Package ‘qtlcharts’

August 6, 2021

Version 0.14
Date 2021-08-05
Title Interactive Graphics for QTL Experiments
Maintainer Karl W Broman <broman@wisc.edu>
Depends R (>= 2.15)
Imports qtl (>= 1.30-4), htmlwidgets, graphics, stats, utils
Suggests htmltools, jsonlite, knitr, devtools, roxygen2, rmarkdown, testthat
License GPL-3 | file LICENSE
BugReports https://github.com/kbroman/qtlcharts/issues
LazyData true
Encoding UTF-8
ByteCompile true
RoxygenNote 7.1.1
NeedsCompilation no
Description

A QTL is a *quantitative trait locus*: a genetic locus that contributes to variation in a quantitative trait. The goal of [R/qtlcharts](https://kbroman.org/qtlcharts/) is to provide interactive data visualizations for QTL analyses, and to make these visualizations available from R. It is a companion to the [R/qtl](https://rqt1.org) package.
cbindQTLeffects

Details

Vignettes online at the [R/qtlcharts website](https://kbroman.org/qtlcharts/):
- [User guide](https://kbroman.org/qtlcharts/assets/vignettes/userGuide.html)
- [Developer guide](https://kbroman.org/qtlcharts/assets/vignettes/devGuide.html)
- [Use with R Markdown](https://kbroman.org/qtlcharts/assets/vignettes/Rmarkdown.html)
- [List of chart customization options](https://kbroman.org/qtlcharts/assets/vignettes/chartOpts.html)

---

cbindQTLeffects  Combine multiple runs of estQTLeffects

Description

Combine multiple runs of estQTLeffects by applying `cbind` to each component.

Usage

```r
cbindQTLeffects(..., labels)
```

Arguments

- `...` Results of `estQTLeffects()`
- `labels` Vector of labels to use in the combination.

Value

A list of matrices; each component corresponds to a position in the genome and is a matrix with phenotypes x effects.

See Also

[estQTLeffects()]

Examples

```r
library(qtl)
data(fake.f2)
fake.f2 <- calc.genoprob(fake.f2)
sex <- fake.f2$pheno$sex
eff.fem <- estQTLeffects(fake.f2[, sex==0], pheno.col=1)
eff.mal <- estQTLeffects(fake.f2[, sex==1], pheno.col=1)
eff <- cbindQTLeffects(eff.fem, eff.mal, labels=c("female", "male"))
```
Description

Calculates the effects of QTL at each position across the genome using Haley-Knott regression, much like \[qtl::effectscan()\], but considering multiple phenotypes and not plotting the results.

Usage

\[
estQTLeffects(cross, pheno.col = 1, what = c("means", "effects"))
\]

Arguments

- `cross` (Optional) Object of class "cross", see \[qtl::read.cross()\].
- `pheno.col` Phenotype columns in cross object.
- `what` Indicates whether to calculate phenotype averages for each genotype group or to turn these into additive and dominance effects.

Details

One should first run \[qtl::calc.genoprob()\]; if not, it is run with the default arguments.

The estimated effects will be poorly estimated in the case of selective genotyping, as Haley-Knott regression performs poorly in this case.

Value

list of matrices; each component corresponds to a position in the genome and is a matrix with phenotypes x effects

See Also

\[iplotMScanone(), [qtl::effectscan()] [cbindQTLeffects()]\]

Examples

\[
data(grav)
l library(qtl)
grav <- reduce2grid(calc.genoprob(grav, step=1))
out <- estQTLeffects(grav, phe=seq(1, nphe(grav), by=5))
\]
geneExpr

---

Anonymized gene expression data

**Description**

An anonymized set of gene expression values, for 100 genes all influenced by a common locus, plus a vector of genotypes for the 491 individuals.

**Usage**

data(geneExpr)

**Format**

A list containing a matrix `expr` with the gene expression data plus a vector `genotype` with the genotypes.

**Author(s)**

Karl W Broman, 2013-05-16

**Examples**

data(geneExpr)

# heat map of correlation matrix, linked to scatterplots
iplotCorr(geneExpr$expr, geneExpr$genotype, reorder=TRUE)

---

grav

Arabidopsis QTL data on gravitropism

**Description**

Data from a QTL experiment on gravitropism in Arabidopsis, with data on 162 recombinant inbred lines (Ler x Cvi). The outcome is the root tip angle (in degrees) at two-minute increments over eight hours.

