `mlr3measures::mcc()` from package `mlr3measures`.

If the measure is undefined for the input, NaN is returned. This can be customized by setting the field `na_value`.

See Also

Dictionary of Measures: `mlr_measures`

as.data.table(`mlr_measures`) for a complete table of all (also dynamically created) Measure implementations.

---

**Negative Predictive Value**

**Description**

Measure to compare true observed labels with predicted labels in binary classification tasks.

**Details**

The Negative Predictive Value is defined as

\[
\text{NPV} = \frac{TN}{FN + TN}
\]

This measure is undefined if \(FN + TN = 0\).
Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function msr():

```r
mlr_measures$get("classif.npv")
msr("classif.npv")
```

Parameters

Empty ParamSet

Meta Information

- Type: "binary"
- Range: [0, 1]
- Minimize: FALSE
- Required prediction: response

Note

The score function calls `mlr3measures::npv()` from package mlr3measures.

If the measure is undefined for the input, NaN is returned. This can be customized by setting the field `na_value`.

See Also

Dictionary of Measures: mlr_measures

as.data.table(mlr_measures) for a complete table of all (also dynamically created) Measure implementations.

**mlr_measures_classif.ppv**

*Positive Predictive Value*

**Description**

Measure to compare true observed labels with predicted labels in binary classification tasks.

**Details**

The Positive Predictive Value is defined as

\[
\frac{TP}{TP + FP}
\]

Also known as "precision".

This measure is undefined if \(TP + FP = 0\).

**Dictionary**

This Measure can be instantiated via the dictionary `mlr_measures` or with the associated sugar function `msr()`:

```r
mlr_measures$get("classif.ppv")
msr("classif.ppv")
```

**Parameters**

Empty ParamSet

**Meta Information**

- Type: "binary"
- Range: \([0, 1]\)
- Minimize: FALSE
- Required prediction: response

**Note**

The score function calls `mlr3measures::ppv()` from package `mlr3measures`.

If the measure is undefined for the input, NaN is returned. This can be customized by setting the field `na_value`. 
### mlr_measures_classif.prauc

**Area Under the Precision-Recall Curve**

**Description**

Measure to compare true observed labels with predicted probabilities in binary classification tasks.

**Details**

Computes the area under the Precision-Recall curve (PRC). The PRC can be interpreted as the relationship between precision and recall (sensitivity), and is considered to be a more appropriate measure for unbalanced datasets than the ROC curve. The PRC is computed by integration of the piecewise function.

This measure is undefined if the true values are either all positive or all negative.

**Dictionary**

This Measure can be instantiated via the dictionary `mlr_measures` or with the associated sugar function `msr()`:

```r
mlr_measures$get("classif.prauc")
msr("classif.prauc")
```
mlr_measures_classif.precision

Parameters

Empty ParamSet

Meta Information

- Type: "binary"
- Range: [0, 1]
- Minimize: FALSE
- Required prediction: prob

Note

The score function calls mlr3measures::prauc() from package mlr3measures.
If the measure is undefined for the input, NaN is returned. This can be customized by setting the field na_value.

See Also

Dictionary of Measures: mlr_measures
as.data.table(mlr_measures) for a complete table of all (also dynamically created) Measure implementations.

mlr_measures_classif.precision

Positive Predictive Value

Description

Measure to compare true observed labels with predicted labels in binary classification tasks.
Details

The Positive Predictive Value is defined as

\[
\frac{TP}{TP + FP}
\]

Also know as "precision".
This measure is undefined if TP + FP = 0.

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function msr():

```r
mlr_measures$get("classif.precision")
msr("classif.precision")
```

Parameters

Empty ParamSet

Meta Information

- Type: "binary"
- Range: [0, 1]
- Minimize: FALSE
- Required prediction: response

Note

The score function calls mlr3measures::precision() from package mlr3measures.
If the measure is undefined for the input, NaN is returned. This can be customized by setting the field na_value.

mnr_measures_classif.sensitivity

True Positive Rate

Description

Measure to compare true observed labels with predicted labels in binary classification tasks.

Details

The True Positive Rate is defined as

\[
\frac{TP}{TP + FN}
\]

Also know as "recall" or "sensitivity".
This measure is undefined if TP + FN = 0.

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar
function msr():

mlr_measures$get("classif.sensitivity")
msr("classif.sensitivity")
**mlr_measures_classif.specificity**

**Parameters**
Empty ParamSet

**Meta Information**
- Type: "binary"
- Range: [0, 1]
- Minimize: FALSE
- Required prediction: response

**Note**
The score function calls `mlr3measures::sensitivity()` from package `mlr3measures`. If the measure is undefined for the input, NaN is returned. This can be customized by setting the field `na_value`.

**See Also**
Dictionary of Measures: `mlr_measures` as.data.table(mlr_measures) for a complete table of all (also dynamically created) Measure implementations.

---

**mlr_measures_classif.specificity**

*True Negative Rate*

**Description**
Measure to compare true observed labels with predicted labels in binary classification tasks.
The True Negative Rate is defined as
\[ \frac{TN}{FP + TN} \]
Also know as "specificity".
This measure is undefined if \( FP + TN = 0 \).

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function msr():

```r
mlr_measures$get("classif.specificity")
msr("classif.specificity")
```

Parameters

Empty ParamSet

Meta Information

- Type: "binary"
- Range: \([0, 1]\)
- Minimize: FALSE
- Required prediction: response

Note

The score function calls mlr3measures::specificity() from package mlr3measures.
If the measure is undefined for the input, NaN is returned. This can be customized by setting the field na_value.

See Also

Dictionary of Measures: mlr_measures
as.data.table(mlr_measures) for a complete table of all (also dynamically created) Measure implementations.

---

**mlr_measures_classif.tn**

*True Negatives*

**Description**

Measure to compare true observed labels with predicted labels in binary classification tasks.

**Details**

This measure counts the true negatives, i.e. the number of predictions correctly indicating a negative class label.

**Dictionary**

This Measure can be instantiated via the dictionary `mlr_measures` or with the associated sugar function `msr()`:

```r
mlr_measures$get("classif.tn")
msr("classif.tn")
```

**Parameters**

Empty ParamSet

**Meta Information**

- Type: "binary"
- Range: \([0, \infty)\)
- Minimize: FALSE
- Required prediction: response

**Note**

The score function calls `mlr3measures::tn()` from package `mlr3measures`.

If the measure is undefined for the input, NaN is returned. This can be customized by setting the field `na_value`. 
True Negative Rate

Description

Measure to compare true observed labels with predicted labels in binary classification tasks.

Details

The True Negative Rate is defined as

\[
\frac{TN}{FP + TN}
\]

Also known as "specificity".

This measure is undefined if \( FP + TN = 0 \).

Dictionary

This Measure can be instantiated via the dictionary \texttt{mlr_measures} or with the associated sugar function \texttt{msr()}:

\[
\text{mlr_measures}\$\text{get("classif.tnr")}
\]
\[
\text{msr("classif.tnr")}
\]
mlr_measures_classif.tnr

Parameters

Empty ParamSet

Meta Information

- Type: "binary"
- Range: [0, 1]
- Minimize: FALSE
- Required prediction: response

Note

The score function calls mlr3measures::tnr() from package mlr3measures.

If the measure is undefined for the input, NaN is returned. This can be customized by setting the field na_value.

See Also

Dictionary of Measures: mlr_measures

as.data.table(mlr_measures) for a complete table of all (also dynamically created) Measure implementations.

**mlr_measures_classif.tp**

*True Positives*

**Description**

Measure to compare true observed labels with predicted labels in binary classification tasks.

**Details**

This measure counts the true positives, i.e. the number of predictions correctly indicating a positive class label.

**Dictionary**

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function msr():

```r
mlr_measures$get("classif.tp")
msr("classif.tp")
```

**Parameters**

Empty ParamSet

**Meta Information**

- Type: "binary"
- Range: [0, ∞)
- Minimize: FALSE
- Required prediction: response

**Note**

The score function calls `mlr3measures::tp()` from package mlr3measures.

If the measure is undefined for the input, NaN is returned. This can be customized by setting the field `na_value`.

**See Also**

Dictionary of Measures: mlr_measures

as.data.table(mlr_measures) for a complete table of all (also dynamically created) Measure implementations.

mlr_measures_classif.tpr

True Positive Rate

Description

Measure to compare true observed labels with predicted labels in binary classification tasks.

Details

The True Positive Rate is defined as

$$\frac{TP}{TP + FN}$$

Also know as "recall" or "sensitivity".

This measure is undefined if TP + FN = 0.

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function msr():

```r
mlr_measures$get("classif.tpr")
msr("classif.tpr")
```

Parameters

Empty ParamSet
Meta Information

- Type: "binary"
- Range: [0, 1]
- Minimize: FALSE
- Required prediction: response

Note

The score function calls `mlr3measures::tpr()` from package `mlr3measures`. If the measure is undefined for the input, NaN is returned. This can be customized by setting the field `na_value`.

See Also

Dictionary of Measures: `mlr_measures`
as.data.table(mlr_measures) for a complete table of all (also dynamically created) Measure implementations.

---

`mlr_measures_debug_classif`

*Debug Measure for Classification*

**Description**

This measure returns the number of observations in the `PredictionClassif` object. Its main purpose is debugging. The parameter `na_ratio` (numeric(1)) controls the ratio of scores which randomly are set to NA, between 0 (default) and 1.
Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function msr():

```r
mlr_measures$get("debug_classif")
msr("debug_classif")
```

Meta Information

- Task type: “NA”
- Range: $[0, \infty)$
- Minimize: NA
- Average: macro
- Required Prediction: “response”
- Required Packages: mlr3

Parameters

<table>
<thead>
<tr>
<th>Id</th>
<th>Type</th>
<th>Default</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>na_ratio</td>
<td>numeric</td>
<td>-</td>
<td>[0, 1]</td>
</tr>
</tbody>
</table>

Super class

mlr3::Measure -> MeasureDebugClassif

Methods

Public methods:

- MeasureDebugClassif$new()
- MeasureDebugClassif$clone()

Method `new()`: Creates a new instance of this R6 class.

Usage:

```r
MeasureDebugClassif$new()
```

Method `clone()`: The objects of this class are cloneable with this method.

Usage:

```r
MeasureDebugClassif$clone(deep = FALSE)
```

Arguments:

- deep  Whether to make a deep clone.
mlr_measures_elapsed_time

Elapse Time Measure

Description

Measures the elapsed time during train ("time_train"), predict ("time_predict"), or both ("time_both").

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function msr():

mlr_measures$get("time_train")
msr("time_train")

Meta Information

- Task type: “NA”
- Range: \([0, \infty)\)
- Minimize: TRUE
- Average: macro
- Required Prediction: “NA”
- Required Packages: mlr3
**mlr_measures_elapsed_time**

**Parameters**

Empty ParamSet

**Super class**

`mlr3::Measure` -> `MeasureElapsedTime`

**Public fields**

`stages` (character())

Which stages of the learner to measure? Usually set during construction.

**Methods**

**Public methods:**

- `MeasureElapsedTime$new()`
- `MeasureElapsedTime$clone()`

**Method** `new()`: Creates a new instance of this R6 class.

*Usage:*

`MeasureElapsedTime$new(id = "elapsed_time", stages)`

*Arguments:*

- `id` (character(1))
  
  Identifier for the new instance.

- `stages` (character())
  
  Subset of ("train", "predict"). The runtime of provided stages will be summed.

**Method** `clone()`: The objects of this class are cloneable with this method.

*Usage:*

`MeasureElapsedTime$clone(deep = FALSE)`

*Arguments:*

- `deep` Whether to make a deep clone.

**See Also**

- Package `mlr3measures` for the scoring functions. Dictionary of Measures: `mlr_measures` as 数据表 `mlr_measures` for a table of available Measures in the running session (depending on the loaded packages).

- Extension packages for additional task types:
  
  - `mlr3proba` for probabilistic supervised regression and survival analysis.
  
  - `mlr3cluster` for unsupervised clustering.

Other Measure: `Measure, MeasureClassif, MeasureRegr, MeasureSimilarity, mlr_measures, mlr_measures_aic, mlr_measures_bic, mlr_measures_classif.costs, mlr_measures_debug_classif, mlr_measures_oob_error, mlr_measures_selected_features`
mlr_measures_oob_error

Out-of-bag Error Measure

Description

Returns the out-of-bag error of the Learner for learners that support it (learners with property “oob_error”). Returns NA for unsupported learners.

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function msr():

```r
mlr_measures$get("oob_error")
msr("oob_error")
```

Meta Information

- Task type: “NA”
- Range: $(-\infty, \infty)$
- Minimize: TRUE
- Average: macro
- Required Prediction: “NA”
- Required Packages: mlr3

Parameters

Empty ParamSet

Super class

```
mlr3::Measure -> MeasureOOBError
```

Methods

Public methods:

- `MeasureOOBError$new()`
- `MeasureOOBError$clone()`

Method `new()`: Creates a new instance of this R6 class.

Usage:

```r
MeasureOOBError$new()
```

Method `clone()`: The objects of this class are cloneable with this method.
Usage:
MeasureOOBError$clone(deep = FALSE)

Arguments:
depend Whether to make a deep clone.

See Also

- Package mlr3measures for the scoring functions. Dictionary of Measures: mlr_measures as.data.table(mlr_measures) for a table of available Measures in the running session (depending on the loaded packages).
- Extension packages for additional task types:
  - mlr3proba for probabilistic supervised regression and survival analysis.
  - mlr3cluster for unsupervised clustering.

Other Measure: Measure, MeasureClassif, MeasureRegr, MeasureSimilarity, mlr_measures, mlr_measures_aic, mlr_measures_bic, mlr_measures_classif.costs, mlr_measures_debug_classif, mlr_measures_elapsed_time, mlr_measures_selected_features

---

mlr_measures_regr.bias

Bias

Description

Measure to compare true observed response with predicted response in regression tasks.

Details

The Bias is defined as

$$\frac{1}{n} \sum_{i=1}^{n} w_i (t_i - r_i).$$

Good predictions score close to 0.

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function msr():

mlr_measures$get("regr.bias")
msr("regr.bias")

Parameters

Empty ParamSet
Meta Information

- Type: "regr"
- Range: \((-\infty, \infty)\)
- Minimize: NA
- Required prediction: response

Note

The score function calls `mlr3measures::bias()` from package `mlr3measures`. If the measure is undefined for the input, NaN is returned. This can be customized by setting the field `na_value`.

See Also

Dictionary of Measures: `mlr_measures`

as.data.table(mlr_measures) for a complete table of all (also dynamically created) Measure implementations.

**mlr_measures_regr.mae**

**Parameters**

Empty ParamSet

**Meta Information**

- Type: "regr"
- Range: \([-1, 1]\]
- Minimize: FALSE
- Required prediction: response

**Note**

The score function calls `mlr3measures::ktau()` from package `mlr3measures`. If the measure is undefined for the input, NaN is returned. This can be customized by setting the field `na_value`.

**See Also**

Dictionary of Measures: `mlr3measures`
as.data.table(mlr_measures) for a complete table of all (also dynamically created) Measure implementations.

**Description**

Measure to compare true observed response with predicted response in regression tasks.

**Details**

The Mean Absolute Error is defined as

\[
\frac{1}{n} \sum_{i=1}^{n} w_i |t_i - r_i| .
\]

**Dictionary**

This Measure can be instantiated via the dictionary `mlr_measures` or with the associated sugar function `msr()`:

```r
mlr_measures$get("regr.mae")
msr("regr.mae")
```
Mean Absolute Percent Error

**Description**

Measure to compare true observed response with predicted response in regression tasks.

**Details**

The Mean Absolute Percent Error is defined as

\[
\frac{1}{n} \sum_{i=1}^{n} w_i \left| \frac{t_i - r_i}{t_i} \right|
\]

This measure is undefined if any element of \( t \) is 0.
**Dictionary**

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function msr():

```r
mlr_measures$get("regr.mape")
msr("regr.mape")
```

**Parameters**

Empty ParamSet

**Meta Information**

- **Type:** "regr"
- **Range:** \([0, \infty)\)
- **Minimize:** TRUE
- **Required prediction:** response

**Note**

The score function calls `mlr3measures::mape()` from package mlr3measures. If the measure is undefined for the input, NaN is returned. This can be customized by setting the field `na_value`.

**See Also**

Dictionary of Measures: mlr_measures

as.data.table(mlr_measures) for a complete table of all (also dynamically created) Measure implementations.

---

**mlr_measures_regr.maxae**

*Max Absolute Error*

**Description**

Measure to compare true observed response with predicted response in regression tasks.
Details

The Max Absolute Error is defined as

\[ \text{max}(|t_i - r_i|). \]

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function msr():

\[
\text{mlr_measures}\$\text{get}(\"regr.maxae\")
\]
\[
\text{msr}(\"regr.maxae\")
\]

Parameters

Empty ParamSet

Meta Information

- Type: "regr"
- Range: \([0, \infty)\)
- Minimize: TRUE
- Required prediction: response

Note

The score function calls \texttt{mlr3measures::maxae()} from package \texttt{mlr3measures}.

If the measure is undefined for the input, NaN is returned. This can be customized by setting the field \texttt{na_value}.

See Also

Dictionary of Measures: mlr_measures

\texttt{as.data.table(mlr_measures)} for a complete table of all (also dynamically created) Measure implementations.

Median Absolute Error

Description

Measure to compare true observed response with predicted response in regression tasks.

Details

The Median Absolute Error is defined as

$$\text{median}_i |t_i - r_i|.$$

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function msr():

```r
mlr_measures$get("regr.medae")
msr("regr.medae")
```

Parameters

Empty ParamSet

Meta Information

- Type: "regr"
- Range: \([0, \infty)\)
- Minimize: TRUE
- Required prediction: response

Note

The score function calls \texttt{mlr3measures::medae()} from package \texttt{mlr3measures}.

If the measure is undefined for the input, NaN is returned. This can be customized by setting the field \texttt{na_value}.

See Also

Dictionary of Measures: \texttt{mlr_measures}
as.data.table(mlr_measures) for a complete table of all (also dynamically created) Measure implementations.

Other regression measures: \texttt{mlr_measures_regr.bias, mlr_measures_regr.ktau, mlr_measures_regr.mae, mlr_measures_regr.mape, mlr_measures_regr.maxae, mlr_measures_regr.medse, mlr_measures_regr.mse,}
**mlr_measures_regr.medse**

**Median Squared Error**

**Description**
Measure to compare true observed response with predicted response in regression tasks.

**Details**
The Median Squared Error is defined as

$$\text{median}_{i} \left[ (t_i - r_i)^2 \right].$$

**Dictionary**
This Measure can be instantiated via the dictionary `mlr_measures` or with the associated sugar function `msr()`:

```r
mlr_measures$get("regr.medse")
msr("regr.medse")
```

**Parameters**
Empty ParamSet

**Meta Information**
- Type: "regr"
- Range: $[0, \infty)$
- Minimize: TRUE
- Required prediction: response

**Note**
The score function calls `mlr3measures::medse()` from package `mlr3measures`.
If the measure is undefined for the input, NaN is returned. This can be customized by setting the field `na_value`. 
**mlr_measures_regr.mse**

**Mean Squared Error**

**Description**

Measure to compare true observed response with predicted response in regression tasks.

