

# Package ‘planr’

September 16, 2023

**Title** Tools for Supply Chain Management, Demand and Supply Planning

**Version** 0.1.1

**Description** Perform flexible and quick calculations for Demand and Supply Planning, such as projected inventories and coverages, as well as replenishment plan. For any time bucket, daily, weekly or monthly, and any granularity level, product or group of products.

**License** MIT + file LICENSE

**Encoding** UTF-8

**RoxygenNote** 7.2.2

**Imports** dplyr, magrittr, RcppRoll

**URL** <https://github.com/nguyennico/planr>

**BugReports** <https://github.com/nguyennico/planr/issues>

**Depends** R (>= 2.10)

**LazyData** true

**Suggests** highcharter, knitr, lubridate, reactable, reactablefmtr, rmarkdown, shiny, tidyverse, sparkline, DT, DiagrammeR, networkD3, testthat (>= 3.0.0)

**VignetteBuilder** knitr

**Config/testthat/edition** 3

**NeedsCompilation** no

**Author** Nicolas Nguyen [aut, cre]

**Maintainer** Nicolas Nguyen <nikonguyen@yahoo.fr>

**Repository** CRAN

**Date/Publication** 2023-09-16 09:10:02 UTC

blueprint	<i>blueprint</i>
-----------	------------------

---

## Description

This dataset contains the basic features to calculate projected inventories and coverages and also 2 additional info: a minimum and maximum targets of stock coverage. We can apply on it the `proj_inv()` function, it will return calculated projected inventories and coverages as well as an analysis of the position of the projected inventories versus the minimum and maximum stocks targets.

## Usage

```
data(blueprint)
```

## Format

A data frame with 520 rows and 7 variables

## Details

- DFU, an item
- Period, a date
- Demand, a consumption in units
- Opening, available inventories at the beginning in units
- Supply, a Replenishment Plan in units
- Min.Cov, a Minimum Stocks Targets in number of Periods
- Max.Cov, a Maximum Stocks Targets in number of Periods

## Author(s)

Nicolas Nguyen <nikonguyen@yahoo.fr>

---

`blueprint_drp``blueprint_drp`

---

## Description

This dataset contains the basic features to calculate a Replenishment Plan (also called DRP) and its related projected inventories and coverages. We can apply on it the `drp()` function, it will return the calculated Replenishment Plan and its related projected inventories and coverages.

## Usage

```
data(blueprint_drp)
```

## Format

A data frame with 520 rows and 9 variables

## Details

- DFU, an item
- Period, a date
- Demand, a consumption in units
- Opening, available inventories at the beginning in units
- Supply, a Replenishment Plan in units
- FH, defines the Frozen and Free Horizon. It has 2 values: Frozen or Free. If Frozen : no calculation of Replenishment Plan yet, the calculation starts when the period is defined as Free. We can use this parameter to consider some defined productions plans or supplies (allocations, workorders,...) in the short-term for example.
- SSCov, the Safety Stock Coverage, expressed in number of periods
- DRPCovDur the Frequency of Supply, expressed in number of periods
- MOQ the Multiple Order Quantity, expressed in units, 1 by default or a Minimum Order Quantity

blueprint_light	<i>blueprint_light</i>
-----------------	------------------------

---

### Description

This dataset contains the basic features to calculate projected inventories and coverages. Just 5 features are needed for this: a DFU, a Period, a Demand, an initial Opening Inventory and a Supply Plan. We can apply on it the `light_proj_inv()` function, it will return calculated projected inventories and coverages.

### Usage

```
data(blueprint_light)
```

### Format

A data frame with 520 rows and 5 variables

### Details

- DFU, an item
- Period, a date
- Demand, a consumption in units
- Opening, available inventories at the beginning in units
- Supply, a Replenishment Plan in units

### Author(s)

Nicolas Nguyen <nikonguyen@yahoo.fr>

---

drp	<i>Calculates a Replenishment Plan (also called DRP : Distribution Requirement Planning) and the related Projected Inventories and Coverages</i>
-----	--

---

### Description

Calculates a Replenishment Plan (also called DRP : Distribution Requirement Planning) and the related Projected Inventories and Coverages

### Usage

```
drp(dataset, DFU, Period, Demand, Opening, Supply, SSCov, DRPCovDur, MOQ, FH)
```

**Arguments**

dataset	a dataframe with the demand and supply features for an item per period
DFU	name of an item, a SKU, or a node like an item x location
Period	a period of time monthly or weekly buckets for example
Demand	the quantity of an item planned to be consumed in units for a given period
Opening	the opening inventories of an item in units at the beginning of the horizon
Supply	the quantity of an item planned to be supplied in units for a given period
SSCov	the Safety Stock Coverage, expressed in number of periods
DRPCovDur	the Frequency of Supply, expressed in number of periods
MOQ	the Multiple Order Quantity, expressed in units, 1 by default or a multiple of a Minimum Order Quantity
FH	defines the Frozen and Free Horizon. It has 2 values: Frozen or Free. If Frozen : no calculation of Replenishment Plan yet, the calculation starts when the period is defined as Free. We can use this parameter to consider some defined productions plans or supplies (allocations, workorders,...) in the short-term for example.

**Value**

a dataframe with the calculated Replenishment Plan and related Projected inventories and Coverages

**Examples**

```
drp(dataset = blueprint_drp, DFU, Period, Demand, Opening, Supply, SSCov, DRPCovDur, MOQ, FH)
```

---

light_proj_inv	<i>Calculates projected inventories and coverages</i>
----------------	---

---

**Description**

Calculates projected inventories and coverages

**Usage**

```
light_proj_inv(dataset, DFU, Period, Demand, Opening, Supply)
```

**Arguments**

dataset	a dataframe with the demand and supply features for an item per period
DFU	name of an item, a SKU, or a node like an item x location
Period	a period of time monthly or weekly buckets for example
Demand	the quantity of an item planned to be consumed in units for a given period
Opening	the opening inventories of an item in units at the beginning of the horizon
Supply	the quantity of an item planned to be supplied in units for a given period

**Value**

a dataframe with the calculated projected inventories and coverages and the related analysis

**Examples**

```
light_proj_inv(dataset = blueprint_light, DFU, Period, Demand, Opening, Supply)
```

---

proj_inv	<i>Calculates projected inventories and coverages and perform an analysis vs stocks targets</i>
----------	---

---

**Description**

Calculates projected inventories and coverages and perform an analysis vs stocks targets

**Usage**

```
proj_inv(dataset, DFU, Period, Demand, Opening, Supply, Min.Cov, Max.Cov)
```

**Arguments**

dataset	a dataframe with the demand and supply features for an item per period
DFU	name of an item, a SKU, or a node like an item x location
Period	a period of time monthly or weekly buckets for example
Demand	the quantity of an item planned to be consumed in units for a given period
Opening	the opening inventories of an item in units at the beginning of the horizon
Supply	the quantity of an item planned to be supplied in units for a given period
Min.Cov	minimum stocks target of an item expressed in periods
Max.Cov	maximum stocks target of an item expressed in periods

**Value**

a dataframe with the calculated projected inventories and coverages and the related analysis

**Examples**

```
proj_inv(dataset = blueprint, DFU, Period, Demand, Opening, Supply, Min.Cov, Max.Cov)
```