**Usage**

data(grav)

**Format**

An object of class `"cross"`; see `qtl::read.cross()`.
Source

Mouse Phenome Database, <https://phenome.jax.org/projects/Moore1b>

References

Examples

data(grav)
times <- attr(grav, "time")
phe <- grav$pheno

iplotCurves(phe, times, phe[,c(61,121)], phe[,c(121,181)],
  chartOpts=list(curves_xlab="Time (hours)", curves_ylab="Root tip angle (degrees)",
    scat1_xlab="Angle at 2 hrs", scat1_ylab="Angle at 4 hrs",
    scat2_xlab="Angle at 4 hrs", scat2_ylab="Angle at 6 hrs"))

iboxplot

Modern boxplot linked to underlying histograms

Description

Creates an interactive graph for a large set of box plots (rendered as lines connecting the quantiles), linked to underlying histograms.

Usage

iboxplot(
dat,
qu = c(0.001, 0.01, 0.1, 0.25),
orderByMedian = TRUE,
breaks = 251,
chartOpts = NULL,
digits = 5
)

Arguments

dat Data matrix (individuals x variables)
qu Quantiles to plot (All with 0 < qu < 0.5)
orderByMedian If TRUE, reorder individuals by their median
breaks Number of bins in the histograms, or a vector of locations of the breakpoints between bins (as in [graphics::hist()])
**iboxplot_output**

- **chartOpts**: A list of options for configuring the chart (see the coffeescript code). Each element must be named using the corresponding option.

- **digits**: Round data to this number of significant digits before passing to the chart function. (Use NULL to not round.)

**Value**

An object of class ‘htmlwidget’ that will intelligently print itself into HTML in a variety of contexts including the R console, within R Markdown documents, and within Shiny output bindings.

**See Also**

- `iplotCorr()`
- `scat2scat()`

**Examples**

```r
n.ind <- 500
n.gene <- 10000
expr <- matrix(rnorm(n.ind * n.gene, (1:n.ind)/n.ind*3), ncol=n.gene)
dimnames(expr) <- list(paste0("ind", 1:n.ind),
                      paste0("gene", 1:n.gene))

iboxplot(expr, chartOpts=list(xlab="Mice", ylab="Gene expression"))
```

---

**iboxplot_output**  
*Shiny bindings for R/qtlcharts widgets*

**Description**

Output and render functions for using R/qtlcharts widgets within Shiny applications and interactive Rmd documents.

**Usage**

```r
iboxplot_output(outputId, width = "100\%", height = "900")

iboxplot_render(expr, env = parent.frame(), quoted = FALSE)

idotplot_output(outputId, width = "100\%", height = "530")

idotplot_render(expr, env = parent.frame(), quoted = FALSE)

iheatmap_output(outputId, width = "100\%", height = "1000")

iheatmap_render(expr, env = parent.frame(), quoted = FALSE)

ipleiotropy_output(outputId, width = "100\%", height = "580")
```
Arguments

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>outputId</td>
<td>output variable to read from</td>
</tr>
<tr>
<td>width, height</td>
<td>Must be a valid CSS unit (like &quot;100%&quot;, &quot;400px&quot;, &quot;auto&quot;) or a number, which will be coerced to a string and have &quot;px&quot; appended.</td>
</tr>
</tbody>
</table>
**expr**  
An expression that generates a networkD3 graph

**env**  
The environment in which to evaluate 'expr'.

**quoted**  
Is ‘expr’ a quoted expression (with ‘quote()’)? This is useful if you want to save an expression in a variable.

---

**idotplot**  
*Interactive phenotype x genotype plot*

---

**Description**

Creates an interactive graph of phenotypes vs genotypes at a marker.

**Usage**

idotplot(x, y, indID = NULL, group = NULL, chartOpts = NULL, digits = 5)

**Arguments**

- **x**  
Vector of groups of individuals (e.g., a genotype)

- **y**  
Numeric vector (e.g., a phenotype)

- **indID**  
Optional vector of character strings, shown with tool tips

- **group**  
Optional vector of categories for coloring points

- **chartOpts**  
A list of options for configuring the chart. Each element must be named using the corresponding option.

- **digits**  
Round data to this number of significant digits before passing to the chart function. (Use NULL to not round.)

**Value**

An object of class 'htmlwidget' that will intelligently print itself into HTML in a variety of contexts including the R console, within R Markdown documents, and within Shiny output bindings.