**Details**

The Mean Squared Error is defined as

\[ \frac{1}{n} \sum_{i=1}^{n} (t_i - r_i)^2. \]

**Dictionary**

This Measure can be instantiated via the dictionary `mlr_measures` or with the associated sugar function `msr()`:

```r
mlr_measures$get("regr.mse")
msr("regr.mse")
```

**Parameters**

Empty ParamSet

**Meta Information**

- Type: "regr"
- Range: \([0, \infty)\)
- Minimize: TRUE
- Required prediction: response
Note

The score function calls `mlr3measures::mse()` from package `mlr3measures`.

If the measure is undefined for the input, NaN is returned. This can be customized by setting the field `na_value`.

See Also

Dictionary of Measures: `mlr_measures`

as.data.table(mlr_measures) for a complete table of all (also dynamically created) Measure implementations.

`mlr_measures_regr.msle`

*Mean Squared Log Error*

Description

Measure to compare true observed response with predicted response in regression tasks.

Details

The Mean Squared Log Error is defined as

\[ \frac{1}{n} \sum_{i=1}^{n} w_i \left( \ln(1 + t_i) - \ln(1 + r_i) \right)^2. \]

This measure is undefined if any element of \( t \) or \( r \) is less than or equal to \(-1\).

Dictionary

This Measure can be instantiated via the dictionary `mlr_measures` or with the associated sugar function `msr()`:

```r
mlr_measures$get("regr.msle")
msr("regr.msle")
```

Parameters

Empty ParamSet
**Percent Bias**

**Description**

Measure to compare true observed response with predicted response in regression tasks.

**Details**

The Percent Bias is defined as

\[
\frac{1}{n} \sum_{i=1}^{n} w_i \frac{(t_i - r_i)}{|t_i|}.
\]

Good predictions score close to 0.

**Dictionary**

This Measure can be instantiated via the dictionary `mlr_measures` or with the associated sugar function `msr()`:

```r
mlr_measures$get("regr.pbias")
msr("regr.pbias")
```
**mlr_measures_regr.rae**

**Parameters**

Empty ParamSet

**Meta Information**

- **Type:** "regr"
- **Range:** \((-\infty, \infty)\)
- **Minimize:** NA
- **Required prediction:** response

**Note**

The score function calls `mlr3measures::pbias()` from package `mlr3measures`.

If the measure is undefined for the input, NaN is returned. This can be customized by setting the field `na_value`.

**See Also**

Dictionary of Measures: `mlr_measures`

`as.data.table(mlr_measures)` for a complete table of all (also dynamically created) Measure implementations.

---

**mlr_measures_regr.rae  Relative Absolute Error**

**Description**

Measure to compare true observed response with predicted response in regression tasks.

**Details**

The Relative Absolute Error is defined as

\[
\frac{\sum_{i=1}^{n} |t_i - r_i|}{\sum_{i=1}^{n} |t_i - \bar{t}|}.
\]

Can be interpreted as absolute error of the predictions relative to a naive model predicting the mean.

This measure is undefined for constant \(t\).
Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function msr():

```r
mlr_measures$get("regr.rae")
msr("regr.rae")
```

Parameters

Empty ParamSet

Meta Information

- Type: "regr"
- Range: \([0, \infty)\)
- Minimize: TRUE
- Required prediction: response

Note

The score function calls `mlr3measures::rae()` from package `mlr3measures`.

If the measure is undefined for the input, NaN is returned. This can be customized by setting the field `na_value`.

See Also

Dictionary of Measures: mlr_measures

as.data.table(mlr_measures) for a complete table of all (also dynamically created) Measure implementations.

---

`mlr_measures_regr.rmse`

*Root Mean Squared Error*

Description

Measure to compare true observed response with predicted response in regression tasks.
Details

The Root Mean Squared Error is defined as

$$\sqrt{\frac{1}{n} \sum_{i=1}^{n} w_i (t_i - r_i)^2}.$$ 

Dictionary

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function msr():

```r
mlr_measures$get("regr.rmse")
msr("regr.rmse")
```

Parameters

Empty ParamSet

Meta Information

- Type: "regr"
- Range: \([0, \infty)\)
- Minimize: TRUE
- Required prediction: response

Note

The score function calls `mlr3measures::rmse()` from package mlr3measures.

If the measure is undefined for the input, NaN is returned. This can be customized by setting the field `na_value`.

See Also

Dictionary of Measures: mlr_measures

as.data.table(mlr_measures) for a complete table of all (also dynamically created) Measure implementations.

Description

Measure to compare true observed response with predicted response in regression tasks.

Details

The Root Mean Squared Log Error is defined as

$$\sqrt{\frac{1}{n} \sum_{i=1}^{n} w_i (\ln(1 + t_i) - \ln(1 + r_i))^2}.$$ 

This measure is undefined if any element of \( t \) or \( r \) is less than or equal to \(-1\).

Dictionary

This Measure can be instantiated via the dictionary \texttt{mlr_measures} or with the associated sugar function \texttt{msr()}: 

\begin{verbatim}
mlr_measures$get("regr.rmsle")
msr("regr.rmsle")
\end{verbatim}

Parameters

Empty ParamSet

Meta Information

- Type: "regr"
- Range: \([0, \infty)\)
- Minimize: TRUE
- Required prediction: response

Note

The score function calls \texttt{mlr3measures::rmsle()} from package \texttt{mlr3measures}.

If the measure is undefined for the input, \texttt{NaN} is returned. This can be customized by setting the field \texttt{na_value}. 
See Also

Dictionary of Measures: mlr_measures

as.data.table(mlr_measures) for a complete table of all (also dynamically created) Measure implementations.

---

mlr_measures_regr.rrse

*Root Relative Squared Error*

**Description**

Measure to compare true observed response with predicted response in regression tasks.

**Details**

The Root Relative Squared Error is defined as

\[
\sqrt{\frac{\sum_{i=1}^{n} (t_i - r_i)^2}{\sum_{i=1}^{n} (t_i - \bar{t})^2}}.
\]

Can be interpreted as root of the squared error of the predictions relative to a naive model predicting the mean.

This measure is undefined for constant \( t \).

**Dictionary**

This Measure can be instantiated via the dictionary mlr_measures or with the associated sugar function msr():

```r
mlr_measures$get("regr.rrse")
msr("regr.rrse")
```

**Parameters**

Empty ParamSet

**Meta Information**

- Type: "regr"
- Range: \([0, \infty)\)
- Minimize: TRUE
- Required prediction: response
Note

The score function calls `mlr3measures::rrse()` from package `mlr3measures`.

If the measure is undefined for the input, `NaN` is returned. This can be customized by setting the field `na_value`.

See Also

Dictionary of Measures: `mlr_measures` as.data.table(mlr_measures) for a complete table of all (also dynamically created) Measure implementations.

---

`mlr_measures_regr.rse` Relative Squared Error

Description

Measure to compare true observed response with predicted response in regression tasks.

Details

The Relative Squared Error is defined as

\[ \frac{\sum_{i=1}^{n} (t_i - r_i)^2}{\sum_{i=1}^{n} (t_i - \bar{t})^2}. \]

Can be interpreted as squared error of the predictions relative to a naive model predicting the mean.

This measure is undefined for constant \( t \).

Dictionary

This Measure can be instantiated via the dictionary `mlr_measures` or with the associated sugar function `msr()`:

```r
mlr_measures$get("regr.rse")
msr("regr.rse")
```

Parameters

Empty ParamSet
Meta Information

- Type: "regr"
- Range: $[0, \infty)$
- Minimize: TRUE
- Required prediction: response

Note

The score function calls `mlr3measures::rse()` from package `mlr3measures`.
If the measure is undefined for the input, NaN is returned. This can be customized by setting the field `na_value`.

See Also

Dictionary of Measures: `mlr_measures` as `data.table(mlr_measures)` for a complete table of all (also dynamically created) Measure implementations.

---

**mlr_measures_regr.rsq**  \textit{R Squared}

Description

Measure to compare true observed response with predicted response in regression tasks.

Details

R Squared is defined as

$$1 - \frac{\sum_{i=1}^{n} (t_i - r_i)^2}{\sum_{i=1}^{n} (t_i - \bar{t})^2}.$$ 

Also known as coefficient of determination or explained variation. Subtracts the rse() from 1, hence it compares the squared error of the predictions relative to a naive model predicting the mean.

This measure is undefined for constant $t$.

Dictionary

This Measure can be instantiated via the dictionary `mlr_measures` or with the associated sugar function `msr()`:

```r
mlr_measures$get("regr.rsq")
msr("regr.rsq")
```
Parameters

Empty ParamSet

Meta Information

- Type: "regr"
- Range: \((-\infty, 1]\)
- Minimize: FALSE
- Required prediction: response

Note

The score function calls `mlr3measures::rsq()` from package `mlr3measures`.
If the measure is undefined for the input, NaN is returned. This can be customized by setting the field `na_value`.

See Also

Dictionary of Measures: `mlr_measures`
as.data.table(`mlr_measures`) for a complete table of all (also dynamically created) Measure implementations.

---

**mlr_measures_regr.sae**  *Sum of Absolute Errors*

Description

Measure to compare true observed response with predicted response in regression tasks.

Details

The Sum of Absolute Errors is defined as

\[
\sum_{i=1}^{n} |t_i - r_i| .
\]

Dictionary

This Measure can be instantiated via the dictionary `mlr_measures` or with the associated sugar function `msr()`:

```r
mlr_measures$get("regr.sae")
msr("regr.sae")
```
Parameters

Empty ParamSet

Meta Information

- Type: "regr"
- Range: \([0, \infty)\)
- Minimize: TRUE
- Required prediction: response

Note

The score function calls `mlr3measures::sae()` from package `mlr3measures`.
If the measure is undefined for the input, NaN is returned. This can be customized by setting the field `na_value`.

See Also

Dictionary of Measures: `mlr_measures`

as.data.table(mlr_measures) for a complete table of all (also dynamically created) Measure implementations.

---

mlr_measures_regr.smape

_Symmetric Mean Absolute Percent Error_

**Description**

Measure to compare true observed response with predicted response in regression tasks.

**Details**

The Symmetric Mean Absolute Percent Error is defined as

\[
\frac{2}{n} \sum_{i=1}^{n} \frac{|t_i - r_i|}{|t_i| + |r_i|}
\]

This measure is undefined if if any \(|t| + |r|\) is 0.
Dictionary

This Measure can be instantiated via the dictionary `mlr_measures` or with the associated sugar function `msr()`:

```r
mlr_measures$get("regr.smape")
msr("regr.smape")
```

Parameters

Empty ParamSet

Meta Information

- Type: "regr"
- Range: [0, 2]
- Minimize: TRUE
- Required prediction: response

Note

The score function calls `mlr3measures::smape()` from package `mlr3measures`. If the measure is undefined for the input, NaN is returned. This can be customized by setting the field `na_value`.

See Also

Dictionary of Measures: `mlr_measures` as.data.table(mlr_measures) for a complete table of all (also dynamically created) Measure implementations.

Details

Spearman’s rho is defined as Spearman’s rank correlation coefficient between truth and response. Calls \texttt{stats::cor()} with method set to "spearman".

Dictionary

This Measure can be instantiated via the dictionary \texttt{mlr_measures} or with the associated sugar function \texttt{msr()}:

\begin{verbatim}
mlr_measures$get("regr.srho")
msr("regr.srho")
\end{verbatim}

Parameters

Empty ParamSet

Meta Information

- Type: "regr"
- Range: \([-1, 1]\]
- Minimize: FALSE
- Required prediction: response

Note

The score function calls \texttt{mlr3measures::srho()} from package \texttt{mlr3measures}.

If the measure is undefined for the input, NaN is returned. This can be customized by setting the field \texttt{na_value}.

See Also

Dictionary of Measures: \texttt{mlr_measures}

\texttt{as.data.table(mlr_measures)} for a complete table of all (also dynamically created) Measure implementations.

**mlr_measures_regr.sse**  
*Sum of Squared Errors*

**Description**
Measure to compare true observed response with predicted response in regression tasks.

**Details**
The Sum of Squared Errors is defined as
\[
\sum_{i=1}^{n} (t_i - r_i)^2.
\]

**Dictionary**
This Measure can be instantiated via the dictionary `mlr_measures` or with the associated sugar function `msr()`:
```r
mlr_measures$get("regr.sse")
msr("regr.sse")
```

**Parameters**
Empty ParamSet

**Meta Information**
- Type: "regr"
- Range: \([0, \infty)\)
- Minimize: TRUE
- Required prediction: response

**Note**
The score function calls `mlr3measures::sse()` from package `mlr3measures`.
If the measure is undefined for the input, NaN is returned. This can be customized by setting the field `na_value`.

**See Also**
Dictionary of Measures: `mlr_measures`
as.data.table(mlr_measures) for a complete table of all (also dynamically created) Measure implementations.
Other regression measures: `mlr_measures_regr.bias, mlr_measures_regr.ktau, mlr_measures_regr.mae, mlr_measures_regr.mape, mlr_measures_regr.maxae, mlr_measures_regr.medae, mlr_measures_regr.medse`
**Selected Features Measure**

**Description**

Measures the number of selected features by extracting it from learners with property "selected_features". If parameter `normalize` is set to `TRUE`, the relative number of features instead of the absolute number of features is returned. Note that the models must be stored to be able to extract this information. If the learner does not support the extraction of used features, `NA` is returned.

This measure requires the Task and the Learner for scoring.

**Dictionary**

This Measure can be instantiated via the dictionary `mlr_measures` or with the associated sugar function `msr()`:

```r
mlr_measures$get("selected_features")
msr("selected_features")
```

**Meta Information**

- Task type: “NA”
- Range: `[0, ∞)`
- Minimize: `TRUE`
- Average: macro
- Required Prediction: “NA”
- Required Packages: `mlr3`

**Parameters**

<table>
<thead>
<tr>
<th>Id</th>
<th>Type</th>
<th>Default</th>
<th>Levels</th>
</tr>
</thead>
<tbody>
<tr>
<td>normalize</td>
<td>logical</td>
<td>-</td>
<td>TRUE, FALSE</td>
</tr>
</tbody>
</table>

**Super class**

`mlr3::Measure` -> `MeasureSelectedFeatures`
Methods

**Public methods:**

- `MeasureSelectedFeatures$new()`
- `MeasureSelectedFeatures$clone()`

**Method** `new()`: Creates a new instance of this R6 class.

*Usage:*

```r
MeasureSelectedFeatures$new()
```

**Method** `clone()`: The objects of this class are cloneable with this method.

*Usage:*

```r
MeasureSelectedFeatures$clone(deep = FALSE)
```

*Arguments:*

- `deep` Whether to make a deep clone.

See Also

- Package `mlr3measures` for the scoring functions. Dictionary of Measures: `mlr_measures` as.data.table(mlr_measures) for a table of available Measures in the running session (depending on the loaded packages).

- Extension packages for additional task types:
  - `mlr3proba` for probabilistic supervised regression and survival analysis.
  - `mlr3cluster` for unsupervised clustering.

Other Measure: `Measure, MeasureClassif, MeasureRegr, MeasureSimilarity, mlr_measures, mlr_measures_aic, mlr_measures_auc, mlr_measures bic, mlr_measures_classif.costs, mlr_measures_debug_classif, mlr_measures_elapsed_time, mlr_measures_oob_error`

Examples

```r
task = tsk("german_credit")
learner = lrn("classif.rpart")
rr = resample(task, learner, rsmp("cv", folds = 3), store_models = TRUE)

scores = rr$score(msr("selected_features"))
scores[, c("iteration", "selected_features")]
```
**mlr_measures_sim.jaccard**

*Jaccard Similarity Index*

**Description**

Measure to compare two or more sets w.r.t. their similarity.

**Details**

For two sets $A$ and $B$, the Jaccard Index is defined as

$$J(A, B) = \frac{|A \cap B|}{|A \cup B|}$$

If more than two sets are provided, the mean of all pairwise scores is calculated.

This measure is undefined if two or more sets are empty.

**Dictionary**

This Measure can be instantiated via the dictionary `mlr_measures` or with the associated sugar function `msr()`:

```r
code
mlr_measures$get("sim.jaccard")
msr("sim.jaccard")
```

**Meta Information**

- Type: "similarity"
- Range: [0, 1]
- Minimize: FALSE

**Note**

This measure requires learners with property "selected_features". The extracted feature sets are passed to `mlr3measures::jaccard()` from package `mlr3measures`.

If the measure is undefined for the input, NaN is returned. This can be customized by setting the field `na_value`.

**See Also**

Dictionary of Measures: `mlr_measures`

as.data.table(mlr_measures) for a complete table of all (also dynamically created) Measure implementations.

Other similarity measures: `mlr_measures_sim.phi`
**mlr_measures_sim.phi**  
*Phi Coefficient Similarity*

### Description

Measure to compare two or more sets w.r.t. their similarity.

### Details

The Phi Coefficient is defined as the Pearson correlation between the binary representation of two sets $A$ and $B$. The binary representation for $A$ is a logical vector of length $p$ with the $i$-th element being 1 if the corresponding element is in $A$, and 0 otherwise.

If more than two sets are provided, the mean of all pairwise scores is calculated.

This measure is undefined if one set contains none or all possible elements.

### Dictionary

This Measure can be instantiated via the dictionary `mlr_measures` or with the associated sugar function `msr()`:

```r
mlr_measures$get("sim.phi")
msr("sim.phi")
```

### Meta Information

- **Type**: "similarity"
- **Range**: $[-1, 1]$
- **Minimize**: FALSE

### Note

This measure requires learners with property "selected_features". The extracted feature sets are passed to `mlr3measures::phi()` from package `mlr3measures`.

If the measure is undefined for the input, `NaN` is returned. This can be customized by setting the field `na_value`.

### See Also

Dictionary of Measures: `mlr_measures`  
as.data.table(mlr_measures) for a complete table of all (also dynamically created) Measure implementations.  
Other similarity measures: `mlr_measures_sim.jaccard`
Description

A simple \texttt{mlr3misc::Dictionary} storing objects of class \texttt{Resampling}. Each resampling has an associated help page, see \texttt{mlr\_resamplings\_[id]}.

This dictionary can get populated with additional resampling strategies by add-on packages.

For a more convenient way to retrieve and construct resampling strategies, see \texttt{rsmp()}/\texttt{rsmps()}.

Format

\texttt{R6::R6Class} object inheriting from \texttt{mlr3misc::Dictionary}.

Methods

See \texttt{mlr3misc::Dictionary}.

S3 methods

- \texttt{as.data.table(dict, \ldots, objects = FALSE)}

\begin{verbatim}
  mlr3misc::Dictionary -> data.table::data.table()
\end{verbatim}

Returns a \texttt{data.table::data.table()} with columns "key", "label", "params", and "iters". If objects is set to TRUE, the constructed objects are returned in the list column named object.

