Package ‘osrm’

January 24, 2022

Type Package

Title Interface Between R and the OpenStreetMap-Based Routing Service

OSRM

Version 3.5.1

Description An interface between R and the 'OSRM' API. 'OSRM' is a routing

service based on 'OpenStreetMap' data. See <http://project-osrm.org/> for more

information. This package allows to compute routes, trips, isochrones and

travel distances matrices (travel time and kilometric distance).

License GPL-3

Imports jsonlite, curl, utils, stats, isoband, methods,
googlePolylines, sf

Depends R (>= 3.5.0)

Suggests mapsf, lwgeom, tinytest, covr, sp

Shortest Paths and Travel Time from OpenStreetMap via an OSRM API

Description

An interface between R and the OSRM API. OSRM is a routing service based on OpenStreetMap data. See <http://project-osrm.org/> for more information. This package allows to compute routes, trips, isochrones and travel distances matrices (travel time and kilometric distance).

- `osrmTable` Get travel time matrices between points.
- `osrmRoute` Get the shortest path between two points.
- `osrmTrip` Get the travel geometry between multiple unordered points.
- `osrmIsochrone` Get polygons of isochrones.

Note

This package relies on the usage of a running OSRM service (tested with version 5.26.0 of the OSRM API).

To set the OSRM server, change the `osrm.server` option:
```r
options(osrm.server = "http://address.of.the.server/")
```

To set the profile, use the `osrm.profile` option:
```r
options(osrm.profile = "name.of.the.profile")
```
The "car" profile is set by default. Other possible profiles are "foot" and "bike".

A typical setup, corresponding to the Docker example, would be:
```r
options(osrm.server = "http://0.0.0.0:5000/", osrm.profile = "car")
```

The package ships a sample dataset of 100 random pharmacies in Berlin (© OpenStreetMap contributors - https://www.openstreetmap.org/copyright/en).

The sf dataset uses the projection WGS 84 / UTM zone 34N (EPSG:32634).

The csv dataset uses WGS 84 (EPSG:4326).
osrmIsochrone  Get Polygons of Isochrones

Description

Based on osrmTable, this function builds polygons of isochrones.

Usage

osrmIsochrone(
  loc,
  breaks = seq(from = 0, to = 60, length.out = 7),
  exclude = NULL,
  res = 30,
  returnclass = "sf",
  osrm.server = getOption("osrm.server"),
  osrm.profile = getOption("osrm.profile")
)

Arguments

loc a numeric vector of longitude and latitude (WGS84), an sf object of the origin point.
breaks a numeric vector of isochrone values (in minutes).
exclude pass an optional "exclude" request option to the OSRM API.
res number of points used to compute isochrones, one side of the square grid, the total number of points will be res*res.
returnclass class of the returned polygons.
osrm.server the base URL of the routing server. getOption("osrm.server") by default.
osrm.profile the routing profile to use, e.g. "car", "bike" or "foot" (when using the routing.openstreetmap.de test server). getOption("osrm.profile") by default.

Value

An sf MULTIPOLYGON of isochrones is returned. The data frame of the output contains four fields: id (id of each polygon), min and max (minimum and maximum breaks of the polygon), center (central values of classes).

Examples

## Not run:
# Load data
library(sf)
apotheke.sf <- st_read(system.file("gpkg/apotheke.gpkg", package = "osrm"),
quiet = TRUE)
# Get isochones with lon/lat coordinates
iso <- osrmIsochrone(loc = c(13.43, 52.47), breaks = seq(0, 14, 2),
returnclass="sf")
plot(st_geometry(iso), col = c("grey80", "grey60", "grey50",
"grey40", "grey30", "grey20"))
# Map
if(require("mapsf")){
  breaks <- sort(c(unique(iso$min), max(iso$max)))
  mapsf::mf_map(x = iso, var = "center", type = "choro",
    breaks = breaks, pal = "Greens",
    border = NA, leg_pos = "topleft",
    leg_frame = TRUE, leg_title = "Isochrones (min)")
}
# Get isochones with an sf POINT
iso2 <- osrmIsochrone(loc = apotheke.sf[10,], returnclass="sf",
  breaks = seq(from = 0, to = 16, by = 2))
# Map
if(require("mapsf")){
  breaks2 <- sort(c(unique(iso2$min), max(iso2$max)))
  mapsf::mf_map(x = iso2, var = "center", type = "choro",
    breaks = breaks2, pal = "Blues",
    border = NA, leg_pos = "topleft", leg_val_rnd = 0,
    leg_frame = TRUE, leg_title = "Isochrones (min)")
}
## End(Not run)