**See Also**

[iplot()], [iplotPXG()]

**Examples**

```r
n <- 100
g <- sample(LETTERS[1:3], n, replace=TRUE)
y <- rnorm(n, match(g, LETTERS[1:3])*10, 5)

idotplot(g, y)
```
**iheatmap**

**Interactive heat map**

**Description**

Creates an interactive heatmap, with each cell linked to plots of horizontal and vertical slices.

**Usage**

```r
iheatmap(z, x = NULL, y = NULL, chartOpts = NULL, digits = 5)
```

**Arguments**

- `z`: Numeric matrix of dim `length(x)` x `length(y)`
- `x`: Vector of numeric values for the x-axis
- `y`: Vector of numeric values for the y-axis
- `chartOpts`: A list of options for configuring the chart (see the coffeescript code). Each element must be named using the corresponding option.
- `digits`: Round data to this number of significant digits before passing to the chart function. (Use NULL to not round.)

**Details**

By default, the z-axis limits are from `-max(abs(z))` to `max(abs(z))`, and negative cells are colored blue to white which positive cells are colored white to red.

**Value**

An object of class `htmlwidget` that will intelligently print itself into HTML in a variety of contexts including the R console, within R Markdown documents, and within Shiny output bindings.

**See Also**

- `iplotCorr()`

**Examples**

```r
n <- 101
x <- y <- seq(-2, 2, len=n)
z <- matrix(ncol=n, nrow=n)
for(i in seq(along=x))
  for(j in seq(along=y))
    z[i,j] <- x[i]*y[j]*exp(-x[i]^2 - y[j]^2)

iheatmap(z, x, y)
```
ipleiotropy

**Description**

Creates an interactive graph of a scatterplot of two phenotypes, plus optionally the LOD curves for the two traits along one chromosome, with a slider for selecting the locations of two QTL which are then indicated on the LOD curves and the corresponding genotypes used to color the points in the scatterplot.

**Usage**

```r
ipleiotropy(
  cross,
  scanoneOutput = NULL,
  pheno.col = 1:2,
  lodcolumn = 1:2,
  chr = NULL,
  interval = NULL,
  fillgenoArgs = NULL,
  chartOpts = NULL,
  digits = 5
)
```

**Arguments**

- `cross` (Optional) Object of class "cross", see `qtl::read.cross()`.
- `scanoneOutput` (Optional) object of class "scanone", as output from `qtl::scanone()`.
- `pheno.col` Vector indicating two phenotype column in cross object; either numeric or character strings (the latter being the phenotype column names).
- `lodcolumn` Vector of two numeric values indicating LOD score columns to plot.
- `chr` A single chromosome ID, as a character string.
- `interval` A numeric vector of length 2, defining an interval that indicates what portion of the chromosome should be included.
- `fillgenoArgs` List of named arguments to pass to `qtl::fill.geno()`, if needed.
- `chartOpts` A list of options for configuring the chart (see the coffeescript code). Each element must be named using the corresponding option.
- `digits` Round data to this number of significant digits before passing to the chart function. (Use NULL to not round.)

**Details**

`qtl::fill.geno()` is used to impute missing genotypes. In this case, arguments to `qtl::fill.geno()` are passed as a list, for example `fillgenoArgs=list(method="argmax", error.prob=0.002, map.function="c-f")`. 
Individual IDs (viewable when hovering over a point in the scatterplot of the two phenotypes) are taken from the input 'cross' object, using the `qtl::getid()` function in R/qtl.

**Value**

An object of class 'htmlwidget' that will intelligently print itself into HTML in a variety of contexts including the R console, within R Markdown documents, and within Shiny output bindings.

**See Also**

[iplotScanone()], [iplotMScanone()], [iplotPXG()]

**Examples**

```r
library(qtl)
data(fake.bc)
fake.bc <- calc.genoprob(fake.bc[5,], step=1) # select chr 5
out <- scanone(fake.bc, method="hk", pheno.col=1:2)
ipleiotropy(fake.bc, out)

# omit the LOD curves
ipleiotropy(fake.bc)
```

---

**iplot**  

*Interactive scatterplot*

**Description**

Creates an interactive scatterplot.