See Also

Sugar functions: \texttt{rsmp()}/\texttt{rsmps()}

Other Dictionary: \texttt{mlr\_learners}, \texttt{mlr\_measures}, \texttt{mlr\_task\_generators}, \texttt{mlr\_tasks}

Other Resampling: \texttt{Resampling}, \texttt{mlr\_resamplings\_bootstrap}, \texttt{mlr\_resamplings\_custom}, \texttt{mlr\_resamplings\_custom\_cv}, \texttt{mlr\_resamplings\_cv}, \texttt{mlr\_resamplings\_holdout}, \texttt{mlr\_resamplings\_insample}, \texttt{mlr\_resamplings\_loo}, \texttt{mlr\_resamplings\_repeated\_cv}, \texttt{mlr\_resamplings\_subsampling}

Examples

\begin{verbatim}
  as.data.table(mlr\_resamplings)
  mlr\_resamplings\$get("cv")
  rsmp("subsampling")
\end{verbatim}
Description

Splits data into bootstrap samples (sampling with replacement). Hyperparameters are the number of bootstrap iterations (repeats, default: 30) and the ratio of observations to draw per iteration (ratio, default: 1) for the training set.

Dictionary

This Resampling can be instantiated via the dictionary mlr_resamplings or with the associated sugar function rsmp():

```r
mlr_resamplings$get("bootstrap")
rsmp("bootstrap")
```

Parameters

- **repeats** (integer(1))
  Number of repetitions.
- **ratio** (numeric(1))
  Ratio of observations to put into the training set.

Super class

mlr3::Resampling -> ResamplingBootstrap

Active bindings

- **iters** (integer(1))
  Returns the number of resampling iterations, depending on the values stored in the param_set.

Methods

Public methods:

- ResamplingBootstrap$new()
- ResamplingBootstrap$clone()

Method **new()**: Creates a new instance of this R6 class.

*Usage:*

ResamplingBootstrap$new()

Method **clone()**: The objects of this class are cloneable with this method.

*Usage:*
ResamplingBootstrap$clone(deep = FALSE)

Arguments:

deep Whether to make a deep clone.

References

See Also

Examples

```r
# Create a task with 10 observations
task = tsk("penguins")
task$filter(1:10)

# Instantiate Resampling
bootstrap = rsmp("bootstrap", repeats = 2, ratio = 1)
bootstrap$instance(task)

# Individual sets:
bootstrap$train_set(1)
bootstrap$test_set(1)

# Disjunct sets:
intersect(bootstrap$train_set(1), bootstrap$test_set(1))

# Internal storage:
bootstrap$instance$M # Matrix of counts
```
**Description**

Splits data into training and test sets using manually provided indices.

**Dictionary**

This Resampling can be instantiated via the dictionary `mlr_resamplings` or with the associated sugar function `rsmp()`:

```r
testsets <- mlr_resamplings$get("custom")
rsmp("custom")
```

**Super class**

`mlr3::Resampling` -> `ResamplingCustom`

**Active bindings**

- `iters` (integer(1))
  Returns the number of resampling iterations, depending on the values stored in the `param_set`.

**Methods**

**Public methods:**
- `ResamplingCustom$new()`
- `ResamplingCustom$instantiate()`
- `ResamplingCustom$clone()`

**Method new():** Creates a new instance of this R6 class.

*Usage:*

```r
ResamplingCustom$new()
```

**Method instantiate():** Instantiate this Resampling with custom splits into training and test set.

*Usage:*

```r
ResamplingCustom$instantiate(task, train_sets, test_sets)
```

*Arguments:*

- `task` Task
  Mainly used to check if `train_sets` and `test_sets` are feasible.
- `train_sets` (list of integer())
  List with row ids for training, one list element per iteration. Must have the same length as `test_sets`. 
**test_sets (list of integer())**

List with row ids for testing, one list element per iteration. Must have the same length as `train_sets`.

**Method clone()**: The objects of this class are cloneable with this method.

**Usage:**

`ResamplingCustom$clone(deep = FALSE)`

**Arguments:**

deep Whether to make a deep clone.

**See Also**

- Package mlr3spatiotempcv for spatio-temporal resamplings.
- Dictionary of Resamplings: mlr_resamplings

- mlr3spatiotempcv for additional Resamplings for spatio-temporal tasks.

Other Resampling: Resampling, mlr_resamplings, mlr_resamplings_bootstrap, mlr_resamplings_custom_cv, mlr_resamplings_cv, mlr_resamplings_holdout, mlr_resamplings_insample, mlr_resamplings_loo, mlr_resamplings_repeated_cv, mlr_resamplings_subsampling

**Examples**

```r
# Create a task with 10 observations
task = tsk("penguins")
task$filter(1:10)

# Instantiate Resampling
custom = rsmp("custom")
train_sets = list(1:5, 5:10)
test_sets = list(5:10, 1:5)
custom$instantiate(task, train_sets, test_sets)

custom$train_set(1)
custom$test_set(1)
```

---

**mlr_resamplings_custom_cv**

*Custom Cross-Validation*
Description

Splits data into training and test sets in a cross-validation fashion based on a user-provided categorical vector. This vector can be passed during instantiation either via an arbitrary factor \( f \) with the same length as \( \text{task$nrow} \), or via a single string \( \text{col} \) referring to a column in the task.

An alternative but equivalent approach using leave-one-out resampling is showcased in the examples of \text{mlr_resamplings_loo}.

Dictionary

This \text{Resampling} can be instantiated via the dictionary \text{mlr_resamplings} or with the associated sugar function \text{rsmp()}: 

\[
\begin{align*}
\text{mlr_resamplings$\text{get("custom_cv")}} \\
\text{rsmp("custom_cv")}
\end{align*}
\]

Super class

\text{mlr3::Resampling} -> \text{ResamplingCustomCV}

Active bindings

\( \text{iters (integer(1))} \)

Returns the number of resampling iterations, depending on the values stored in the \text{param_set}.

Methods

Public methods:

- \text{ResamplingCustomCV$new()}
- \text{ResamplingCustomCV$instantiate()}
- \text{ResamplingCustomCV$clone()}

\text{Method} \text{new():} Creates a new instance of this \text{R6} class.

\text{Usage:}
\text{ResamplingCustomCV$new()}

\text{Method} \text{instantiate():} Instantiate this \text{Resampling} as cross-validation with custom splits.

\text{Usage:}
\text{ResamplingCustomCV$instantiate(task, f = NULL, col = NULL)}

\text{Arguments:}

- \text{task} \text{Task}
  - Used to extract row ids.
- \( f \) (factor() | character())
  - Vector of type factor or character with the same length as \( \text{task$nrow} \). Row ids are split on this vector, each distinct value results in a fold. Empty factor levels are dropped and row ids corresponding to missing values are removed, c.f. \text{split()}.
col (character(1))
Name of the task column to use for splitting. Alternative and mutually exclusive to providing the factor levels as a vector via parameter \( f \).

**Method** `clone()`: The objects of this class are cloneable with this method.

**Usage:**
ResamplingCustomCV$clone(deep = FALSE)

**Arguments:**
deep Whether to make a deep clone.

**See Also**
- Package `mlr3spatiotempcv` for spatio-temporal resamplings.
- Dictionary of Resamplings: `mlr_resamplings`
- `as.data.table(mlr_resamplings)` for a table of available Resamplings in the running session (depending on the loaded packages).
- `mlr3spatiotempcv` for additional Resamplings for spatio-temporal tasks.

Other Resampling: Resampling, `mlr_resamplings`, `mlr_resamplings_bootstrap`, `mlr_resamplings_custom`, `mlr_resamplings_cv`, `mlr_resamplings_holdout`, `mlr_resamplings_insample`, `mlr_resamplings_loo`, `mlr_resamplings_repeated_cv`, `mlr_resamplings_subsampling`

**Examples**

```r
# Create a task with 10 observations
task = tsk("penguins")
task$filter(1:10)

# Instantiate Resampling:
custom_cv = rsmp("custom_cv")
f = factor(c(rep(letters[1:3], each = 3), NA))
custom_cv$instantiate(task, f = f)
custom_cv$iters # 3 folds

# Individual sets:
custom_cv$train_set(1)
custom_cv$test_set(1)

# Disjunct sets:
intersect(custom_cv$train_set(1), custom_cv$test_set(1))
```
Cross-Validation Resampling

Description

Splits data using a folds-folds (default: 10 folds) cross-validation.

Dictionary

This Resampling can be instantiated via the dictionary mlr_resamplings or with the associated sugar function rsmp():

```r
mlr_resamplings$get("cv")
rsm("cv")
```

Parameters

- `folds (integer(1))`
  Number of folds.

Super class

`mlr3::Resampling` -> ResamplingCV

Active bindings

- `iters (integer(1))`
  Returns the number of resampling iterations, depending on the values stored in the `param_set`.

Methods

Public methods:

- `ResamplingCV$new()`
- `ResamplingCV$clone()`

Method `new()`: Creates a new instance of this R6 class.

Usage:

```r
ResamplingCV$new()
```

Method `clone()`: The objects of this class are cloneable with this method.

Usage:

```r
ResamplingCV$clone(deep = FALSE)
```

Arguments:

- `deep` Whether to make a deep clone.

Other Resampling: Resampling, mlr_resamplings, mlr_resamplings_bootstrap, mlr_resamplings_custom, mlr_resamplings_custom_cv, mlr_resamplings_holdout, mlr_resamplings_insample, mlr_resamplings_loo, mlr_resamplings_repeated_cv, mlr_resamplings_subsampling

Examples

```r
# Create a task with 10 observations
task = tsk("penguins")
task$filter(1:10)

# Instantiate Resampling
cv = rsmp("cv", folds = 3)
cv$instance(task)

# Individual sets:
cv$train_set(1)
cv$test_set(1)

# Disjunct sets:
intersect(cv$train_set(1), cv$test_set(1))

# Internal storage:
cv$instance # table
```

---

**mlr_resamplings_holdout**

*Holdout Resampling*

**Description**

Splits data into a training set and a test set. Parameter ratio determines the ratio of observation going into the training set (default: 2/3).
Dictionary

This Resampling can be instantiated via the dictionary `mlr_resamplings` or with the associated sugar function `rsmp()`:

```r
mlr_resamplings$get("holdout")
rsmp("holdout")
```

Parameters

- `ratio` (numeric(1))
  Ratio of observations to put into the training set.

Super class

`mlr3::Resampling` -> `ResamplingHoldout`

Public fields

- `iters` (integer(1))
  Returns the number of resampling iterations, depending on the values stored in the `param_set`.

Methods

Public methods:

- `ResamplingHoldout$new()`
- `ResamplingHoldout$clone()`

Method `new()`: Creates a new instance of this R6 class.

Usage:

```r
ResamplingHoldout$new()
```

Method `clone()`: The objects of this class are cloneable with this method.

Usage:

```r
ResamplingHoldout$clone(deep = FALSE)
```

Arguments:

- `deep` Whether to make a deep clone.

Examples

```r
# Create a task with 10 observations
task = tsk("penguins")
task$filter(1:10)

# Instantiate Resampling
holdout = rsmp("holdout", ratio = 0.5)
holdout$instantiate(task)

# Individual sets:
holdout$train_set(1)
holdout$test_set(1)

# Disjunct sets:
intersect(holdout$train_set(1), holdout$test_set(1))

# Internal storage:
holdout$instance # simple list
```

---

**mlr_resamplings_insample**

**Insample Resampling**

**Description**

Uses all observations as training and as test set.

**Dictionary**

This Resampling can be instantiated via the dictionary mlr_resamplings or with the associated sugar function rsmp():

```r
mlr_resamplings$get("insample")
rsmp("insample")
```
**Super class**

`mlr3::Resampling` -> `ResamplingInsample`

**Public fields**

`iters` (integer(1))

- Returns the number of resampling iterations, depending on the values stored in the `param_set`.

**Methods**

**Public methods:**

- `ResamplingInsample$new()`
- `ResamplingInsample$clone()`

**Method `new()`**: Creates a new instance of this R6 class.

*Usage:*

`ResamplingInsample$new()`

**Method `clone()`**: The objects of this class are cloneable with this method.

*Usage:*

`ResamplingInsample$clone(deep = FALSE)`

*Arguments:*

- `deep` Whether to make a deep clone.

**See Also**

- Package `mlr3spatiotempcv` for spatio-temporal resamplings.
- Dictionary of Resamplings: `mlr_resamplings`
- `as.data.table(mlr_resamplings)` for a table of available Resamplings in the running session (depending on the loaded packages).
- `mlr3spatiotempcv` for additional Resamplings for spatio-temporal tasks.

**Other Resampling:** `Resampling, mlr_resamplings, mlr_resamplings_bootstrap, mlr_resamplings_custom, mlr_resamplings_custom_cv, mlr_resamplings_cv, mlr_resamplings_holdout, mlr_resamplings_loo, mlr_resamplings_repeated_cv, mlr_resamplings_subsampling`

**Examples**

```r
# Create a task with 10 observations
task = tsk("penguins")
task$filter(1:10)

# Instantiate Resampling
insample = rsm("insample")
insample$instantiate(task)
```
# Train set equal to test set:
setequal(insample$train_set(1), insample$test_set(1))

# Internal storage:
insample$instance # just row ids

---

**mlr_resamplings_loo  Leave-One-Out Cross-Validation**

**Description**

Splits data using leave-one-observation-out. This is identical to cross-validation with the number of
folds set to the number of observations.

If this resampling is combined with the grouping features of tasks, it is possible to create custom
splits based on an arbitrary factor variable, see the examples.

**Dictionary**

This Resampling can be instantiated via the dictionary **mlr_resamplings** or with the associated sugar
function **rsmp()**:

```r
mlr_resamplings$get("loo")
rsmp("loo")
```

**Super class**

```r
mlr3::Resampling -> ResamplingLOO
```

**Active bindings**

```r
iters (integer(1))
```

Returns the number of resampling iterations which is the number of rows of the task provided
to instantiate. Is NA if the resampling has not been instantiated.

**Methods**

**Public methods:**

- ResamplingLOO$new()
- ResamplingLOO$clone()

**Method new():** Creates a new instance of this R6 class.

*Usage:*

```r
ResamplingLOO$new()
```

**Method clone():** The objects of this class are cloneable with this method.

*Usage:*

```r
ResamplingLOO$clone(deep = FALSE)
```

*Arguments:*

depth  Whether to make a deep clone.

- mlr3spatiotempcv for additional Resamplings for spatio-temporal tasks.

Other Resampling: Resampling, mlr_resamplings, mlr_resamplings_bootstrap, mlr_resamplings_custom, mlr_resamplings_custom_cv, mlr_resamplings_cv, mlr_resamplings_holdout, mlr_resamplings_insample, mlr_resamplings_repeated_cv, mlr_resamplings_subsampling

Examples

```r
# Create a task with 10 observations
task = tsk("penguins")
task$filter(1:10)

# Instantiate Resampling
loo = rsmp("loo")
loo$instantiate(task)

# Individual sets:
loo$train_set(1)
loo$test_set(1)

# Disjunct sets:
intersect(loo$train_set(1), loo$test_set(1))

# Internal storage:
loo$instance # vector

# Combine with group feature of tasks:
task = tsk("penguins")
task$set_col_roles("island", add_to = "group")
loo$instantiate(task)
loo$iters # one fold for each level of "island"
```
**mlr_resamplings_repeated_cv**

*Repeated Cross-Validation Resampling*

**Description**

Splits data repeats (default: 10) times using a folds-fold (default: 10) cross-validation. The iteration counter translates to repeats blocks of folds cross-validations, i.e., the first folds iterations belong to a single cross-validation. Iteration numbers can be translated into folds or repeats with provided methods.

**Dictionary**

This Resampling can be instantiated via the dictionary *mlr_resamplings* or with the associated sugar function *rsmp()*:

```r
mlr_resamplings$get("repeated_cv")
rsmp("repeated_cv")
```

**Parameters**

- **repeats** (integer(1))
  Number of repetitions.
- **folds** (integer(1))
  Number of folds.

**Super class**

`mlr3::Resampling` -> `ResamplingRepeatedCV`

**Active bindings**

- **iters** (integer(1))
  Returns the number of resampling iterations, depending on the values stored in the param_set.

**Methods**

**Public methods:**

- `ResamplingRepeatedCV$new()`
- `ResamplingRepeatedCV$folds()`
- `ResamplingRepeatedCV$repeats()`
- `ResamplingRepeatedCV$clone()`

**Method** `new()`: Creates a new instance of this R6 class.

*Usage:*
ResamplingRepeatedCV$new()

**Method** folds(): Translates iteration numbers to fold numbers.

*Usage:*
ResamplingRepeatedCV$folds(iters)

*Arguments:*
- iters (integer())
  Iteration number.

*Returns:* integer() of fold numbers.

**Method** repeats(): Translates iteration numbers to repetition numbers.

*Usage:*
ResamplingRepeatedCV$repeats(iters)

*Arguments:*
- iters (integer())
  Iteration number.

*Returns:* integer() of repetition numbers.

**Method** clone(): The objects of this class are cloneable with this method.

*Usage:*
ResamplingRepeatedCV$clone(deep = FALSE)

*Arguments:*
- deep Whether to make a deep clone.

repeated_cv$instance # table

---

mlr_resamplings_subsampling

Subsampling Resampling

Description

Splits data repeats (default: 30) times into training and test set with a ratio of ratio (default: 2/3) observations going into the training set.

Dictionary

This Resampling can be instantiated via the dictionary mlr_resamplings or with the associated sugar function rsmp():

mlr_resamplings$get("subsampling")
rsmp("subsampling")

Parameters

- repeats (integer(1))
  Number of repetitions.
- ratio(numeric(1))
  Ratio of observations to put into the training set.

Super class

mlr3::Resampling -> ResamplingSubsampling
Active bindings

`iters (integer(1))`

Returns the number of resampling iterations, depending on the values stored in the `param_set`.

Methods

Public methods:

- `ResamplingSubsampling$new()`
- `ResamplingSubsampling$clone()`

Method `new()`: Creates a new instance of this R6 class.

Usage:

```
ResamplingSubsampling$new()
```

Method `clone()`: The objects of this class are cloneable with this method.

Usage:

```
ResamplingSubsampling$clone(deep = FALSE)
```

Arguments:

- `deep` Whether to make a deep clone.

Examples

```r
# Create a task with 10 observations
task = tsk("penguins")
task$filter(1:10)

# Instantiate Resampling
```
subsampling = rsmp("subsampling", repeats = 2, ratio = 0.5)
subsampling$instantiate(task)

# Individual sets:
subsampling$train_set(1)
subsampling$test_set(1)

# Disjunct sets:
intersect(subsampling$train_set(1), subsampling$test_set(1))

# Internal storage:
subsampling$instance$train # list of index vectors

---

**mlr_sugar**  
**Syntactic Sugar for Object Construction**

**Description**

Functions to retrieve objects, set hyperparameters and assign to fields in one go. Relies on `mlr3misc::dictionary_sugar_get()` to extract objects from the respective `mlr3misc::Dictionary`:

- `tsk()` for a Task from `mlr_tasks`.
- `tsks()` for a list of Tasks from `mlr_tasks`.
- `tgen()` for a TaskGenerator from `mlr_task_generators`.
- `tgens()` for a list of TaskGenerators from `mlr_task_generators`.
- `lrn()` for a Learner from `mlr_learners`.
- `lrns()` for a list of Learners from `mlr_learners`.
- `rsmp()` for a Resampling from `mlr_resamplings`.
- `rsmps()` for a list of Resamplings from `mlr_resamplings`.
- `msr()` for a Measure from `mlr_measures`.
- `msrs()` for a list of Measures from `mlr_measures`.