osrmIsometric

Get Polygons of Isodistances

Description

Based on osrmTable, this function builds polygons of isometric road distances.

Usage

osrmIsometric(
  loc,  
  breaks = seq(from = 0, to = 10000, length.out = 4),
  exclude = NULL,
  res = 30,
  returnclass = "sf",
)
osrmRoute

osrm.server = getOption("osrm.server"),
osrm.profile = getOption("osrm.profile")
)

Arguments

loc a numeric vector of longitude and latitude (WGS84), an sf object of the origine point.
breaks a numeric vector of isometric values (in meters).
exclude pass an optional "exclude" request option to the OSRM API.
res number of points used to compute isochrones, one side of the square grid, the total number of points will be res*res.
returnclass class of the returned polygons.
osrm.server the base URL of the routing server. getOption("osrm.server") by default.
osrm.profile the routing profile to use, e.g. "car", "bike" or "foot" (when using the routing.openstreetmap.de test server). getOption("osrm.profile") by default.

Value

An sf MULTIPOLYGON of isochrones is returned. The data frame of the output contains four fields: id (id of each polygon), min and max (minimum and maximum breaks of the polygon), center (central values of classes).

# Get isochones with lon/lat coordinates
iso <- osrmIsometric(loc = c(13.43,52.47), breaks = c(0,100,200, 500, 1000),
returnclass="sf")
plot(st_geometry(iso))
## End(Not run)

---

**osrmRoute**  
*Get the Shortest Path Between Two Points*

**Description**

Build and send an OSRM API query to get the travel geometry between two points. This function interfaces the route OSRM service.
Usage

osrmRoute(
  src,
  dst,
  loc,
  overview = "simplified",
  exclude = NULL,
  returnclass,
  osrm.server = getOption("osrm.server"),
  osrm.profile = getOption("osrm.profile")
)

Arguments

src
  a vector of identifier, longitude and latitude (WGS84), a vector of longitude and
  latitude (WGS84) or an sf object of the origine point.
dst
  a vector of identifier, longitude and latitude (WGS84), a vector of longitude and
  latitude (WGS84) or an sf object of the destination point.
loc
  a data.frame of identifier, longitude and latitude (WGS84) or an sf object of via
  points. The first row is the origine, the last row is the destination.
overview
  "full", "simplified" or FALSE. Use "full" to return the detailed geometry, use
  "simplified" to return a simplified geometry, use FALSE to return only time and
  distance.
exclude
  pass an optional "exclude" request option to the OSRM API.
returnclass
  if returnclass="sf" an sf LINESTRING is returned. If returnclass is not set a
  data.frame of coordinates is returned.
osrm.server
  the base URL of the routing server. getOption("osrm.server") by default.
osrm.profile
  the routing profile to use, e.g. "car", "bike" or "foot" (when using the rout-
  ing.openstreetmap.de test server). getOption("osrm.profile") by default.

Value

If returnclass is not set, a data frame is returned. It contains the longitudes and latitudes of the travel
path between the two points.
If returnclass is set to "sf", an sf LINESTRING is returned.
The sf LINESTRING contains 4 fields: identifiers of origine and destination, travel time in minutes
and travel distance in kilometers.

If overview is FALSE, a named numeric vector is returned. It contains travel time (in minutes)
and travel distance (in kilometers).