**Usage**

```r
iplot(x, y = NULL, group = NULL, indID = NULL, chartOpts = NULL, digits = 5)
```

**Arguments**

- **x**  
  Numeric vector of x values
- **y**  
  Numeric vector of y values
- **group**  
  Optional vector of categories for coloring the points
- **indID**  
  Optional vector of character strings, shown with tool tips
- **chartOpts**  
  A list of options for configuring the chart. Each element must be named using the corresponding option.
- **digits**  
  Round data to this number of significant digits before passing to the chart function. (Use NULL to not round.)
Value

An object of class 'htmlwidget' that will intelligently print itself into HTML in a variety of contexts including the R console, within R Markdown documents, and within Shiny output bindings.

See Also

[iplotCorr()], [iplotCurves()], [itriplot()], [idotplot()], [iplotPXG()]

Examples

```r
x <- rnorm(100)
grp <- sample(1:3, 100, replace=TRUE)
y <- x*grp + rnorm(100)

iplot(x, y, grp)
```

Description

Creates an interactive graph with an image of a correlation matrix linked to underlying scatterplots.

Usage

```r
iplotCorr(
  mat,
  group = NULL,
  rows = NULL,
  cols = NULL,
  reorder = FALSE,
  corr = NULL,
  scatterplots = TRUE,
  chartOpts = NULL,
  digits = 5
)
```

Arguments

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mat</td>
<td>Data matrix (individuals x variables)</td>
</tr>
<tr>
<td>group</td>
<td>Optional vector of groups of individuals (e.g., a genotype)</td>
</tr>
<tr>
<td>rows</td>
<td>Selected rows of the correlation matrix to include in the image. Ignored if ‘corr’ is provided.</td>
</tr>
<tr>
<td>cols</td>
<td>Selected columns of the correlation matrix to include in the image. Ignored if ‘corr’ is provided.</td>
</tr>
</tbody>
</table>
reorder  If TRUE, reorder the variables by clustering. Ignored if ‘corr’ is provided as a subset of the overall correlation matrix.

corr  Correlation matrix (optional).

scatterplots  If ‘FALSE’, don’t have the heat map be linked to scatterplots.

chartOpts  A list of options for configuring the chart (see the coffeescript code). Each element must be named using the corresponding option.

digits  Round data to this number of significant digits before passing to the chart function. (Use NULL to not round.)

Details
‘corr’ may be provided as a subset of the overall correlation matrix for the columns of ‘mat’. In this case, the ‘reorder’, ‘rows’ and ‘cols’ arguments are ignored. The row and column names of ‘corr’ must match the names of some subset of columns of ‘mat’.

Individual IDs are taken from ‘rownames(mat)’; they must match ‘names(group)’.

Value
An object of class ‘htmlwidget’ that will intelligently print itself into HTML in a variety of contexts including the R console, within R Markdown documents, and within Shiny output bindings.

See Also
[iheatmap()], [scat2scat()], [iplotCurves()]

Examples

data(geneExpr)

iplotCorr(geneExpr$expr, geneExpr$genotype, reorder=TRUE,
  chartOpts=list(cortitle="Correlation matrix",
                 scattitle="Scatterplot"))

# use Spearman's correlation
corr <- cor(geneExpr$expr, method="spearman", use="pairwise.complete.obs")
# order by hierarchical clustering
o <- hclust(as.dist(1-corr))$order

iplotCorr(geneExpr$expr[,o], geneExpr$genotype, corr=corr[o,o],
  chartOpts=list(cortitle="Spearman correlation",
                 scattitle="Scatterplot"))
iplotCurves

Plot of a bunch of curves, linked to points in scatterplots

Description

Creates an interactive graph with a panel having a number of curves (say, a phenotype measured over time) linked to one or two (or no) scatter plots (say, of the first vs middle and middle vs last times).

Usage

iplotCurves(
  curveMatrix,
  times = NULL,
  scatter1 = NULL,
  scatter2 = NULL,
  group = NULL,
  chartOpts = NULL,
  digits = 5
)

Arguments

curveMatrix  Matrix (dim n_ind x n_times) with outcomes

times        Vector (length n_times) with time points for the columns of curveMatrix

scatter1     Matrix (dim n_ind x 2) with data for the first scatterplot

scatter2     Matrix (dim n_ind x 2) with data for the second scatterplot

group        Optional vector of groups of individuals (e.g., a genotype)

chartOpts    A list of options for configuring the chart (see the coffeescript code). Each element must be named using the corresponding option.

digits       Round data to this number of significant digits before passing to the chart function. (Use NULL to not round.)