**Usage**

```r
tsk(.key, ...)

tsks(.keys, ...)

tgen(.key, ...)
tgens(.keys, ...)

lrn(.key, ...)
lrns(.keys, ...)
```

rsmp(.key, ...)
rsmps(.keys, ...)
msr(.key, ...)
msrs(.keys, ...)

Arguments

.key (character(1))
Key passed to the respective dictionary to retrieve the object.

... (named list())
Named arguments passed to the constructor, to be set as parameters in the paradox::ParamSet, or to be set as public field. See mlr3misc::dictionary_sugar_get() for more details.

.keys (character())
Keys passed to the respective dictionary to retrieve multiple objects.

Value

R6::R6Class object of the respective type, or a list of R6::R6Class objects for the plural versions.

Examples

# penguins task with new id
tsk("penguins", id = "penguins2")

# classification tree with different hyperparameters
# and predict type set to predict probabilities
lrn("classif.rpart", cp = 0.1, predict_type = "prob")

# multiple learners with predict type 'prob'
lrns(c("classif.featureless", "classif.rpart"), predict_type = "prob")

mlr_tasks

Dictionary of Tasks

Description

A simple mlr3misc::Dictionary storing objects of class Task. Each task has an associated help page, see mlr_tasks_[id].

This dictionary can get populated with additional tasks by add-on packages, e.g. mlr3data, mlr3proba or mlr3cluster. mlr3oml allows to interact with OpenML.

For a more convenient way to retrieve and construct tasks, see tsk()/tsks().
**Format**

**R6::R6Class** object inheriting from **mlr3misc::Dictionary**.

**Methods**

See **mlr3misc::Dictionary**.

**S3 methods**

- `as.data.table(dict, ..., objects = FALSE)`
  
  `mlr3misc::Dictionary -> data.table::data.table()`
  
  Returns a `data.table::data.table()` with columns "key", "label", "task_type", "nrow", "ncol", "properties", and the number of features of type "lgl", "int", "dbl", "chr", "fct" and "ord", respectively. If `objects` is set to `TRUE`, the constructed objects are returned in the list column named `object`.

**See Also**

Sugar functions: `tsk()`, `tsks()`

Extension Packages: **mlr3data**

Other Dictionary: **mlr_learners**, **mlr_measures**, **mlr_resamplings**, **mlr_task_generators**

**Examples**

```r
as.data.table(mlr_tasks)
task = mlr_tasks$get("penguins")  # same as tsk("penguins")
head(task$data())

# Add a new task, based on a subset of penguins:
data = palmerpenguins::penguins
data$species = factor(ifelse(data$species == "Adelie", "1", "0"))
task = TaskClassif$new("penguins.binary", data, target = "species", positive = "1")

# add to dictionary
mlr_tasks$add("penguins.binary", task)

# list available tasks
mlr_tasks$keys()

# retrieve from dictionary
mlr_tasks$get("penguins.binary")

# remove task again
mlr_tasks$remove("penguins.binary")
```
**mlr_tasks_boston_housing**

*Boston Housing Regression Task*

---

**Description**

A regression task for the mlbench::BostonHousing2 data set. This is the corrected data using the corrected median value (cmedv) as target. The uncorrected target (medv) is removed from the data.

**Format**

R6::R6Class inheriting from TaskRegr.

**Construction**

```r
mlr_tasks$get("boston_housing")
tsk("boston_housing")
```

**Meta Information**

- Task type: "regr"
- Dimensions: 506x18
- Properties: -
- Has Missings: FALSE
- Target: "cmedv"

**See Also**

  - Unsupervised clustering: mlr3cluster
  - Probabilistic supervised regression and survival analysis: [https://mlr3proba.mlr-org.com/](https://mlr3proba.mlr-org.com/)
Wisconsin Breast Cancer Classification Task

Description
A classification task for the mlbench::BreastCancer data set.

- Column "Id" has been removed.
- Column names have been converted to snake_case.
- Positive class is set to "malignant".
- 16 incomplete cases have been removed from the data set.
- All factor features have been converted to ordered factors.

Format
R6::R6Class inheriting from TaskClassif.

Dictionary
This Task can be instantiated via the dictionary mlr_tasks or with the associated sugar function tsk():

mlr_tasks$get("breast_cancer")
tsk("breast_cancer")

Meta Information
- Task type: "classif"
- Dimensions: 683x10
- Properties: "twoclass"
- Has Missings: FALSE
- Target: "class"
- Features: "bare_nuclei", "bl_cromatin", "cell_shape", "cell_size", "cl_thickness", "epith_c_size", "marg_adhesion", "mitoses", "normal_nucleoli"

mlr_tasks_german_credit

German Credit Classification Task

Description

A classification task for the German credit data set. The aim is to predict creditworthiness, labeled as "good" and "bad". Positive class is set to label "good".

See example for the creation of a MeasureClassifCosts as described misclassification costs.

Format

R6::R6Class inheriting from TaskClassif.

Dictionary

This Task can be instantiated via the dictionary mlr_tasks or with the associated sugar function tsk():

mlr_tasks$get("german_credit")
tsk("german_credit")
Meta Information

- Task type: “classif”
- Dimensions: 1000x21
- Properties: “twoclass”
- Has Missings: FALSE
- Target: “credit_risk”

Source

Data set originally published on UCI. This is the preprocessed version taken from package rchallenge with factors instead of dummy variables, and corrected as proposed by Ulrike Grömping.

measure = msr("classif.costs", id = "german_credit_costs", costs = costs)
print(measure)

mlr_tasks_iris Iris Classification Task

Description

A classification task for the popular datasets::iris data set.

Format

R6::R6Class inheriting from TaskClassif.

Dictionary

This Task can be instantiated via the dictionary mlr_tasks or with the associated sugar function tsk():

mlr_tasks$get("iris")
tsks("iris")

Meta Information

- Task type: “classif”
- Dimensions: 150x5
- Properties: “multiclass”
- Has Missings: FALSE
- Target: “Species”

Source

mlr_tasks_mtcars

Motor Trend Regression Task

Description

A regression task for the datasets::mtcars data set. Target variable is mpg (Miles/(US) gallon). Rownames are stored as variable ".rownames with column role "model".

Format

R6::R6Class inheriting from TaskRegr.

Construction

mlr_tasks$get("mtcars")
tsk("mtcars")

Meta Information

- Task type: "regr"
- Dimensions: 32x11
- Properties: -
- Has Missings: FALSE
- Target: “mpg”

mldr\_tasks\_penguins \hspace{1cm} Palmer Penguins Data Set

Description

Classification data to predict the species of penguins from the palmerpenguins package, see palmerpenguins::penguins. A better alternative to the iris data set.

Format

R6::R6Class inheriting from TaskClassif.

Dictionary

This Task can be instantiated via the dictionary mldr\_tasks or with the associated sugar function tsk():

mldr\_tasks\$get("penguins")
tsk("penguins")
Meta Information

- Task type: “classif”
- Dimensions: 344x8
- Properties: “multiclass”
- Has Missings: TRUE
- Target: “species”

Pre-processing

- The unit of measurement have been removed from the column names. Lengths are given in millimeters (mm), weight in gram (g).

Description

A classification task for the mlbench::PimaIndiansDiabetes2 data set. Positive class is set to "pos".

Format

R6::R6Class inheriting from TaskClassif.

Dictionary

This Task can be instantiated via the dictionary mlr_tasks or with the associated sugar function tsk():

```r
mlr_tasks$get("pima")
tske("pima")
```

Meta Information

- Task type: "classif"
- Dimensions: 768x9
- Properties: "twoclass"
- Has Missings: TRUE
- Target: "diabetes"
- Features: "age", "glucose", "insulin", "mass", "pedigree", "pregnant", "pressure", "triceps"

mlr_tasks_sonar

Sonar Classification Task

Description

A classification task for the mlbench::Sonar data set. Positive class is set to "M" (Mine).

Format

R6::R6Class inheriting from TaskClassif.

Dictionary

This Task can be instantiated via the dictionary mlr_tasks or with the associated sugar function tsk():

mlr_tasks$get("sonar")
tsk("sonar")

Meta Information

- Task type: "classif"
- Dimensions: 208x61
- Properties: "twoclass"
- Has Missings: FALSE
- Target: "Class"

mlr_tasks_spam  Spam Classification Task

Description

Spam data set from the UCI machine learning repository (http://archive.ics.uci.edu/dataset/94/spambase). Data set collected at Hewlett-Packard Labs to classify emails as spam or non-spam. 57 variables indicate the frequency of certain words and characters in the e-mail. The positive class is set to "spam".

Format

R6::R6Class inheriting from TaskClassif.

Dictionary

This Task can be instantiated via the dictionary mlr_tasks or with the associated sugar function tsk():

    mlr_tasks$get("spam")
    tsk("spam")

Meta Information

- Task type: "classif"
- Dimensions: 4601x58
- Properties: “twoclass”
- Has Missings: FALSE
- Target: “type”

Source

Donor: George Forman (gforman at nospam hpl.hp.com) 650-857-7835

Preprocessing: Columns have been renamed. Preprocessed data taken from the kernlab package.

### Wine Classification Task

**Description**

Wine data set from the UCI machine learning repository ([http://archive.ics.uci.edu/dataset/109/wine](http://archive.ics.uci.edu/dataset/109/wine)). Results of a chemical analysis of three types of wines grown in the same region in Italy but derived from three different cultivars.

**Format**

*R6::R6Class* inheriting from *TaskClassif*.

**Dictionary**

This Task can be instantiated via the dictionary *mlr_tasks* or with the associated sugar function *tsk()*:

```r
mlr_tasks$get("wine")
tsk("wine")
```

**Meta Information**

- Task type: “classif”
- Dimensions: 178x14
- Properties: “multiclass”
- Has Missings: FALSE
- Target: “type”

mlr_tasks_zoo  
Zoo Classification Task

Description

A classification task for the mlbench::Zoo data set. Rownames are stored as variable ".rownames" with column role "name".

Format

R6::R6Class inheriting from TaskClassif.

Dictionary

This Task can be instantiated via the dictionary mlr_tasks or with the associated sugar function tsk():

```r
mlr_tasks$get("zoo")
tsk("zoo")
```
Meta Information

- Task type: “classif”
- Dimensions: 101x17
- Properties: “multiclass”
- Has Missings: FALSE
- Target: “type”

mlr_task_generators

Dictionary of Task Generators

Description

A simple mlr3misc::Dictionary storing objects of class TaskGenerator. Each task generator has an associated help page, see mlr_task_generators_[id].

This dictionary can get populated with additional task generators by add-on packages.

For a more convenient way to retrieve and construct task generators, see tgen()/tgens().

Format

R6::R6Class object inheriting from mlr3misc::Dictionary.
Methods

See mlr3misc::Dictionary.

S3 methods

- `as.data.table(dict,...,objects = FALSE)`
  
  Returns a `data.table::data.table()` with fields "key", "label", "task_type", "params", and "packages" as columns. If `objects` is set to `TRUE`, the constructed objects are returned in the list column named `object`.

See Also

Sugar functions: `tgen()`, `tgens()`

Other Dictionary: `mlr_learners`, `mlr_measures`, `mlr_resamplings`, `mlr_tasks`

Other TaskGenerator: `TaskGenerator`, `mlr_task_generators_2dnormals`, `mlr_task_generators_cassini`, `mlr_task_generators_circle`, `mlr_task_generators_friedman1`, `mlr_task_generators_moons`, `mlr_task_generators_simplex`, `mlr_task_generators_smiley`, `mlr_task_generators_spirals`, `mlr_task_generators_xor`

Examples

```r
mlr_task_generators$get("smiley")
tgen("2dnormals")
```

---

**mlr_task_generators_2dnormals**

2D Normals Classification Task Generator

Description

A TaskGenerator for the 2d normals task in `mlbench::mlbench.2dnormals()`.

Dictionary

This TaskGenerator can be instantiated via the dictionary `mlr_task_generators` or with the associated sugar function `tgen()`:

```r
mlr_task_generators$get("2dnormals")
tgen("2dnormals")
```

Parameters

<table>
<thead>
<tr>
<th>Id</th>
<th>Type</th>
<th>Default</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>cl</td>
<td>integer</td>
<td>-</td>
<td>[2, (\infty))</td>
</tr>
<tr>
<td>r</td>
<td>numeric</td>
<td>-</td>
<td>[1, (\infty))</td>
</tr>
<tr>
<td>sd</td>
<td>numeric</td>
<td>-</td>
<td>[0, (\infty))</td>
</tr>
</tbody>
</table>
Super class

\texttt{mlr3::TaskGenerator} \rightarrow \texttt{TaskGenerator2DNormals}

Methods

Public methods:

- \texttt{TaskGenerator2DNormals$\texttt{\char92}new()}
- \texttt{TaskGenerator2DNormals$\texttt{\char92}plot()}
- \texttt{TaskGenerator2DNormals$\texttt{\char92}clone()}

Method \texttt{\char92}new(): Creates a new instance of this R6 class.

\textit{Usage:}

\texttt{TaskGenerator2DNormals$\texttt{\char92}new()}

Method \texttt{\char92}plot(): Creates a simple plot of generated data.

\textit{Usage:}

\texttt{TaskGenerator2DNormals$\texttt{\char92}plot(n = 200L, pch = 19L, \ldots)}

\textit{Arguments:}

- \texttt{n (integer(1))}
  Number of samples to draw for the plot. Default is 200.
- \texttt{pch (integer(1))}
  Point char. Passed to \texttt{\char92}plot().
- \texttt{\ldots (any)}
  Additional arguments passed to \texttt{\char92}plot().

Method \texttt{\char92}clone(): The objects of this class are cloneable with this method.

\textit{Usage:}

\texttt{TaskGenerator2DNormals$\texttt{\char92}clone(deep = FALSE)}

\textit{Arguments:}

- \texttt{deep} Whether to make a deep clone.

See Also

- Dictionary of TaskGenerators: \texttt{mlr_task_generators}
- \texttt{as.data.table(mlr_task_generators)} for a table of available TaskGenerators in the running session (depending on the loaded packages).
- Extension packages for additional task types:
  - \texttt{mlr3proba} for probabilistic supervised regression and survival analysis.
  - \texttt{mlr3cluster} for unsupervised clustering.

Other TaskGenerator: \texttt{TaskGenerator,mlr_task_generators,mlr_task_generators_cassini,mlr_task_generators_circle,mlr_task_generators_friedman1,mlr_task_generators_moons,mlr_task_generators_simplex,mlr_task_generators_smiley,mlr_task_generators_spirals,mlr_task_generators_xor}
Examples

generator = tgen("2dnormals")
plot(generator, n = 200)

task = generator$generate(200)
str(task$data())

mlr_task_generators_cassini

Cassini Classification Task Generator

Description

A TaskGenerator for the cassini task in mlbench::mlbench.cassini().

Dictionary

This TaskGenerator can be instantiated via the dictionary mlr_task_generators or with the associated sugar function tgen():

mlr_task_generators$get("cassini")
tgen("cassini")

Parameters

<table>
<thead>
<tr>
<th>Id</th>
<th>Type</th>
<th>Default</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>relsize1</td>
<td>integer</td>
<td>2</td>
<td>[1, ∞)</td>
</tr>
<tr>
<td>relsize2</td>
<td>integer</td>
<td>2</td>
<td>[1, ∞)</td>
</tr>
<tr>
<td>relsize3</td>
<td>integer</td>
<td>1</td>
<td>[1, ∞)</td>
</tr>
</tbody>
</table>

Super class

mlr3::TaskGenerator -> TaskGeneratorCassini

Methods

Public methods:

- TaskGeneratorCassini$new()
- TaskGeneratorCassini$plot()
- TaskGeneratorCassini$clone()

Method new(): Creates a new instance of this R6 class.
Usage:
TaskGeneratorCassini$new()

Method plot(): Creates a simple plot of generated data.

Usage:
TaskGeneratorCassini$plot(n = 200L, pch = 19L, ...)

Arguments:
  n (integer(1))
    Number of samples to draw for the plot. Default is 200.
  pch (integer(1))
    Point char. Passed to plot().
  ... (any)
    Additional arguments passed to plot().

Method clone(): The objects of this class are cloneable with this method.

Usage:
TaskGeneratorCassini$clone(deep = FALSE)

Arguments:
  deep Whether to make a deep clone.

See Also

- Dictionary of TaskGenerators: mlr_task_generators
- as.data.table(mlr_task_generators) for a table of available TaskGenerators in the running session (depending on the loaded packages).
- Extension packages for additional task types:
  - mlr3proba for probabilistic supervised regression and survival analysis.
  - mlr3cluster for unsupervised clustering.

Other TaskGenerator: TaskGenerator, mlr_task_generators, mlr_task_generators_2dnormals, mlr_task_generators_circle, mlr_task_generators_friedman1, mlr_task_generators_moons, mlr_task_generators_simplex, mlr_task_generators_smiley, mlr_task_generators_spirals, mlr_task_generators_xor

Examples

generator = tgen("cassini")
plot(generator, n = 200)

task = generator$generate(200)
str(task$data())
Circle Classification Task Generator

Description

A TaskGenerator for the circle binary classification task in `mlbench::mlbench.circle()`. Creates a large circle containing a smaller circle.

Dictionary

This TaskGenerator can be instantiated via the dictionary `mlr_task_generators` or with the associated sugar function `tgen()`:

```r
mlr_task_generators$get("circle")
tgen("circle")
```

Parameters

<table>
<thead>
<tr>
<th>Id</th>
<th>Type</th>
<th>Default</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>d</td>
<td>integer</td>
<td>2</td>
<td>[2, ∞)</td>
</tr>
</tbody>
</table>

Super class

`mlr3::TaskGenerator` -> `TaskGeneratorCircle`

Methods

**Public methods:**
- `TaskGeneratorCircle$new()`
- `TaskGeneratorCircle$plot()`
- `TaskGeneratorCircle$clone()`

**Method new():** Creates a new instance of this R6 class.

*Usage:*

```r
TaskGeneratorCircle$new()
```

**Method plot():** Creates a simple plot of generated data.

*Usage:*

```r
TaskGeneratorCircle$plot(n = 200L, pch = 19L, ...)
```

*Arguments:*
mlr_task_generators_friedman1

Friedman1 Regression Task Generator

Description

A TaskGenerator for the friedman1 task in mlbench::mlbench.friedman1().

n (integer(1))
   Number of samples to draw for the plot. Default is 200.
pch (integer(1))
   Point char. Passed to plot().
   ...
   Additional arguments passed to plot().

Method clone(): The objects of this class are cloneable with this method.

Usage:
TaskGeneratorCircle$clone(deep = FALSE)

Arguments:
   deep Whether to make a deep clone.