Examples

## Not run:
library(sf)
apotheke.df <- read.csv(system.file("csv/apotheke.csv", package = "osrm"))
apotheke.sf <- st_read(system.file("gpkg/apotheke.gpkg", package = "osrm"),
## osrmTable

Get Travel Time Matrices Between Points

```r
quiet = TRUE)

# Travel path between points
route1 <- osrmRoute(src = apotheke.sf[1,], dst = apotheke.df[16,],
                    returnclass="sf")

# Display paths
plot(st_geometry(route1))
plot(st_geometry(apotheke.sf[c(1,16),]), col = "red", pch = 20, add = TRUE)

# Return only duration and distance
route3 <- osrmRoute(src = apotheke.sf[1,], dst = apotheke.df[16,],
                    overview = FALSE)
route3

# Using only coordinates
route4 <- osrmRoute(src = c(13.412, 52.502),
                    dst = c(13.454, 52.592),
                    returnclass = "sf")
plot(st_geometry(route4))

# Using via points
pts <- structure(
  list(x = c(13.32500, 13.30688, 13.30519, 13.31025,
       y = c(52.40566, 52.44491, 52.52084, 52.59318, 52.61063, 52.55317,
            52.50186, 52.49468, 52.46441, 52.39669)),
  class = "data.frame", row.names = c(NA, -10L))
route5 <- osrmRoute(loc = pts, returnclass = "sf")
plot(st_geometry(route5), col = "red", lwd = 2)
points(pts, pch = 20, cex = 2)

# Using a different routing server
u <- "https://routing.openstreetmap.de/routed-foot/
route5 <- osrmRoute(apotheke.sf[1,], apotheke.df[16,], returnclass="sf",
            osrm.server = u)

# Using an open routing service with support for multiple modes
# see https://github.com/riatelab/osrm/issues/67
options(osrm.server = u)
route6 <- osrmRoute(apotheke.sf[1,], apotheke.df[16,], returnclass="sf",
            osrm.profile = "bike")
route7 <- osrmRoute(apotheke.sf[1,], apotheke.df[16,], returnclass="sf",
            osrm.profile = "car")
plot(st_geometry(route5), col = "green")
plot(st_geometry(route6), add = TRUE) # note the cycle route has fewer turns
plot(st_geometry(route7), col = "red", add = TRUE) # car route, indirect = good!
```

## osrmTable

Get Travel Time Matrices Between Points
Description

Build and send OSRM API queries to get travel time matrices between points. This function interfaces the table OSRM service.

Usage

osrmTable(
  loc,
  src = NULL,
  dst = NULL,
  exclude = NULL,
  gepaf = FALSE,
  measure = "duration",
  osrm.server = getOption("osrm.server"),
  osrm.profile = getOption("osrm.profile")
)

Arguments

loc a data frame containing 3 fields: points identifiers, longitudes and latitudes (WGS84). It can also be an sf object. If so, row names are used as identifiers. If loc parameter is used, all pair-wise distances are computed.
src a data frame containing origin points identifiers, longitudes and latitudes (WGS84). It can also be an sf object. If so, row names are used as identifiers. If dst and src parameters are used, only pairs between src/dst are computed.
dst a data frame containing destination points identifiers, longitudes and latitudes (WGS84). It can also be an sf object. If so, row names are used as identifiers.
exclude pass an optional "exclude" request option to the OSRM API.
gepaf a boolean indicating if coordinates are sent encoded with the google encoded algorithm format (TRUE) or not (FALSE). Must be FALSE if using the public OSRM API.
measure a character indicating what measures are calculated. It can be "duration" (in minutes), "distance" (meters), or both c('duration', 'distance'). The demo server only allows "duration".
osrm.server the base URL of the routing server. getOption("osrm.server") by default.
osrm.profile the routing profile to use, e.g. "car", "bike" or "foot" (when using the routing.openstreetmap.de test server). getOption("osrm.profile") by default.