Value

An object of class ‘htmlwidget‘ that will intelligently print itself into HTML in a variety of contexts including the R console, within R Markdown documents, and within Shiny output bindings.

See Also

[iplotCorr()], [iplot()], [scat2scat()]

Examples

```r
# random growth curves, based on some data
times <- 1:16
n <- 100
start <- rnorm(n, 5.2, 0.8)
slope1to5 <- rnorm(n, 2.6, 0.5)
slope5to16 <- rnorm(n, 0.24 + 0.09 * slope1to5, 0.195)
y <- matrix(ncol=16, nrow=n)
y[,1] <- start
for(j in 2:5)
  y[,j] <- y[,j-1] + slope1to5
for(j in 6:16)
  y[,j] <- y[,j-1] + slope5to16
y <- y + rnorm(prod(dim(y)), 0, 0.35)

iplotCurves(y, times, y[,c(1,5)], y[,c(5,16)],
  chartOpts=list(curves_xlab="Time", curves_ylab="Size",
                 scat1_xlab="Size at T=1", scat1_ylab="Size at T=5",
                 scat2_xlab="Size at T=5", scat2_ylab="Size at T=16"))
```

iplotMap

Interactive genetic map plot

Description

Creates an interactive graph of a genetic marker map.

Usage

```r
iplotMap(
  map,
  chr = NULL,
  shift = FALSE,
  horizontal = FALSE,
  chartOpts = NULL,
  digits = 5
)
```

Arguments

- `map`: Object of class "map"; a list with each component being a vector of marker positions. You can also provide an object of class "cross", in which case the map is extracted with [qtl::pull.map()].
- `chr`: (Optional) Vector indicating the chromosomes to plot.
- `shift`: If TRUE, shift each chromosome so that the initial marker is at position 0.
Description

Creates an interactive graph of a set of single-QTL genome scans, as calculated by \([qtl::scanone()\). If ‘cross’ or ‘effects’ are provided, LOD curves will be linked to a panel with estimated QTL effects.

Usage

\[
\text{iplotMScanone}(
  \text{scanoneOutput},
  \text{cross} = \text{NULL},
  \text{lodcolumn} = \text{NULL},
  \text{pheno.col} = \text{NULL},
  \text{times} = \text{NULL},
  \text{effects} = \text{NULL},
  \text{chr} = \text{NULL},
  \text{chartOpts} = \text{NULL},
  \text{digits} = 5
\)
\]
Arguments

scanoneOutput Object of class "scanone", as output from \texttt{qtl::scanone()}.
cross (Optional) Object of class "cross", see \texttt{qtl::read.cross()}.
lodcolumn Numeric value indicating LOD score column to plot.
pheno.col (Optional) Phenotype column in cross object.
times (Optional) Vector (length equal to the number of LOD score columns) with quantitative values to which the different LOD score columns correspond (times of measurements, or something like age or dose). These need to be ordered and equally-spaced. If omitted, the names of the columns in `scanoneOutput` are used and treated as qualitative.
effects (Optional) Estimated QTL effects, as obtained with \texttt{estQTLeffects()}.
chr (Optional) Optional vector indicating the chromosomes for which LOD scores should be calculated. This should be a vector of character strings referring to chromosomes by name; numeric values are converted to strings. Refer to chromosomes with a preceding - to have all chromosomes but those considered. A logical \texttt{(TRUE/FALSE)} vector may also be used.
chartOpts A list of options for configuring the chart (see the coffeescript code). Each element must be named using the corresponding option.
digits Round data to this number of significant digits before passing to the chart function. (Use \texttt{NULL} to not round.)

Details

If `cross` is provided, Haley-Knott regression is used to estimate QTL effects at each pseudomarker.

Value

An object of class `htmlwidget` that will intelligently print itself into HTML in a variety of contexts including the R console, within R Markdown documents, and within Shiny output bindings.

See Also

\texttt{iplotScanone()}.