See Also

- Dictionary of TaskGenerators: mlr_task_generators
- as.data.table(mlr_task_generators) for a table of available TaskGenerators in the running session (depending on the loaded packages).
- Extension packages for additional task types:
  - mlr3proba for probabilistic supervised regression and survival analysis.
  - mlr3cluster for unsupervised clustering.

Other TaskGenerator: TaskGenerator, mlr_task_generators, mlr_task_generators_2dnormals, mlr_task_generators_cassini, mlr_task_generators_friedman1, mlr_task_generators_moons, mlr_task_generators_simplex, mlr_task_generators_smiley, mlr_task_generators_spirals, mlr_task_generators_xor

Examples

generator = tgen("circle")
plot(generator, n = 200)

task = generator$generate(200)
str(task$data())
Dictionary

This TaskGenerator can be instantiated via the dictionary `mlr_task_generators` or with the associated sugar function `tgen()`:

```r
mlr_task_generators$get("friedman1")
tgen("friedman1")
```

Parameters

<table>
<thead>
<tr>
<th>Id</th>
<th>Type</th>
<th>Default</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>sd</td>
<td>numeric</td>
<td>1</td>
<td>[0, ∞)</td>
</tr>
</tbody>
</table>

Super class

`mlr3::TaskGenerator` -> `TaskGeneratorFriedman1`

Methods

Public methods:
- `TaskGeneratorFriedman1$new()`
- `TaskGeneratorFriedman1$clone()`

Method `new()`: Creates a new instance of this R6 class.

*Usage:*

`TaskGeneratorFriedman1$new()`

Method `clone()`: The objects of this class are cloneable with this method.

*Usage:*

`TaskGeneratorFriedman1$clone(deep = FALSE)`

*Arguments:*

- `deep` Whether to make a deep clone.

See Also

- Dictionary of TaskGenerators: `mlr_task_generators`
- `as.data.table(mlr_task_generators)` for a table of available TaskGenerators in the running session (depending on the loaded packages).
- Extension packages for additional task types:
  - `mlr3proba` for probabilistic supervised regression and survival analysis.
  - `mlr3cluster` for unsupervised clustering.

Other TaskGenerator: `TaskGenerator, mlr_task_generators, mlr_task_generators_2dnormals, mlr_task_generators_cassini, mlr_task_generators_circle, mlr_task_generators_moons, mlr_task_generators_simplex, mlr_task_generators_smiley, mlr_task_generators_spirals, mlr_task_generators_xor`
Examples

generator = tgen("friedman1")
    task = generator$generate(200)
    str(task$data())

Description

A TaskGenerator creating two interleaving half circles ("moons") as binary classification problem.

Dictionary

This TaskGenerator can be instantiated via the dictionary mlr_task_generators or with the associated sugar function tgen():

    mlr_task_generators$get("moons")
    tgen("moons")

Parameters

<table>
<thead>
<tr>
<th>Id</th>
<th>Type</th>
<th>Default</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>sigma</td>
<td>numeric</td>
<td>-</td>
<td>[0, ∞)</td>
</tr>
</tbody>
</table>

Super class

mlr3::TaskGenerator -> TaskGeneratorMoons

Methods

Public methods:

- TaskGeneratorMoons$new()
- TaskGeneratorMoons$plot()
- TaskGeneratorMoons$clone()

Method new(): Creates a new instance of this R6 class.

Usage:
    TaskGeneratorMoons$new()

Method plot(): Creates a simple plot of generated data.
Usage:
TaskGeneratorMoons$plot(n = 200L, pch = 19L, ...)

Arguments:
  n (integer(1))
    Number of samples to draw for the plot. Default is 200.
  pch (integer(1))
    Point char. Passed to plot().
... (any)
  Additional arguments passed to plot().

Method clone(): The objects of this class are cloneable with this method.

Usage:
TaskGeneratorMoons$clone(deep = FALSE)

Arguments:
  deep Whether to make a deep clone.

See Also

- Dictionary of TaskGenerators: mlr_task_generators
- as.data.table(mlr_task_generators) for a table of available TaskGenerators in the running session (depending on the loaded packages).
- Extension packages for additional task types:
  - mlr3proba for probabilistic supervised regression and survival analysis.
  - mlr3cluster for unsupervised clustering.

Other TaskGenerator: TaskGenerator, mlr_task_generators, mlr_task_generators_2dnormal, mlr_task_generators_cassini, mlr_task_generators_circle, mlr_task_generators_friedman1, mlr_task_generators_simplex, mlr_task_generators_smiley, mlr_task_generators_spirals, mlr_task_generators_xor

Examples

generator = tgen("moons")
plot(generator, n = 200)

task = generator$generate(200)
str(task$data())
Description

A TaskGenerator for the simplex task in `mlbench::mlbench.simplex()`.
Note that the generator implemented in `mlbench` returns fewer samples than requested.

Dictionary

This TaskGenerator can be instantiated via the dictionary `mlr_task_generators` or with the associated sugar function `tgen()`:

```
mlr_task_generators$get("simplex")
tgen("simplex")
```

Parameters

<table>
<thead>
<tr>
<th>Id</th>
<th>Type</th>
<th>Default</th>
<th>Levels</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>center</td>
<td>logical</td>
<td>TRUE</td>
<td>TRUE, FALSE</td>
<td>-</td>
</tr>
<tr>
<td>d</td>
<td>integer</td>
<td>3</td>
<td>[1, ∞)</td>
<td></td>
</tr>
<tr>
<td>sd</td>
<td>numeric</td>
<td>0.1</td>
<td>[0, ∞)</td>
<td></td>
</tr>
<tr>
<td>sides</td>
<td>integer</td>
<td>1</td>
<td>[1, ∞)</td>
<td></td>
</tr>
</tbody>
</table>

Super class

```
mlr3::TaskGenerator -> TaskGeneratorSimplex
```

Methods

Public methods:

- `TaskGeneratorSimplex$new()`
- `TaskGeneratorSimplex$plot()`
- `TaskGeneratorSimplex$clone()`

Method `new()`: Creates a new instance of this R6 class.

Usage:

```
TaskGeneratorSimplex$new()
```

Method `plot()`: Creates a simple plot of generated data.

Usage:

```
```
TaskGeneratorSimplex$plot(n = 200L, pch = 19L, ...)  
**Arguments:**  
n (integer(1))  
Number of samples to draw for the plot. Default is 200.  
pch (integer(1))  
Point char. Passed to `plot()`.  
... (any)  
Additional arguments passed to `plot()`.

**Method** `clone()`: The objects of this class are cloneable with this method.  
**Usage:**  
TaskGeneratorSimplex$clone(deep = FALSE)  
**Arguments:**  
deep  Whether to make a deep clone.

**See Also**  
- Dictionary of TaskGenerators: `mlr_task_generators`  
- `as.data.table(mlr_task_generators)` for a table of available TaskGenerators in the running session (depending on the loaded packages).  
- Extension packages for additional task types:  
  - `mlr3proba` for probabilistic supervised regression and survival analysis.  
  - `mlr3cluster` for unsupervised clustering.

Other TaskGenerator: `TaskGenerator, mlr_task_generators, mlr_task_generators_2dnormals, mlr_task_generators_cassini, mlr_task_generators_circle, mlr_task_generators_friedman1, mlr_task_generators_moons, mlr_task_generators_smiley, mlr_task_generators_spirals, mlr_task_generators_xor`

**Examples**  
```r  
generator = tgen("simplex")  
plot(generator, n = 200)  

task = generator$generate(200)  
str(task$data())  
```
Dictionary

This TaskGenerator can be instantiated via the dictionary `mlr_task_generators` or with the associated sugar function `tgen()`:

```r
mlr_task_generators$get("smiley")
tgen("smiley")
```

Parameters

<table>
<thead>
<tr>
<th>Id</th>
<th>Type</th>
<th>Default</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>sd1</td>
<td>numeric</td>
<td>-</td>
<td>(0, ∞)</td>
</tr>
<tr>
<td>sd2</td>
<td>numeric</td>
<td>-</td>
<td>(0, ∞)</td>
</tr>
</tbody>
</table>

Super class

`mlr3::TaskGenerator` -> `TaskGeneratorSmiley`

Methods

**Public methods:**
- `TaskGeneratorSmiley$new()`
- `TaskGeneratorSmiley$plot()`
- `TaskGeneratorSmiley$clone()`

**Method** `new()`: Creates a new instance of this R6 class.

*Usage:*

```r
TaskGeneratorSmiley$new()
```

**Method** `plot()`: Creates a simple plot of generated data.

*Usage:*

```r
TaskGeneratorSmiley$plot(n = 200L, pch = 19L, ...)
```

*Arguments:*
- `n` (integer(1))
  - Number of samples to draw for the plot. Default is 200.
- `pch` (integer(1))
  - Point char. Passed to `plot()`.
- `...` (any)
  - Additional arguments passed to `plot()`.

**Method** `clone()`: The objects of this class are cloneable with this method.

*Usage:*

```r
TaskGeneratorSmiley$clone(deep = FALSE)
```

*Arguments:*
- `deep` Whether to make a deep clone.

  - mlr3proba for probabilistic supervised regression and survival analysis.
  - mlr3cluster for unsupervised clustering.

Other TaskGenerator: TaskGenerator.mlrr_task_generators.mlrr_task_generators_2dnormals, mlr_task_generators_cassini, mlr_task_generators_circle, mlr_task_generators_friedman1, mlr_task_generators_moons, mlr_task_generators_simplex, mlr_task_generators_spirals, mlr_task_generators_xor

Examples

generator = tgen("smiley")
plot(generator, n = 200)

task = generator$generate(200)
str(task$data())

---
mlr_task_generators_spirals

Spiral Classification Task Generator

Description

A TaskGenerator for the spirals task in mlbench::mlbench.spirals().

Dictionary

This TaskGenerator can be instantiated via the dictionary mlr_task_generators or with the associated sugar function tgen():

mlr_task_generators$get("spirals")
tgen("spirals")

Parameters

<table>
<thead>
<tr>
<th>Id</th>
<th>Type</th>
<th>Default</th>
<th>Range</th>
</tr>
</thead>

Super class

`mlr3::TaskGenerator` -> `TaskGeneratorSpirals`

Methods

Public methods:

- `TaskGeneratorSpirals$new()`
- `TaskGeneratorSpirals$plot()`
- `TaskGeneratorSpirals$clone()`

Method `new()`: Creates a new instance of this R6 class.

Usage:

```r
TaskGeneratorSpirals$new()
```

Method `plot()`: Creates a simple plot of generated data.

Usage:

```r
TaskGeneratorSpirals$plot(n = 200L, pch = 19L, ...)
```

Arguments:

- `n` (integer(1))
  - Number of samples to draw for the plot. Default is 200.
- `pch` (integer(1))
  - Point char. Passed to `plot()`.
- `...` (any)
  - Additional arguments passed to `plot()`.

Method `clone()`: The objects of this class are cloneable with this method.

Usage:

```r
TaskGeneratorSpirals$clone(deep = FALSE)
```

Arguments:

- `deep` Whether to make a deep clone.

See Also

- Dictionary of TaskGenerators: `mlr_task_generators`
- `as.data.table(mlr_task_generators)` for a table of available TaskGenerators in the running session (depending on the loaded packages).

Extension packages for additional task types:

- `mlr3proba` for probabilistic supervised regression and survival analysis.
- `mlr3cluster` for unsupervised clustering.

Other TaskGenerator: `TaskGenerator,mlr_task_generators,mlr_task_generators_2dnormals,mlr_task_generators_cassini,mlr_task_generators_circle,mlr_task_generators_friedman1,mlr_task_generators_moons,mlr_task_generators_simplex,mlr_task_generators_smiley,mlr_task_generators_xor`
Examples

generator = tgen("spirals")
plot(generator, n = 200)

task = generator$generate(200)
str(task$data())

Description

A TaskGenerator for the xor task in mlbench::mlbench.xor().

Dictionary

This TaskGenerator can be instantiated via the dictionary mlr_task_generators or with the associated sugar function tgen():

mlr_task_generators$get("xor")
tgen("xor")

Parameters

<table>
<thead>
<tr>
<th>Id</th>
<th>Type</th>
<th>Default</th>
<th>Range</th>
</tr>
</thead>
<tbody>
<tr>
<td>d</td>
<td>integer</td>
<td>1</td>
<td>[1, ∞)</td>
</tr>
</tbody>
</table>

Super class

\texttt{mlr3::TaskGenerator} -> TaskGeneratorXor

Methods

Public methods:
- TaskGeneratorXor$new()
- TaskGeneratorXor$plot()
- TaskGeneratorXor$clone()

Method \texttt{new}(): Creates a new instance of this R6 class.

Usage:
TaskGeneratorXor$new()
Method `plot()`: Creates a simple plot of generated data.

Usage:
TaskGeneratorXor$plot(n = 200L, pch = 19L, ...)

Arguments:
n (integer(1))
  Number of samples to draw for the plot. Default is 200.
pch (integer(1))
  Point char. Passed to `plot()`.
... (any)
  Additional arguments passed to `plot()`.

Method `clone()`: The objects of this class are cloneable with this method.

Usage:
TaskGeneratorXor$clone(deep = FALSE)

Arguments:
deep  Whether to make a deep clone.

See Also

- Dictionary of TaskGenerators: `mlr_task_generators`
- `as.data.table(mlr_task_generators)` for a table of available TaskGenerators in the running session (depending on the loaded packages).
- Extension packages for additional task types:
  - `mlr3proba` for probabilistic supervised regression and survival analysis.
  - `mlr3cluster` for unsupervised clustering.

Other TaskGenerator: `TaskGenerator, mlr_task_generators, mlr_task_generators_2dnormals, mlr_task_generators_cassini, mlr_task_generators_circle, mlr_task_generators_friedman1, mlr_task_generators_moons, mlr_task_generators_simplex, mlr_task_generators_smiley, mlr_task_generators_spirals`

Examples

generator = tgen("xor")
plot(generator, n = 200)

task = generator$generate(200)
str(task$data())
mlr_test_helpers

Documentation of mlr3 test helpers

Description

The mlr3 package contains various helper functions to test the validity of objects such as learners. These functions are not contained in the mlr3 namespaces and are instead located in the `inst/testthat` directory of the source package or the `testthat` directory of the installed package.

These files can be sourced with the following line of code:

```r
lapply(list.files(system.file("testthat", package = "mlr3"), pattern = "^helper.*\.[Rr]", full.names = TRUE), source)
```

Other extension packages such as mlr3proba have similar files that can be sourced accordingly.

This manual page documents the most important helper functions that are relevant when users implement their own custom learners.

run_autotest()

This function runs a Learner's automatic test suite.

During the autotests, multiple tasks are generated depending on the properties of the learner. The `run_autotest()` function then trains the learner on each task and predicts with all supported predict types. (see argument `predict_types`). To debug, simply run `result = run_autotest(learner)` and proceed with investigating the task, learner and prediction of the returned `result`.

For example usages you can look at the autotests in various mlr3 source repositories such as mlr3learners.

Parameters:

- learner (Learner)
  The learner to check.
- N (integer(1))
  The number of rows of the generated tasks.
- exclude (character())
  Each task on which the learner is trained has an id. If for some reason, one or more such tests ought to be disabled, this argument takes in a regular expression that disables all tasks whose id matches the regular expression.
- predict_types (character())
  The predict types of the learner to check. Defaults to all predict types of the learner.
- check_replicable (logical(1))
  Whether to check that running the learner twice with the same seed should result in identical predictions. Default is `TRUE`.
run_paramtest()

Description:
Checks parameters of mlr3 Learners against parameters defined in the upstream functions of the respective learner. The goal is to detect if parameters have been dropped or added in the upstream implementation. Some learners do not have all of their parameters stored within the learner function that is called during training. Sometimes learners come with a "control" function, e.g. glmnet.control() from package glmnet. Such learners need to be checked as well since they make up the full ParamSet of the respective learner.

To work nicely with the defined ParamSet, certain parameters need to be excluded because these are only present in either the "control" object or the actual top-level function call. Such exclusions should go into argument exclude with a comment for the reason of the exclusion. See examples for more information.

For example usages you can look at the parameter tests in various mlr3 source repositories such as mlr3learners.

Parameters:

- learner (Learner)
The learner whose parameter set is being checked.
- fun (function() or list of functions()s)
The function(s) containing the parameters that must be implemented by the learner.
- exclude (character()
Argument names that specified through this argument are exempt from checking. This can be used when parameters that are available in the fun function(s) are not implemented in the learner, or when the learner implements additional parameters that are not available in the fun function(s).
- tag (character(1))
Only parameters that are tagged with this tag are being checked. If NULL (default), all parameters are checked.

expect_learner()

Checks various properties that learners have to satisfy. Used for testing learner implementations, especially if all methods and fields are implement as document.

Parameters:

- lrn :: (Learner)
The learner whose properties are being verified.
- tsk :: (Task)
Optional argument (default is NULL). If provided, some additional checks are being run that check the compatibility of the learner and task.
- check_man :: (logical(1))
Whether to check if the learner has a man page.
Manually Partition into Training and Test Set

Description

Creates a split of the row ids of a Task into a training set and a test set while optionally stratifying on the target column.

For more complex partitions, see the example.

Usage

\[
\text{partition}(\text{task}, \text{ratio} = 0.67, \text{stratify} = \text{TRUE}, \ldots)
\]

\[
\text{## S3 method for class 'TaskRegr'}
\text{partition}(\text{task}, \text{ratio} = 0.67, \text{stratify} = \text{TRUE}, \text{bins} = 3L, \ldots)
\]

\[
\text{## S3 method for class 'TaskClassif'}
\text{partition}(\text{task}, \text{ratio} = 0.67, \text{stratify} = \text{TRUE}, \ldots)
\]

Arguments

\begin{itemize}
\item \textbf{task} \hfill (Task)
\begin{itemize}
\item Task to operate on.
\end{itemize}
\item \textbf{ratio} \hfill (numeric(1))
\begin{itemize}
\item Ratio of observations to put into the training set.
\end{itemize}
\item \textbf{stratify} \hfill (logical(1))
\begin{itemize}
\item If TRUE, stratify on the target variable. For regression tasks, the target variable is first cut into bins bins. See Task\$add_strata().
\end{itemize}
\item \textbf{bins} \hfill (integer(1))
\begin{itemize}
\item Number of bins to cut the target variable into for stratification.
\end{itemize}
\item \textbf{...} \hfill (any)
\begin{itemize}
\item Additional arguments, currently not used.
\end{itemize}
\end{itemize}

Examples

\[
\text{# regression task}
\text{task = tsk("boston_housing")}
\]

\[
\text{# roughly equal size split while stratifying on the binned response}
\text{split = partition(task, ratio = 0.5)}
\text{data = data.frame(}
\text{ \quad y = c(task\$truth(split$train), task\$truth(split$test)),}
\text{ \quad split = rep(c("train", "predict"), lengths(split))}
\text{)}
\text{boxplot(y ~ split, data = data)}
\]
# classification task
task = tsk("pima")
split = partition(task)

# roughly same distribution of the target label
prop.table(table(task$truth()))
prop.table(table(task$truth(split$train)))
prop.table(table(task$truth(split$test)))

# splitting into 3 disjunct sets, using ResamplingCV and stratification
task = tsk("iris")
task$set.col.roles(task$target_names, add_to = "stratum")
r = rsmp("cv", folds = 3)$instantiate(task)
sets = lapply(1:3, r$train_set)
lengths(sets)
prop.table(table(task$truth(sets[[1]])))

predict.Learner  

**Predict Method for Learners**

**Description**

Extends the generic `stats::predict()` with a method for Learner. Note that this function is intended as glue code to be used in third party packages. We recommend to work with the Learner directly, i.e. calling `learner$predict()` or `learner$predict.newdata()` directly.