Details

If loc, src or dst are data frames we assume that the 3 first columns of the data.frame are: identifiers, longitudes and latitudes.

Value

A list containing 3 data frames is returned. durations is the matrix of travel times (in minutes), sources and destinations are the coordinates of the origin and destination points actually used to compute the travel times (WGS84).
Note

If you want to get a large number of distances make sure to set the "max-table-size" argument (Max. locations supported in table) of the OSRM server accordingly.

osrmIsochrone

Examples

```r
## Not run:
# Inputs are data frames
apotheke.df <- read.csv(system.file("csv/apotheke.csv", package = "osrm"))
# Travel time matrix
distA <- osrmTable(loc = apotheke.df[1:50, c("id","lon","lat")])
# First 5 rows and columns
distA$durations[1:5,1:5]

# Travel time matrix with different sets of origins and destinations
distA2 <- osrmTable(src = apotheke.df[1:10,c("id","lon","lat")],
               dst = apotheke.df[11:20,c("id","lon","lat")])
# First 5 rows and columns
distA2$durations[1:5,1:5]

# Inputs are sf points
library(sf)
apotheke.sf <- st_read(system.file("gpkg/apotheke.gpkg", package = "osrm"),
           quiet = TRUE)
distA3 <- osrmTable(loc = apotheke.sf[1:10,])
# First 5 rows and columns
distA3$durations[1:5,1:5]

# Travel time matrix with different sets of origins and destinations
distA4 <- osrmTable(src = apotheke.sf[1:10,], dst = apotheke.sf[11:20,])
# First 5 rows and columns
distA4$durations[1:5,1:5]

## End(Not run)
```

osrmTrip

Get the Travel Geometry Between Multiple Unordered Points

Description

Build and send an OSRM API query to get the shortest travel geometry between multiple points. This function interfaces the trip OSRM service.
Usage

```r
osrmTrip(
  loc, 
  exclude = NULL, 
  overview = "simplified", 
  returnclass = "sf", 
  osrm.server = getOption("osrm.server"), 
  osrm.profile = getOption("osrm.profile")
)
```

Arguments

- `loc`: an sf object of the waypoints, or a data.frame with points as rows and 3 columns: identifier, longitudes and latitudes (WGS84 decimal degrees).
- `exclude`: pass an optional "exclude" request option to the OSRM API.
- `overview`: "full", "simplified". Add geometry either full (detailed) or simplified according to highest zoom level it could be display on.
- `returnclass`: if returnclass="sf" an sf LINESTRING is returned.
- `osrm.server`: the base URL of the routing server. getOption("osrm.server") by default.
- `osrm.profile`: the routing profile to use, e.g. "car", "bike" or "foot" (when using the routing.openstreetmap.de test server). getOption("osrm.profile") by default.

Details

As stated in the OSRM API, if input coordinates can not be joined by a single trip (e.g. the coordinates are on several disconnecte islands) multiple trips for each connected component are returned.

Value

A list of connected components. Each component contains:

- `trip`: An sf LINESTRING (loc’s CRS if there is one, WGS84 if not) containing a line for each step of the trip.
- `summary`: A list with 2 components: duration (in minutes) and distance (in kilometers).

See Also

- `osrmRoute`

Examples

```r
## Not run:
library(sf)
apotheke.sf <- st_read(system.file("gpkg/apotheke.gpkg", package = "osrm"), quiet = TRUE)
# Get a trip with a set of points (sf POINT)
trips <- osrmTrip(loc = apotheke.sf[1:5, ], returnclass = "sf")
mytrip <- trips[[1]]$trip
```
# Display the trip
plot(st_geometry(mytrip), col = "black", lwd = 4)
plot(st_geometry(mytrip), col = c("red", "white"), lwd = 1, add = TRUE)
plot(st_geometry(apotheke.sf), pch = 21, bg = "red", cex = 1, add = TRUE)

## End(Not run)