Examples

data(grav)
library(qtl)
grav <- calc.genoprob(grav, step=1)
grav <- reduce2grid(grav)

# we're going to subset the phenotypes
phecol <- seq(1, nphe(grav), by=5)

# the times were saved as an attributed
times <- attr(grav, "time")[phecol]
# genome scan
out <- scanone(grav, phe=phecol, method="hk")

# plot with qualitative labels on y-axis
iplotMScanone(out)

# plot with quantitative y-axis
iplotMScanone(out, times=times)

# estimate QTL effect for each time point at each genomic position
eff <- estQTLeffects(grav, phe=seq(1, nphe(grav), by=5), what="effects")

# plot with QTL effects included (and with quantitative y-axis)
iplotMScanone(out, effects=eff, times=times,
               chartOpts=list(eff_ylab="QTL effect", eff_xlab="Time (hrs)"))

---

**iplotPXG**  
*Interactive phenotype x genotype plot*

**Description**

Creates an interactive graph of phenotypes vs genotypes at a marker.

**Usage**

```r
iplotPXG(
  cross,
  marker,
  pheno.col = 1,
  chartOpts = NULL,
  fillgenoArgs = NULL,
  digits = 5
)
```

**Arguments**

- **cross**: Object of class "cross", see `qtl::read.cross()`.
- **marker**: Character string with marker name.
- **pheno.col**: Phenotype column in cross object.
- **chartOpts**: A list of options for configuring the chart. Each element must be named using the corresponding option.
- **fillgenoArgs**: List of named arguments to pass to `qtl::fill.geno()`, if needed.
- **digits**: Round data to this number of significant digits before passing to the chart function. (Use NULL to not round.)
iplotRF

Interactive plot of recombination fractions

Description

Creates an interactive graph of estimated recombination fractions and LOD scores for all pairs of markers.

Usage

iplotRF(cross, chr = NULL, chartOpts = NULL, digits = 5)
Arguments

- **cross**: Object of class "cross", see [qtl::read.cross()].
- **chr**: Optional vector indicating chromosomes to include. This should be a vector of character strings referring to chromosomes by name; numeric values are converted to strings. Refer to chromosomes with a preceding '-' to have all chromosomes but those considered. A logical (TRUE/FALSE) vector may also be used.
- **chartOpts**: A list of options for configuring the chart. Each element must be named using the corresponding option.
- **digits**: Round data to this number of significant digits before passing to the chart function. (Use NULL to not round.)

Details

The usual 'height' and 'width' options in 'chartOpts' are ignored in this plot. Instead, you may provide 'pixelPerCell' (number of pixels per cell in the heat map), 'chrGap' (gap in pixels between chromosomes in the heat map), 'cellHeight' (height in pixels of each cell in the cross-tabulation), 'cellWidth' (width in pixels of each cell in the cross-tabulation), and 'hbot' (height in pixels of the lower panels showing cross-sections of the heat map).

Value

An object of class 'htmlwidget' that will intelligently print itself into HTML in a variety of contexts including the R console, within R Markdown documents, and within Shiny output bindings.

See Also

[qtl::est.rf()], [qtl::plotRF()]

Examples

```r
library(qtl)
data(fake.f2)
fake.f2 <- est.rf(fake.f2)
iplotRF(fake.f2)
```

Description

`iptplotScanone` is an interactive LOD curve.

Creates an interactive graph of a single-QTL genome scan, as calculated by [qtl::scanone()]. If 'cross' is provided, the LOD curves are linked to a phenotype x genotype plot for a marker: Click on a marker on the LOD curve and see the corresponding phenotype x genotype plot.
iplotScanone

Usage

```r
iplotScanone(
  scanoneOutput,
  cross = NULL,
  lodcolumn = 1,
  pheno.col = 1,
  chr = NULL,
  pxgtype = c("ci", "raw"),
  fillgenoArgs = NULL,
  chartOpts = NULL,
  digits = 5
)
```

Arguments

- `scanoneOutput` Object of class "scanone", as output from `qtl::scanone()`.
- `cross` (Optional) Object of class "cross", see `qtl::read.cross()`.
- `lodcolumn` Numeric value indicating LOD score column to plot.
- `pheno.col` (Optional) Phenotype column in cross object.
- `chr` (Optional) Vector indicating the chromosomes for which LOD scores should be calculated. This should be a vector of character strings referring to chromosomes by name; numeric values are converted to strings. Refer to chromosomes with a preceding - to have all chromosomes but those considered. A logical (TRUE/FALSE) vector may also be used.
- `pxgtype` If phenotype x genotype plot is to be shown, should it be with means ± 2 SE ("ci"), or raw phenotypes ("raw")?
- `fillgenoArgs` List of named arguments to pass to `qtl::fill.geno()`, if needed.
- `chartOpts` A list of options for configuring the chart (see the coffeescript code). Each element must be named using the corresponding option.
- `digits` Round data to this number of significant digits before passing to the chart function. (Use NULL to not round.)