Performs the following steps:

- Sets additional hyperparameters passed to this function.
- Creates a Prediction object by calling `learner$predict.newdata()`.
- Returns (subset of) Prediction.

**Usage**

```r
## S3 method for class 'Learner'
predict(object, newdata, predict_type = NULL, ...)
```

**Arguments**

- `object` *(Learner)*
  
  Any Learner.

- `newdata` *(data.frame())*
  
  New data to predict on.

- `predict_type` *(character(1))*
  
  The predict type to return. Set to `<Prediction>` to retrieve the complete Prediction object. If set to `NULL` (default), the first predict type for the respective class of the Learner as stored in `mlr_reflections` is used.
... (any) Hyperparameters to pass down to the Learner.

Examples

```r
task = tsk("spam")
learner = lrn("classif.rpart", predict_type = "prob")
learner$train(task)
predict(learner, task$data(1:3), predict_type = "response")
predict(learner, task$data(1:3), predict_type = "prob")
predict(learner, task$data(1:3), predict_type = "<Prediction>")
```

---

**Prediction**

**Abstract Prediction Object**

**Description**

This is the abstract base class for task objects like `PredictionClassif` or `PredictionRegr`.

Prediction objects store the following information:

1. The row ids of the test set
2. The corresponding true (observed) response.
3. The corresponding predicted response.
4. Additional predictions based on the class and predict_type. E.g., the class probabilities for classification or the estimated standard error for regression.

Note that this object is usually constructed via a derived classes, e.g. `PredictionClassif` or `PredictionRegr`.

**S3 Methods**

- `as.data.table(rr)`
  ```r
  Prediction -> data.table::data.table()
  ```
  Converts the data to a `data.table::data.table()`.

- `c(..., keep_duplicates = TRUE)`
  ```r
  (Prediction, Prediction, ...) -> Prediction
  ```
  Combines multiple Predictions to a single Prediction. If keep_duplicates is FALSE and there are duplicated row ids, the data of the former passed objects get overwritten by the data of the later passed objects.

**Public fields**

- `data (named list())`
  Internal data structure.

- `task_type (character())`
  Required type of the Task.
task_properties (character())
   Required properties of the Task.

predict_types (character())
   Set of predict types this object stores.

man (character(1))
   String in the format [pkg]:[topic] pointing to a manual page for this object. Defaults to
   NA, but can be set by child classes.

Active bindings
row_ids (integer())
   Vector of row ids for which predictions are stored.

truth (any)
   True (observed) outcome.

missing (integer())
   Returns row_ids for which the predictions are missing or incomplete.

Methods

Public methods:
   • Prediction$format()
   • Prediction$print()
   • Prediction$help()
   • Prediction$score()
   • Prediction$filter()
   • Prediction$clone()

Method format(): Helper for print outputs.

Usage:
   Prediction$format(...)

Arguments:
   ... (ignored).

Method print(): Printer.

Usage:
   Prediction$print(...)

Arguments:
   ... (ignored).

Method help(): Opens the corresponding help page referenced by field $man.

Usage:
   Prediction$help()
Method `score()`: Calculates the performance for all provided measures. `Task` and `Learner` may be `NULL` for most measures, but some measures need to extract information from these objects. Note that the `predict_sets` of the measures are ignored by this method, instead all predictions are used.

Usage:
```r
Prediction$score(
  measures = NULL,
  task = NULL,
  learner = NULL,
  train_set = NULL
)
```

Arguments:
- `measures` (`Measure` | list of `Measure`): Measure(s) to calculate.
- `task` (`Task`).
- `learner` (`Learner`).
- `train_set` (`integer()`).

Returns: `Prediction`.

Method `filter()`: Filters the `Prediction`, keeping only predictions for the provided `row_ids`. This changes the object in-place, you need to create a clone to preserve the original `Prediction`.

Usage:
```r
Prediction$filter(row_ids)
```

Arguments:
- `row_ids` (`integer()`): Row indices.

Returns: `self`, modified.

Method `clone()`: The objects of this class are cloneable with this method.

Usage:
```r
Prediction$clone(deep = FALSE)
```

Arguments:
- `deep` Whether to make a deep clone.

See Also
- Package `mlr3viz` for some generic visualizations.
- Extension packages for additional task types:
  - `mlr3proba` for probabilistic supervised regression and survival analysis.
  - `mlr3cluster` for unsupervised clustering.

Other Prediction: `PredictionClassif`, `PredictionRegr`
**Description**

This object wraps the predictions returned by a learner of class `LearnerClassif`, i.e. the predicted response and class probabilities.

If the response is not provided during construction, but class probabilities are, the response is calculated from the probabilities: the class label with the highest probability is chosen. In case of ties, a label is selected randomly.

**Thresholding**

If probabilities are stored, it is possible to change the threshold which determines the predicted class label. Usually, the label of the class with the highest predicted probability is selected. For binary classification problems, such an threshold defaults to 0.5. For cost-sensitive or imbalanced classification problems, manually adjusting the threshold can increase the predictive performance.

- For binary problems only a single threshold value can be set. If the probability exceeds the threshold, the positive class is predicted. If the probability equals the threshold, the label is selected randomly.
- For binary and multi-class problems, a named numeric vector of thresholds can be set. The length and names must correspond to the number of classes and class names, respectively. To determine the class label, the probabilities are divided by the threshold. This results in a ratio > 1 if the probability exceeds the threshold, and a ratio < 1 otherwise. Note that it is possible that either none or multiple ratios are greater than 1 at the same time. Anyway, the class label with maximum ratio is selected. In case of ties in the ratio, one of the tied class labels is selected randomly.

Note that there are the following edge cases for threshold equal to 0 which are handled specially:

1. With threshold 0 the resulting ratio gets Inf and thus gets always selected. If there are multiple ratios with value Inf, one is selected according to `ties_method` (randomly per default).
2. If additionally the predicted probability is also 0, the ratio 0/0 results in NaN values. These are simply replaced by 0 and thus will never get selected.

**Super class**

`mlr3::Prediction` -> `PredictionClassif`

**Active bindings**

- `response` (factor())
  - Access to the stored predicted class labels.
- `prob` (matrix())
  - Access to the stored probabilities.
confusion (matrix())

Confusion matrix, as resulting from the comparison of truth and response. Truth is in columns, predicted response is in rows.

Methods

Public methods:

- PredictionClassif$new()
- PredictionClassif$set_threshold()
- PredictionClassif$clone()

Method new(): Creates a new instance of this R6 class.

Usage:
PredictionClassif$new(
  task = NULL,
  row_ids = task$row_ids,
  truth = task$truth(),
  response = NULL,
  prob = NULL,
  check = TRUE
)

Arguments:

- task (TaskClassif)
  Task, used to extract defaults for row_ids and truth.
- row_ids (integer())
  Row ids of the predicted observations, i.e. the row ids of the test set.
- truth (factor())
  True (observed) labels. See the note on manual construction.
- response (character() | factor())
  Vector of predicted class labels. One element for each observation in the test set. Character vectors are automatically converted to factors. See the note on manual construction.
- prob (matrix())
  Numeric matrix of posterior class probabilities with one column for each class and one row for each observation in the test set. Columns must be named with class labels, row names are automatically removed. If prob is provided, but response is not, the class labels are calculated from the probabilities using max.col() with ties.method set to "random".
- check (logical(1))
  If TRUE, performs some argument checks and predict type conversions.

Method set_threshold(): Sets the prediction response based on the provided threshold. See the section on thresholding for more information.

Usage:
PredictionClassif$set_threshold(threshold, ties_method = "random")

Arguments:

- threshold (numeric()).
ties_method (character(1))
   One of "random", "first" or "last" (c.f. max.col()) to determine how to deal with tied probabilities.

Returns: Returns the object itself, but modified by reference. You need to explicitly $clone() the object beforehand if you want to keeps the object in its previous state.

Method clone(): The objects of this class are cloneable with this method.

Usage:
PredictionClassif$clone(deep = FALSE)

Arguments:
  deep Whether to make a deep clone.

Note
If this object is constructed manually, make sure that the factor levels for truth have the same levels as the task, in the same order. In case of binary classification tasks, the positive class label must be the first level.

See Also
• Package mlr3viz for some generic visualizations.
• Extension packages for additional task types:
  – mlr3proba for probabilistic supervised regression and survival analysis.
  – mlr3cluster for unsupervised clustering.

Other Prediction: Prediction, PredictionRegr

Examples

  task = tsk("penguins")
  learner = lrn("classif.rpart", predict_type = "prob")
  learner$train(task)
  p = learner$predict(task)
  p$predict_types
  head(as.data.table(p))

  # confusion matrix
  p$confusion

  # change threshold
  th = c(0.05, 0.9, 0.05)
  names(th) = task$class_names

  # new predictions
  p$set_threshold(th)$response
  p$score(measures = msr("classif.ce"))
Description

Objects of type PredictionData serve as an intermediate representation for objects of type Prediction. It is an internal data structure, implemented to optimize runtime and solve some issues emerging while serializing R6 objects. End-users typically do not need to worry about the details, package developers are advised to continue reading for some technical information.

Unlike most other mlr3 objects, PredictionData relies on the S3 class system. The following operations must be supported to extend mlr3 for new task types:

- `as_prediction_data()` converts objects to class PredictionData, e.g. objects of type Prediction.
- `as_prediction()` converts objects to class Prediction, e.g. objects of type PredictionData.
- `check_prediction_data()` is called on the return value of the predict method of a Learner to perform assertions and type conversions. Returns an update object of class PredictionData.
- `is_missing_prediction_data()` is used for the fallback learner (see Learner) to impute missing predictions. Returns vector with row ids which need imputation.

Usage

```r
check_prediction_data(pdata, ...)

is_missing_prediction_data(pdata, ...)

filter_prediction_data(pdata, row_ids, ...)

## S3 method for class 'PredictionDataClassif'
check_prediction_data(pdata, train_task, ...)

## S3 method for class 'PredictionDataClassif'
is_missing_prediction_data(pdata, ...)

## S3 method for class 'PredictionDataClassif'
c(..., keep_duplicates = TRUE)

## S3 method for class 'PredictionDataRegr'
check_prediction_data(pdata, ...)

## S3 method for class 'PredictionDataRegr'
is_missing_prediction_data(pdata, ...)

## S3 method for class 'PredictionDataRegr'
c(..., keep_duplicates = TRUE)
```
PredictionRegr

Arguments

pdata (PredictionData)
Named list inheriting from "PredictionData".

... (one or more PredictionData objects).

row_ids integer()
Row indices.

train_task (Task)
Task used for training the learner.

keep_duplicates (logical(1)) If TRUE, the combined PredictionData object is filtered for duplicated row ids (starting from last).

Description

This object wraps the predictions returned by a learner of class LearnerRegr, i.e. the predicted response and standard error. Additionally, probability distributions implemented in package distr6 are supported.

Super class

mlr3::Prediction -> PredictionRegr

Active bindings

response (numeric())
Access the stored predicted response.

se (numeric())
Access the stored standard error.

distr (VectorDistribution)

Methods

Public methods:

- PredictionRegr$new()
- PredictionRegr$clone()

Method new(): Creates a new instance of this R6 class.

Usage:
PredictionRegr$new(
  task = NULL,
  row_ids = task$row_ids,
  truth = task$truth(),
  response = NULL,
  se = NULL,
  distr = NULL,
  check = TRUE
)

Arguments:

- **task** (*TaskRegr*)
  Task, used to extract defaults for row_ids and truth.

- **row_ids** (*integer*)
  Row ids of the predicted observations, i.e. the row ids of the test set.

- **truth** (*numeric*)
  True (observed) response.

- **response** (*numeric*)
  Vector of numeric response values. One element for each observation in the test set.

- **se** (*numeric*)
  Numeric vector of predicted standard errors. One element for each observation in the test set.

- **distr** (*VectorDistribution*)
  VectorDistribution from package distr6 (in repository https://raphaels1.r-universe.dev). Each individual distribution in the vector represents the random variable 'survival time' for an individual observation.

- **check** (*logical(1)*)
  If TRUE, performs some argument checks and predict type conversions.

Method clone(): The objects of this class are cloneable with this method.

Usage:

```r
PredictionRegr$clone(deep = FALSE)
```

Arguments:

- **deep**
  Whether to make a deep clone.

See Also

- Package mlr3viz for some generic visualizations.
- Extension packages for additional task types:
  - mlr3proba for probabilistic supervised regression and survival analysis.
  - mlr3cluster for unsupervised clustering.

Other Prediction: Prediction, PredictionClassif
Examples

```r
task = tsk("boston_housing")
learner = lrn("regr.featureless", predict_type = "se")
p = learner$train(task)$predict(task)
p$predict_types
head(as.data.table(p))
```

---

resample  

Resample a Learner on a Task

Description

Runs a resampling (possibly in parallel): Repeatedly apply Learner learner on a training set of Task task to train a model, then use the trained model to predict observations of a test set. Training and test sets are defined by the Resampling resampling.

Usage

```r
resample(
  task, 
  learner, 
  resampling, 
  store_models = FALSE, 
  store_backends = TRUE, 
  encapsulate = NA_character_, 
  allow_hotstart = FALSE, 
  clone = c("task", "learner", "resampling")
)
```

Arguments

- **task** *(Task).*
- **learner** *(Learner).*
- **resampling** *(Resampling).*
- **store_models** *(logical(1))*
  - Store the fitted model in the resulting object= Set to TRUE if you want to further analyse the models or want to extract information like variable importance.
- **store_backends** *(logical(1))*
  - Keep the DataBackend of the Task in the ResampleResult? Set to TRUE if your performance measures require a Task, or to analyse results more conveniently. Set to FALSE to reduce the file size and memory footprint after serialization. The current default is TRUE, but this eventually will be changed in a future release.
- **encapsulate** *(character(1))*
  - If not NA, enables encapsulation by setting the field Learner$encapsulate to one of the supported values: "none" (disable encapsulation), "try" (captures
errors but output is printed to the console and not logged), "evaluate" (execute via \texttt{evaluate}) and "callr" (start in external session via \texttt{callr}). If NA, encapsulation is not changed, i.e. the settings of the individual learner are active. Additionally, if encapsulation is set to "evaluate" or "callr", the fallback learner is set to the featureless learner if the learner does not already have a fallback configured.

\texttt{allow\_hotstart} (\texttt{logical(1)})

Determines if learner(s) are hot started with trained models in \$\texttt{hotstart\_stack}. See also \texttt{HotstartStack}.

\texttt{clone} (\texttt{character()})

Select the input objects to be cloned before proceeding by providing a set with possible values "task", "learner" and "resampling" for \texttt{Task}, \texttt{Learner} and \texttt{Resampling}, respectively. Per default, all input objects are cloned.

\textbf{Value}

\texttt{ResampleResult}.

\textbf{Predict Sets}

If you want to compare the performance of a learner on the training with the performance on the test set, you have to configure the \texttt{Learner} to predict on multiple sets by setting the field \texttt{predict\_sets} to c("train", "test") (default is "test"). Each set yields a separate \texttt{Prediction} object during resampling. In the next step, you have to configure the measures to operate on the respective Prediction object:

\begin{verbatim}
m1 = msr("classif.ce", id = "ce.train", predict_sets = "train")
m2 = msr("classif.ce", id = "ce.test", predict_sets = "test")
\end{verbatim}

The (list of) created measures can finally be passed to \$\texttt{aggregate()} or \$\texttt{score}().

\textbf{Parallelization}

This function can be parallelized with the \texttt{future} package. One job is one resampling iteration, and all jobs are send to an apply function from \texttt{future.apply} in a single batch. To select a parallel backend, use \texttt{future::plan()}.

\textbf{Progress Bars}

This function supports progress bars via the package \texttt{progressr}. Simply wrap the function call in \texttt{progressr::with\_progress()} to enable them. Alternatively, call \texttt{progressr::handlers()} with \texttt{global = TRUE} to enable progress bars globally. We recommend the \texttt{progress} package as backend which can be enabled with \texttt{progressr::handlers("progress")}.

\textbf{Logging}

The \texttt{mlr3} uses the \texttt{lgr} package for logging. \texttt{lgr} supports multiple log levels which can be queried with \texttt{getOption("lgr.log\_levels")}.

To suppress output and reduce verbosity, you can lower the log from the default level "info" to "warn":

\texttt{Sys.setenv(LGR_LOG_LEVELS="warn")}
lgr::get_logger("mlr3")$set_threshold("warn")

To get additional log output for debugging, increase the log level to "debug" or "trace":

lgr::get_logger("mlr3")$set_threshold("debug")

To log to a file or a data base, see the documentation of lgr::lgr-package.

Note

The fitted models are discarded after the predictions have been computed in order to reduce memory consumption. If you need access to the models for later analysis, set store_models to TRUE.

See Also

- as_benchmark_result() to convert to a BenchmarkResult.
- Package mlr3viz for some generic visualizations.

Other resample: ResampleResult

Examples

task = tsk("penguins")
learner = lrn("classif.rpart")
resampling = rsmp("cv")

# Explicitly instantiate the resampling for this task for reproducibility
set.seed(123)
resampling$instantiate(task)

rr = resample(task, learner, resampling)
print(rr)

# Retrieve performance
rr$score(msr("classif.ce"))
rr$aggregate(msr("classif.ce"))

# merged prediction objects of all resampling iterations
pred = rr$prediction()
pred$confusion

# Repeat resampling with featureless learner
rr_featureless = resample(task, lrn("classif.featureless"), resampling)

# Convert results to BenchmarkResult, then combine them
bmr1 = as_benchmark_result(rr)
bmr2 = as_benchmark_result(rr_featureless)
print(bmr1$combine(bmr2))
Description

This is the result container object returned by `resample()`.

Note that all stored objects are accessed by reference. Do not modify any object without cloning it first.

`ResampleResult` can be visualized via `mlr3viz`'s `autoplot()` function.

S3 Methods

- `as.data.table(rr, reassemble_learners = TRUE, convert_predictions = TRUE, predict_sets = "test")`
  `ResampleResult` -> `data.table::data.table()`
  Returns a tabular view of the internal data.

- `c(...)`
  `(ResampleResult, ...) -> BenchmarkResult`
  Combines multiple objects convertible to `BenchmarkResult` into a new `BenchmarkResult`.

Active bindings

- `task_type (character(1))`
  Task type of objects in the `ResampleResult`, e.g. "classif" or "regr". This is NA for empty `ResampleResults`.

- `uhash (character(1))`
  Unique hash for this object.

- `iters (integer(1))`
  Number of resampling iterations stored in the `ResampleResult`.

- `task (Task)`
  The task `resample()` operated on.

- `learner (Learner)`
  Learner prototype `resample()` operated on. For a list of `trained` learners, see methods `$learners()`.

- `resampling (Resampling)`
  Instantiated `Resampling` object which stores the splits into training and test.

- `learners (list of Learner)`
  List of trained learners, sorted by resampling iteration.

- `warnings (data.table::data.table())`
  A table with all warning messages. Column names are "iteration" and "msg". Note that there can be multiple rows per resampling iteration if multiple warnings have been recorded.

- `errors (data.table::data.table())`
  A table with all error messages. Column names are "iteration" and "msg". Note that there can be multiple rows per resampling iteration if multiple errors have been recorded.
Methods

**Public methods:**

- `ResampleResult$new()`
- `ResampleResult$format()`
- `ResampleResult$print()`
- `ResampleResult$help()`
- `ResampleResult$prediction()`
- `ResampleResult$predictions()`
- `ResampleResult$score()`
- `ResampleResult$aggregate()`
- `ResampleResult$filter()`
- `ResampleResult$discard()`
- `ResampleResult$clone()`

**Method** `new()`: Creates a new instance of this R6 class. An alternative construction method is provided by `as_resample_result()`.

*Usage:*

```r
ResampleResult$new(data = ResultData$new(), view = NULL)
```

*Arguments:*

- `data` *(ResultData | data.table())*
  
  An object of type `ResultData`, either extracted from another `ResampleResult`, another `BenchmarkResult`, or manually constructed with `as_result_data()`.

- `view` *(character())*
  
  Single uhash of the `ResultData` to operate on. Used internally for optimizations.

**Method** `format()`: Helper for print outputs.

*Usage:*

```r
ResampleResult$format(...)```

*Arguments:*

- `...` *(ignored).*

**Method** `print()`: Printer.

*Usage:*

```r
ResampleResult$print(...)```

*Arguments:*

- `...` *(ignored).*

**Method** `help()`: Opens the corresponding help page referenced by field `$man`.

*Usage:*

```r
ResampleResult$help()```
Method prediction(): Combined Prediction of all individual resampling iterations, and all provided predict sets. Note that, per default, most performance measures do not operate on this object directly, but instead on the prediction objects from the resampling iterations separately, and then combine the performance scores with the aggregate function of the respective Measure (macro averaging).

If you calculate the performance on this prediction object directly, this is called micro averaging.

Usage:
```
ResampleResult$prediction(predict_sets = "test")
```

Arguments:
- predict_sets (character())

Returns: Prediction. Subset of \{"train", "test"\}.

Method predictions(): List of prediction objects, sorted by resampling iteration. If multiple sets are given, these are combined to a single one for each iteration.

If you evaluate the performance on all of the returned prediction objects and then average them, this is called macro averaging. For micro averaging, operate on the combined prediction object as returned by $prediction().

Usage:
```
ResampleResult$predictions(predict_sets = "test")
```

Arguments:
- predict_sets (character())

Returns: List of Prediction objects, one per element in predict_sets.

Method score(): Returns a table with one row for each resampling iteration, including all involved objects: Task, Learner, Resampling, iteration number (integer(1)), and Prediction. Additionally, a column with the individual (per resampling iteration) performance is added for each Measure in measures, named with the id of the respective measure id. If measures is NULL, measures defaults to the return value of default_measures().

Usage:
```
ResampleResult$score(
  measures = NULL,
  ids = TRUE,
  conditions = FALSE,
  predict_sets = "test"
)
```

Arguments:
- measures (Measure | list of Measure)
  Measure(s) to calculate.
- ids (logical(1))
  If ids is TRUE, extra columns with the ids of objects("task_id", "learner_id", "resampling_id") are added to the returned table. These allow to subset more conveniently.
conditions (logical(1))
   Adds condition messages ("warnings", "errors") as extra list columns of character vectors to the returned table
predict_sets (character())
   Vector of predict sets ("train", "test") to construct the Prediction objects from. Default is "test".
Returns: data.table::data.table().

Method aggregate(): Calculates and aggregates performance values for all provided measures, according to the respective aggregation function in Measure. If measures is NULL, measures defaults to the return value of default_measures().
   Usage:
   ResampleResult$aggregate(measures = NULL)
   Arguments:
   measures (Measure | list of Measure)
      Measure(s) to calculate.
   Returns: Named numeric().

Method filter(): Subsets the ResampleResult, reducing it to only keep the iterations specified in iters.
   Usage:
   ResampleResult$filter(iters)
   Arguments:
   iters (integer())
      Resampling iterations to keep.
   Returns: Returns the object itself, but modified by reference. You need to explicitly $clone() the object beforehand if you want to keeps the object in its previous state.

Method discard(): Shrinks the ResampleResult by discarding parts of the internally stored data. Note that certain operations might stop work, e.g. extracting importance values from learners or calculating measures requiring the task’s data.
   Usage:
   ResampleResult$discard(backends = FALSE, models = FALSE)
   Arguments:
   backends (logical(1))
      If TRUE, the DataBackend is removed from all stored Tasks.
   models (logical(1))
      If TRUE, the stored model is removed from all Learners.
   Returns: Returns the object itself, but modified by reference. You need to explicitly $clone() the object beforehand if you want to keeps the object in its previous state.

Method clone(): The objects of this class are cloneable with this method.
   Usage:
   ResampleResult$clone(deep = FALSE)
   Arguments:
   deep Whether to make a deep clone.
Resampling

See Also
- `as_benchmark_result()` to convert to a BenchmarkResult.
- Package mlr3viz for some generic visualizations.

Other resample: `resample()`

Examples

```r
task = tsk("penguins")
learner = lrn("classif.rpart")
resampling = rsmpl("cv", folds = 3)
rr = resample(task, learner, resampling)
print(rr)

# combined predictions and predictions for each fold separately
rr$prediction()
rr$predictions()

# folds scored separately, then aggregated (macro)
rr$aggregate(msr("classif.acc"))

# predictions first combined, then scored (micro)
rr$prediction()$score(msr("classif.acc"))

# check for warnings and errors
rr$warnings
rr$errors
```

Resampling

Resampling Class

Description

This is the abstract base class for resampling objects like ResamplingCV and ResamplingBootstrap. The objects of this class define how a task is partitioned for resampling (e.g., in `resample()` or `benchmark()`), using a set of hyperparameters such as the number of folds in cross-validation.

Resampling objects can be instantiated on a Task, which applies the strategy on the task and manifests in a fixed partition of row_ids of the Task.

Predefined resamplings are stored in the dictionary mlr_resamplings, e.g. cv or bootstrap.

Stratification

All derived classes support stratified sampling. The stratification variables are assumed to be discrete and must be stored in the Task with column role "stratum". In case of multiple stratification variables, each combination of the values of the stratification variables forms a strata.
First, the observations are divided into subpopulations based on one or multiple stratification variables (assumed to be discrete), c.f. \texttt{task$\text{strata}()}.

Second, the sampling is performed in each of the $k$ subpopulations separately. Each subgroup is divided into $\text{iter}$ training sets and $\text{iter}$ test sets by the derived \texttt{Resampling}. These sets are merged based on their iteration number: all training sets from all subpopulations with iteration 1 are combined, then all training sets with iteration 2, and so on. Same is done for all test sets. The merged sets can be accessed via $\text{train\_set}(i)$ and $\text{test\_set}(i)$, respectively. Note that this procedure can lead to set sizes that are slightly different from those without stratification.

\textbf{Grouping / Blocking}

All derived classes support grouping of observations. The grouping variable is assumed to be discrete and must be stored in the \texttt{Task} with column role "group".

Observations in the same group are treated like a "block" of observations which must be kept together. These observations either all go together into the training set or together into the test set.

The sampling is performed by the derived \texttt{Resampling} on the grouping variable. Next, the grouping information is replaced with the respective row ids to generate training and test sets. The sets can be accessed via $\text{train\_set}(i)$ and $\text{test\_set}(i)$, respectively.

\textbf{Public fields}

\texttt{label (character(1))}

Label for this object. Can be used in tables, plot and text output instead of the ID.

\texttt{param\_set (paradox::ParamSet)}

Set of hyperparameters.

\texttt{instance (any)}

During \texttt{instantiate()}, the instance is stored in this slot in an arbitrary format. Note that if a grouping variable is present in the \texttt{Task}, a \texttt{Resampling} may operate on the group ids internally instead of the row ids (which may lead to confusion).

It is advised to not work directly with the instance, but instead only use the getters $\text{train\_set}(i)$ and $\text{test\_set}(i)$.

\texttt{task\_hash (character(1))}

The hash of the \texttt{Task} which was passed to \texttt{r$\text{instantiate}()$}.

\texttt{task\_nrow (integer(1))}

The number of observations of the \texttt{Task} which was passed to \texttt{r$\text{instantiate}()$}.

\texttt{duplicated\_ids (logical(1))}

If \texttt{TRUE}, duplicated rows can occur within a single training set or within a single test set. E.g., this is \texttt{TRUE} for Bootstrap, and \texttt{FALSE} for cross-validation. Only used internally.

\texttt{man (character(1))}

String in the format \texttt{[pkg]::[topic]} pointing to a manual page for this object. Defaults to \texttt{NA}, but can be set by child classes.

\textbf{Active bindings}

\texttt{id (character(1))}

Identifier of the object. Used in tables, plot and text output.
is_instantiated (logical(1))
    Is TRUE if the resampling has been instantiated.

hash (character(1))
    Hash (unique identifier) for this object.

Methods

Public methods:

- Resampling$new()
- Resampling$formatter()
- Resampling$print()
- Resampling$help()
- Resampling$instantiate()
- Resampling$train_set()
- Resampling$test_set()
- Resampling$clone()

Method new(): Creates a new instance of this R6 class.

Usage:
Resampling$new(
    id,
    param_set = ps(),
    duplicated_ids = FALSE,
    label = NA_character_,
    man = NA_character_,
)

Arguments:
id (character(1))
    Identifier for the new instance.
param_set (paradox::ParamSet)
    Set of hyperparameters.
duplicated_ids (logical(1))
    Set to TRUE if this resampling strategy may have duplicated row ids in a single training set
    or test set.
    Note that this object is typically constructed via a derived classes, e.g. ResamplingCV or
    ResamplingHoldout.
label (character(1))
    Label for the new instance.
man (character(1))
    String in the format [pkg]::[topic] pointing to a manual page for this object. The referenced help package can be opened via method $help().

Method format(): Helper for print outputs.

Usage:
Resampling$format(...)
Arguments:
... (ignored).

**Method print()**: Printer.

*Usage:*
Resampling$print(...)
*Arguments:*
... (ignored).

**Method help()**: Opens the corresponding help page referenced by field $man.

*Usage:*
Resampling$help()

**Method instantiate()**: Materializes fixed training and test splits for a given task and stores them in r$instance in an arbitrary format.

*Usage:*
Resampling$instantiate(task)
*Arguments:*
task (Task)
  Task used for instantiation.

*Returns*: Returns the object itself, but modified by reference. You need to explicitly $clone() the object beforehand if you want to keeps the object in its previous state.

**Method train_set()**: Returns the row ids of the i-th training set.

*Usage:*
Resampling$train_set(i)
*Arguments:*
i (integer(1))
  Iteration.

*Returns*: (integer()) of row ids.

**Method test_set()**: Returns the row ids of the i-th test set.

*Usage:*
Resampling$test_set(i)
*Arguments:*
i (integer(1))
  Iteration.

*Returns*: (integer()) of row ids.

**Method clone()**: The objects of this class are cloneable with this method.

*Usage:*
Resampling$clone(deep = FALSE)
*Arguments:*
deep  Whether to make a deep clone.

Other Resampling: mlr_resamplings, mlr_resamplings_bootstrap, mlr_resamplings_custom, mlr_resamplings_custom_cv, mlr_resamplings_cv, mlr_resamplings_holdout, mlr_resamplings_insample, mlr_resamplings_loo, mlr_resamplings_repeated_cv, mlr_resamplings_subsampling

Examples

```r
r = rsmp("subsampling")
# Default parametrization
r$param_set$values

# Do only 3 repeats on 10% of the data
r$param_set$values = list(ratio = 0.1, repeats = 3)

# Instantiate on penguins task
task = tsk("penguins")
r$instantiate(task)

# Extract train/test sets
train_set = r$train_set(1)
print(train_set)
intersect(train_set, r$test_set(1))

# Another example: 10-fold CV
r = rsmp("cv")$instantiate(task)
r$train_set(1)

# Stratification
task = tsk("pima")
prop.table(table(task$truth())) # moderately unbalanced
task$col_roles$stratum = task$target_names

r = rsmp("subsampling")
r$instantiate(task)
prop.table(table(task$truth(r$train_set(1)))) # roughly same proportion
```
Description

Control the parallelism via threading while calling external packages from mlr3.

For example, the random forest implementation in package ranger (connected via mlr3learners) supports threading via OpenMP. The number of threads to use can be set via hyperparameter num.threads, and defaults to 1. By calling set_threads(x, 4) with x being a ranger learner, the hyperparameter is changed so that 4 cores are used.

If the object x does not support threading, x is returned as-is. If applied to a list, recurses through all list elements.

Note that threading is incompatible with other parallelization techniques such as forking via the future::plan future::multicore. For this reason all learners connected to mlr3 have threading disabled in their defaults.

Usage

set_threads(x, n = availableCores(), ...)

## Default S3 method:
set_threads(x, n = availableCores(), ...)

## S3 method for class 'R6'
set_threads(x, n = availableCores(), ...)

## S3 method for class 'list'
set_threads(x, n = availableCores(), ...)

Arguments

x (any)
Object to set threads for, e.g. a Learner. This object is modified in-place.

n (integer(1))
Number of threads to use. Defaults to parallelly::availableCores().

... (any)
Additional arguments.

Value

Same object as input x (changed in-place), with possibly updated parameter values.
Task

<table>
<thead>
<tr>
<th>Task</th>
<th>Task Class</th>
</tr>
</thead>
</table>

Description

This is the abstract base class for TaskSupervised and TaskUnsupervised. TaskClassif and TaskRegr inherit from TaskSupervised. More supervised tasks are implemented in mlr3proba, unsupervised cluster tasks in package mlr3cluster.

Tasks serve two purposes:

1. Tasks wrap a DataBackend, an object to transparently interface different data storage types.
2. Tasks store meta-information, such as the role of the individual columns in the DataBackend.

For example, for a classification task a single column must be marked as target column, and others as features.

Predefined (toy) tasks are stored in the dictionary mlr_tasks, e.g. penguins or boston_housing. More toy tasks can be found in the dictionary after loading mlr3data.

S3 methods

- as.data.table(t)
  Task -> data.table::data.table()
  Returns the complete data as data.table::data.table().

- head(t)
  Calls head() on the task’s data.

- summary(t)
  Calls summary() on the task’s data.

Task mutators

The following methods change the task in-place:

- Any modification of the lists $col_roles or $row_roles. This provides a different "view" on the data without altering the data itself.
- Modification of column or row roles via $set_col_roles() or $set_row_roles(), respectively.
- $filter() and $select() subset the set of active rows or features in $row_roles or $col_roles, respectively. This provides a different "view" on the data without altering the data itself.
- rbind() and cbind() change the task in-place by binding rows or columns to the data, but without modifying the original DataBackend. Instead, the methods first create a new DataBackendDataTable from the provided new data, and then merge both backends into an abstract DataBackend which merges the results on-demand.
- rename() wraps the DataBackend of the Task in an additional DataBackend which deals with the renaming. Also updates $col_roles and $col_info.
- set_levels() and droplevels() update the field col_info'.
Public fields

- **label** (character(1))
  Label for this object. Can be used in tables, plot and text output instead of the ID.

- **task_type** (character(1))
  Task type, e.g. "classif" or "regr".
  For a complete list of possible task types (depending on the loaded packages), see `mlr_reflections$task_types$type`.

- **backend** (DataBackend)
  Abstract interface to the data of the task.

- **col_info** (data.table::data.table())
  Table with 4 columns:
  - "id" (character()) stores the name of the column.
  - "type" (character()) holds the storage type of the variable, e.g. integer, numeric or character. See `mlr_reflections$task_feature_types` for a complete list of allowed types.
  - "levels" (list()) stores a vector of distinct values (levels) for ordered and unordered factor variables.
  - "label" (character()) stores a vector of prettier, formatted column names.
  - "fix_factor_levels" (logical()) stores flags which determine if the levels of the respective variable need to be reordered after querying the data from the DataBackend.

- **man** (character(1))
  String in the format [pkg]::[topic] pointing to a manual page for this object. Defaults to NA, but can be set by child classes.

- **extra_args** (named list())
  Additional arguments set during construction. Required for `convert_task()`.

- **mlr3_version** (package_version)
  Package version of mlr3 used to create the task.

Active bindings

- **id** (character(1))
  Identifier of the object. Used in tables, plot and text output.

- **hash** (character(1))
  Hash (unique identifier) for this object.

- **row_ids** (positive integer())
  Returns the row ids of the DataBackend for observations with role "use".

- **row_names** (data.table::data.table())
  Returns a table with two columns:
  - "row_id" (integer()), and
  - "row_name" (character()).

- **feature_names** (character())
  Returns all column names with role == "feature".
  Note that this vector determines the default order of columns for `task$data(cols = NULL, ...)` However, it is recommended to not rely on the order of columns, but instead always address columns by their name. The default order is not well defined after some operations, e.g. after `task$cbind()` or after processing via `mlr3pipelines`. 
target_names (character())
  Returns all column names with role "target".

properties (character())
  Set of task properties. Possible properties are are stored in mlr_reflections$task_properties.
  The following properties are currently standardized and understood by tasks in mlr3:
  • "strata": The task is resampled using one or more stratification variables (role "stratum").
  • "groups": The task comes with grouping/blocking information (role "group").
  • "weights": The task comes with observation weights (role "weight").

  Note that above listed properties are calculated from the $col_roles and may not be set explicitly.

row_roles (named list())
  Each row (observation) can have an arbitrary number of roles in the learning task:
  • "use": Use in train / predict / resampling.
  • "test": Observations are hold back unless explicitly queried. Can be queried by a Learner to determine a good iteration to stop by evaluating the performance on external data, e.g. the XGboost learner in mlr3learners for parameter nrounds.
  • "holdout": Observations are hold back unless explicitly queried. Can be used, e.g., as truly independent holdout set:
    1. Add "holdout" to the predict_sets of a Learner.
    2. Configure a Measure to use the "holdout" set by updating its predict_sets field.

row_roles is a named list whose elements are named by row role and each element is an integer() vector of row ids. To alter the roles, just modify the list, e.g. with R’s set functions (intersect(), setdiff(), union(), ...).

col_roles (named list())
  Each column can be in one or more of the following groups to fulfill different roles:
  • "feature": Regular feature used in the model fitting process.
  • "target": Target variable. Most tasks only accept a single target column.
  • "name": Row names / observation labels. To be used in plots. Can be queried with $row_names. Not more than a single column can be associated with this role.
  • "order": Data returned by $data() is ordered by this column (or these columns). Columns must be sortable with order().
  • "group": During resampling, observations with the same value of the variable with role "group" are marked as "belonging together". For each resampling iteration, observations of the same group will be exclusively assigned to be either in the training set or in the test set. Not more than a single column can be associated with this role.
  • "stratum": Stratification variables. Multiple discrete columns may have this role.
  • "weight": Observation weights. Not more than one numeric column may have this role.

col_roles is a named list whose elements are named by column role and each element is a character() vector of column names. To alter the roles, just modify the list, e.g. with R’s set functions (intersect(), setdiff(), union(), ...). The method $set_col_roles provides a convenient alternative to assign columns to roles.

nrow (integer(1))
  Returns the total number of rows with role "use".
ncol (integer(1))
    Returns the total number of columns with role "target" or "feature".

feature_types (data.table::data.table())
    Returns a table with columns id and type where id are the column names of "active" features of the task and type is the storage type.

data_formats character()
    Vector of supported data output formats. A specific format can be chosen in the $data() method.

strata (data.table::data.table())
    If the task has columns designated with role "stratum", returns a table with one subpopulation per row and two columns:
    • N(integer()) with the number of observations in the subpopulation, and
    • row_id (list of integer()) as list column with the row ids in the respective subpopulation. Returns NULL if there are is no stratification variable. See Resampling for more information on stratification.

groups (data.table::data.table())
    If the task has a column with designated role "group", a table with two columns:
    • row_id (integer()), and
    • grouping variable group (vector()).
    Returns NULL if there are is no grouping column. See Resampling for more information on grouping.

order (data.table::data.table())
    If the task has at least one column with designated role "order", a table with two columns:
    • row_id (integer()), and
    • ordering vector order (integer()).
    Returns NULL if there are is no order column.

weights (data.table::data.table())
    If the task has a column with designated role "weight", a table with two columns:
    • row_id (integer()), and
    • observation weights weight (numeric()).
    Returns NULL if there are is no weight column.

labels (named character())
    Retrieve labels (prettier formatted names) from columns. Internally queries the column label of the table in field col_info. Columns ids referenced by the name of the vector, the labels are the actual string values.
    Assigning to this column update the task by reference. You have to provide a character vector of labels, named with column ids. To remove a label, set it to NA. Alternatively, you can provide a data.frame() with the two columns "id" and "label".

col_hashes (named character)
    Hash (unique identifier) for all columns except the primary_key: A character vector, named by the columns that each element refers to.
    Columns of different Tasks or DataBackends that have agreeing col_hashes always represent the same data, given that the same rows are selected. The reverse is not necessarily true: There can be columns with the same content that have different col_hashes.
Methods

Public methods:

• Task$new()
• Task$help()
• Task$format()
• Task$print()
• Task$data()
• Task$formula()
• Task$head()
• Task$levels()
• Task$missings()
• Task$filter()
• Task$select()
• Task$rbind()
• Task$cbind()
• Task$rename()
• Task$set_row_roles()
• Task$set_col_roles()
• Task$set_levels()
• Task$droplevels()
• Task$add_strata()
• Task$clone()

Method new(): Creates a new instance of this R6 class.

Usage:
Task$new(id, task_type, backend, label = NA_character_, extra_args = list())

Arguments:
  id (character(1))
  Identifier for the new instance.
  task_type (character(1))
  Type of task, e.g. "regr" or "classif". Must be an element of mlr_reflections$task_types$type.
  backend (DataBackend)
  Either a DataBackend, or any object which is convertible to a DataBackend with as_data_backend().
  E.g., a data.frame() will be converted to a DataBackendDataTable.
  label (character(1))
  Label for the new instance.
  extra_args (named list())
  Named list of constructor arguments, required for converting task types via convert_task().

Method help(): Opens the corresponding help page referenced by field $man.

Usage:
Task$help()
Method `format()`: Helper for print outputs.

Usage:
```
Task$format(...)  
```

Arguments:
... (ignored).

Method `print()`: Printer.

Usage:
```
Task$print(...)  
```

Arguments:
... (ignored).

Method `data()`: Returns a slice of the data from the DataBackend in the data format specified by `data_format`. Rows default to observations with role "use", and columns default to features with roles "target" or "feature". If rows or cols are specified which do not exist in the DataBackend, an exception is raised.

Rows and columns are returned in the order specified via the arguments `rows` and `cols`. If rows is `NULL`, rows are returned in the order of `task$row_ids`. If cols is `NULL`, the column order defaults to `c(task$target_names, task$feature_names)`. Note that it is recommended to **not** rely on the order of columns, and instead always address columns with their respective column name.

Usage:
```
Task$data(  
  rows = NULL,  
  cols = NULL,  
  data_format = "data.table",  
  ordered = FALSE  
)  
```

Arguments:
- `rows` (positive integer())
  Vector or row indices.
- `cols` (character())
  Vector of column names.
- `data_format` (character(1))
  Desired data format, e.g. "data.table" or "Matrix".
- `ordered` (logical(1))
  If TRUE, data is ordered according to the columns with column role "order".

Returns: Depending on the DataBackend, but usually a `data.table::data.table()`.

Method `formula()`: Constructs a formula, e.g. `[target] ~ [feature_1] + [feature_2] + ... + [feature_k]`, using the features provided in argument `rhs` (defaults to all columns with role "feature", symbolized by ".").

Note that it is currently not possible to change the formula. However, **mlr3pipelines** provides a pipe operator interfacing `stats::model.matrix()` for this purpose: "modelmatrix".

Usage:
Task$formula(rhs = ".")

Arguments:

rhs (character(1))

Right hand side of the formula. Defaults to "." (all features of the task).

Returns: formula().

Method head(): Get the first n observations with role "use" of all columns with role "target" or "feature".

Usage:

Task$head(n = 6L)

Arguments:

n (integer(1)).

Returns: data.table::data.table() with n rows.

Method levels(): Returns the distinct values for columns referenced in cols with storage type "factor" or "ordered". Argument cols defaults to all such columns with role "target" or "feature".

Note that this function ignores the row roles, it returns all levels available in the DataBackend. To update the stored level information, e.g. after subsetting a task with $filter(), call $droplevels().

Usage:

Task$levels(cols = NULL)

Arguments:

cols (character())

Vector of column names.

Returns: named list().

Method missings(): Returns the number of missing observations for columns referenced in cols. Considers only active rows with row role "use". Argument cols defaults to all columns with role "target" or "feature".

Usage:

Task$missings(cols = NULL)

Arguments:

cols (character())

Vector of column names.

Returns: Named integer().

Method filter(): Subsets the task, keeping only the rows specified via row ids rows.

This operation mutates the task in-place. See the section on task mutators for more information.

Usage:

Task$filter(rows)

Arguments:
rows (positive integer())
   Vector or row indices.

Returns: Returns the object itself, but modified by reference. You need to explicitly $clone() the object beforehand if you want to keeps the object in its previous state.

Method select(): Subsets the task, keeping only the features specified via column names cols.
Note that you cannot deselect the target column, for obvious reasons.
This operation mutates the task in-place. See the section on task mutators for more information.

Usage:
Task$select(cols)
Arguments:
cols (character())
   Vector of column names.

Returns: Returns the object itself, but modified by reference. You need to explicitly $clone() the object beforehand if you want to keeps the object in its previous state.

Method rbind(): Adds additional rows to the DataBackend stored in $backend. New row ids are automatically created, unless data has a column whose name matches the primary key of the DataBackend (task$backend$primary_key). In case of name clashes of row ids, rows in data have higher precedence and virtually overwrite the rows in the DataBackend.
All columns with the roles "target", "feature", "weight", "group", "stratum", and "order" must be present in data. Columns only present in data but not in the DataBackend of task will be discarded.
This operation mutates the task in-place. See the section on task mutators for more information.

Usage:
Task$rbind(data)
Arguments:
data (data.frame()).

Returns: Returns the object itself, but modified by reference. You need to explicitly $clone() the object beforehand if you want to keeps the object in its previous state.

Method cbind(): Adds additional columns to the DataBackend stored in $backend.
The row ids must be provided as column in data (with column name matching the primary key name of the DataBackend). If this column is missing, it is assumed that the rows are exactly in the order of $row_ids. In case of name clashes of column names in data and DataBackend, columns in data have higher precedence and virtually overwrite the columns in the DataBackend.
This operation mutates the task in-place. See the section on task mutators for more information.

Usage:
Task$cbind(data)
Arguments:
data (data.frame()).

Method rename(): Renames columns by mapping column names in old to new column names in new (element-wise).
This operation mutates the task in-place. See the section on task mutators for more information.
**Usage:**

Task$rename(old, new)

**Arguments:**

- **old** (character())
  - Old names.
- **new** (character())
  - New names.

**Returns:** Returns the object itself, but modified by reference. You need to explicitly $clone() the object beforehand if you want to keep the object in its previous state.

**Method set_row_roles():** Modifies the roles in $row_roles in-place.

**Usage:**

Task$set_row_roles(rows, roles = NULL, add_to = NULL, remove_from = NULL)

**Arguments:**

- **rows** (integer())
  - Row ids for which to change the roles for.
- **roles** (character())
  - Exclusively set rows to the specified roles (remove from other roles).
- **add_to** (character())
  - Add rows with row ids rows to roles specified in add_to. Rows keep their previous roles.
- **remove_from** (character())
  - Remove rows with row ids rows from roles specified in remove_from. Other row roles are preserved.

**Details:** Roles are first set exclusively (argument roles), then added (argument add_to) and finally removed (argument remove_from) from different roles.

**Returns:** Returns the object itself, but modified by reference. You need to explicitly $clone() the object beforehand if you want to keep the object in its previous state.

**Method set_col_roles():** Modifies the roles in $col_roles in-place.

**Usage:**

Task$set_col_roles(cols, roles = NULL, add_to = NULL, remove_from = NULL)

**Arguments:**

- **cols** (character())
  - Column names for which to change the roles for.
- **roles** (character())
  - Exclusively set columns to the specified roles (remove from other roles).
- **add_to** (character())
  - Add columns with column names cols to roles specified in add_to. Columns keep their previous roles.
- **remove_from** (character())
  - Remove columns with column names cols from roles specified in remove_from. Other column roles are preserved.

**Details:** Roles are first set exclusively (argument roles), then added (argument add_to) and finally removed (argument remove_from) from different roles.
Returns: Returns the object itself, but modified by reference. You need to explicitly $clone() the object beforehand if you want to keep the object in its previous state.

Method set_levels(): Set levels for columns of type factor and ordered in field col_info. You can add, remove or reorder the levels, affecting the data returned by $data() and $levels(). If you just want to remove unused levels, use $droplevels() instead.

Note that factor levels which are present in the data but not listed in the task as valid levels are converted to missing values.

Usage:
Task$set_levels(levels)

Arguments:
levels (named list() of character())
  List of character vectors of new levels, named by column names.

Returns: Modified self.

Method droplevels(): Updates the cache of stored factor levels, removing all levels not present in the current set of active rows. cols defaults to all columns with storage type "factor" or "ordered".

Usage:
Task$droplevels(cols = NULL)

Arguments:
cols (character())
  Vector of column names.

Returns: Modified self.

Method add_strata(): Cuts numeric variables into new factors columns which are added to the task with role "stratum". This ensures that all training and test splits contain observations from all bins. The columns are named "..stratum_[col_name]".

Usage:
Task$add_strata(cols, bins = 3L)

Arguments:
cols (character())
  Names of columns to operate on.
bins (integer())
  Number of bins to cut into (passed to cut() as breaks). Replicated to have the same length as cols.

Returns: self (invisibly).

Method clone(): The objects of this class are cloneable with this method.

Usage:
Task$clone(deep = FALSE)

Arguments:
deep Whether to make a deep clone.

  - Probabilistic supervised regression and survival analysis: https://mlr3proba.mlr-org.com/

Other Task: TaskClassif, TaskRegr, TaskSupervised, TaskUnsupervised, mlr_tasks, mlr_tasks_boston_housing, mlr_tasks_breast_cancer, mlr_tasks_german_credit, mlr_tasks_iris, mlr_tasks_mtcars, mlr_tasks_penguins, mlr_tasks_pima, mlr_tasks_sonar, mlr_tasks_spam, mlr_tasks_wine, mlr_tasks_zoo

Examples

# We use the inherited class TaskClassif here,
# because the base class `Task` is not intended for direct use
task = TaskClassif$new("penguins", palmerpenguins::penguins, target = "species")

  task$nrow
task$ncol
task$feature_names
task$formula()  

  # de-select "year"
task$select(setdiff(task$feature_names, "year"))

  task$feature_names

  # Add new column "foo"
task$cbind(data.frame(foo = 1:344))
head(task)

---

**TaskClassif**  
*Classification Task*
TaskClassif

Description
This task specializes Task and TaskSupervised for classification problems. The target column is assumed to be a factor or ordered factor. The task_type is set to "classif".

Additional task properties include:
- "twoclass": The task is a binary classification problem.
- "multiclass": The task is a multiclass classification problem.

It is recommended to use as_task_classif() for construction. Predefined tasks are stored in the dictionary mlr_tasks.

Super classes

mlr3::Task -> mlr3::TaskSupervised -> TaskClassif

Active bindings

class_names (character())
Returns all class labels of the target column.

positive (character())
Stores the positive class for binary classification tasks, and NA for multiclass tasks. To switch the positive class, assign a level to this field.

negative (character())
Stores the negative class for binary classification tasks, and NA for multiclass tasks.

Methods

Public methods:
- TaskClassif$new()
- TaskClassif$truth()
- TaskClassif$droplevels()
- TaskClassif$clone()

Method new(): Creates a new instance of this R6 class. The function as_task_classif() provides an alternative way to construct classification tasks.

Usage:
TaskClassif$new(
  id,
  backend,
  target,
  positive = NULL,
  label = NA_character_,
  extra_args = list()
)

Arguments:
- id (character(1))
  Identifier for the new instance.
backend (DataBackend)
   Either a DataBackend, or any object which is convertible to a DataBackend with as_data_backend().
   E.g., a data.frame() will be converted to a DataBackendDataTable.

target (character(1))
   Name of the target column.

positive (character(1))
   Only for binary classification: Name of the positive class. The levels of the target columns
   are reordered accordingly, so that the first element of $class_names is the positive class,
   and the second element is the negative class.

label (character(1))
   Label for the new instance.

extra_args (named list())
   Named list of constructor arguments, required for converting task types via convert_task().

Method truth(): True response for specified row_ids. Format depends on the task type.
   Defaults to all rows with role "use".

Usage:
   TaskClassif$truth(rows = NULL)

Arguments:
   rows (positive integer())
      Vector or row indices.

Returns: factor().

Method droplevels(): Updates the cache of stored factor levels, removing all levels not present
   in the current set of active rows. cols defaults to all columns with storage type "factor" or "ordered".
   Also updates the task property "twoclass"/"multiclass".

Usage:
   TaskClassif$droplevels(cols = NULL)

Arguments:
   cols (character())
      Vector of column names.

Returns: Modified self.

Method clone(): The objects of this class are cloneable with this method.

Usage:
   TaskClassif$clone(deep = FALSE)

Arguments:
   deep Whether to make a deep clone.

TaskGenerator  

TaskGenerator Class

Description

Creates a Task of arbitrary size. Predefined task generators are stored in the dictionary `mlr_task_generators`, e.g. `xor`.

Public fields

`id` (character(1))
  Identifier of the object. Used in tables, plot and text output.

`label` (character(1))
  Label for this object. Can be used in tables, plot and text output instead of the ID.

`task_type` (character(1))
  Task type, e.g. "classif" or "regr". For a complete list of possible task types (depending on the loaded packages), see `mlr_reflections$task_types$type`.
param_set (paradox::ParamSet)
  Set of hyperparameters.
packages (character(1))
  Set of required packages. These packages are loaded, but not attached.
man (character(1))
  String in the format [pkg]:[topic] pointing to a manual page for this object. Defaults to NA, but can be set by child classes.

Methods

Public methods:

- TaskGenerator$new()
- TaskGenerator$format()
- TaskGenerator$print()
- TaskGenerator$generate()
- TaskGenerator$clone()

Method new(): Creates a new instance of this R6 class.

Usage:

TaskGenerator$new(
  id,
  task_type,
  packages = character(),
  param_set = ps(),
  label = NA_character_,
  man = NA_character_,
)

Arguments:

id (character(1))
  Identifier for the new instance.

task_type (character(1))
  Type of task, e.g. "regr" or "classif". Must be an element of mlr_reflections$task_types$type.

packages (character())
  Set of required packages. A warning is signaled by the constructor if at least one of the packages is not installed, but loaded (not attached) later on-demand via requireNamespace().

param_set (paradox::ParamSet)
  Set of hyperparameters.

label (character(1))
  Label for the new instance.

man (character(1))
  String in the format [pkg]:[topic] pointing to a manual page for this object. The referenced help package can be opened via method $help().

Method format(): Helper for print outputs.

Usage:
TaskGenerator

TaskGenerator$format(...)

**Arguments:**
... (ignored).

**Method** print(): Printer.

**Usage:**
TaskGenerator$print(...)

**Arguments:**
... (ignored).

**Method** generate(): Creates a task of type task_type with \( n \) observations, possibly using additional settings stored in param_set.

**Usage:**
TaskGenerator$generate(n)

**Arguments:**
\( n \) (integer(1))
  Number of rows to generate.

**Returns:** Task.

**Method** clone(): The objects of this class are cloneable with this method.

**Usage:**
TaskGenerator$clone(deep = FALSE)

**Arguments:**
deep Whether to make a deep clone.

**See Also**

Other TaskGenerator: mlr_task_generators, mlr_task_generators_2dnormals, mlr_task_generators_cassini, mlr_task_generators_circle, mlr_task_generators_friedman1, mlr_task_generators_moons, mlr_task_generators_simplex, mlr_task_generators_smiley, mlr_task_generators_spirals, mlr_task_generators_xor
Description

This task specializes Task and TaskSupervised for regression problems. The target column is assumed to be numeric. The task_type is set to "regr".

It is recommended to use as_task_regr() for construction. Predefined tasks are stored in the dictionary mlr_tasks.

Super classes

mlr3::Task -> mlr3::TaskSupervised -> TaskRegr

Methods

Public methods:

• TaskRegr$new()
• TaskRegr$truth()
• TaskRegr$clone()

Method new(): Creates a new instance of this R6 class. The function as_task_regr() provides an alternative way to construct regression tasks.

Usage:
TaskRegr$new(id, backend, target, label = NA_character_, extra_args = list())

Arguments:

id (character(1))
  Identifier for the new instance.
backend (DataBackend)
  Either a DataBackend, or any object which is convertible to a DataBackend with as_data_backend(). E.g., a data.frame() will be converted to a DataBackendDataTable.
target (character(1))
  Name of the target column.
label (character(1))
  Label for the new instance.
extra_args (named list())
  Named list of constructor arguments, required for converting task types via convert_task().

Method truth(): True response for specified row_ids. Format depends on the task type. Defaults to all rows with role "use".

Usage:
TaskRegr$truth(rows = NULL)

Arguments:
TaskRegr

rows (positive integer())
Vector or row indices.

Returns: numeric().

Method clone(): The objects of this class are cloneable with this method.

Usage:
TaskRegr$clone(deep = FALSE)

Arguments:
depth Whether to make a deep clone.