Details

If 'cross' is provided, `qtl::fill.geno()` is used to impute missing genotypes. In this case, arguments to `qtl::fill.geno()` are passed as a list, for example `fillgenoArgs=list(method="argmax", error.prob=0.002, map.function="c-f")`.

With 'pxgtype="raw"', individual IDs (viewable when hovering over a point in the phenotype-by-genotype plot) are taken from the input 'cross' object, using the `qtl::getid()` function in R/qtl.

Value

An object of class 'htmlwidget' that will intelligently print itself into HTML in a variety of contexts including the R console, within R Markdown documents, and within Shiny output bindings.
iplotScantwo

Interactive plot of 2d genome scan

Description

Creates an interactive plot of the results of \texttt{qtl::scantwo()}, for a two-dimensional, two-QTL genome scan.

Usage

\begin{verbatim}
 iplotScantwo(
   scantwoOutput,  # Output of \texttt{qtl::scantwo()}
   cross = NULL,  # (Optional) Object of class "cross", see \texttt{qtl::read.cross()}
   lodcolumn = 1,  # Numeric value indicating LOD score column to plot.
   pheno.col = 1,  # Pheno column
   chr = NULL,  # Contig
   chartOpts = NULL,  # Chart options
   digits = 5
)
\end{verbatim}

Arguments

- \texttt{scantwoOutput} Output of \texttt{qtl::scantwo()}
- \texttt{cross} (Optional) Object of class "cross", see \texttt{qtl::read.cross()}
- \texttt{lodcolumn} Numeric value indicating LOD score column to plot.

See Also

- \texttt{iplotMScanone()}, \texttt{iplotPXG()}, \texttt{iplotMap()}

Examples

\begin{verbatim}
library(qtl)
data(hyper)
hyper <- calc.genoprob(hyper, step=1)
out <- scantwo(hyper)

# iplotScanone with no effects
iplotScanone(out, chr=c(1, 4, 6, 7, 15))

# iplotScanone with CIs
iplotScanone(out, hyper, chr=c(1, 4, 6, 7, 15))

# iplotScanone with raw phe x gen
iplotScanone(out, hyper, chr=c(1, 4, 6, 7, 15), pxgtype='raw')
\end{verbatim}
pheno.col (Optional) Phenotype column in cross object.

chr (Optional) Optional vector indicating the chromosomes for which LOD scores should be calculated. This should be a vector of character strings referring to chromosomes by name; numeric values are converted to strings. Refer to chromosomes with a preceding - to have all chromosomes but those considered. A logical (TRUE/FALSE) vector may also be used.

chartOpts A list of options for configuring the chart. Each element must be named using the corresponding option.

digits Round data to this number of significant digits before passing to the chart function. (Use NULL to not round.)

Details

The estimated QTL effects, and the genotypes in the phenotype x genotype plot, in the right-hand panels, are derived following a single imputation to fill in missing data, and so are a bit crude.

Note that the usual 'height' and 'width' options in 'chartOpts' are ignored here. Instead, you may provide 'pixelPerCell' (number of pixels per cell in the heat map), 'chrGap' (gaps between chr in heat map), 'wright' (width in pixels of right panels), and 'hbot' (height in pixels of each of the lower panels)

Value

An object of class 'htmlwidget' that will intelligently print itself into HTML in a variety of contexts including the R console, within R Markdown documents, and within Shiny output bindings.

[iplotScanone()]

Examples

library(qtl)
data(fake.f2)

fake.f2 <- calc.genoprob(fake.f2, step=5)
out <- scantwo(fake.f2, method="hk", verbose=FALSE)

iplotScantwo(out, fake.f2)
Usage

```r
itriplot(p, indID = NULL, group = NULL, chartOpts = NULL, digits = 5)
```

Arguments

- `p` Matrix of trinomial probabilities (n x 3); each row should sum to 1.
- `indID` Optional vector of character strings, shown with tool tips
- `group` Optional vector of categories for coloring the points
- `chartOpts` A list of options for configuring the chart. Each element must be named using the corresponding option.
- `digits` Round data to this number of significant digits before passing to the chart function. (Use NULL to not round.)

Value

An object of class `htmlwidget` that will intelligently print itself into HTML in a variety of contexts including the R console, within R Markdown documents, and within Shiny output bindings.

See Also

- `iplot()`, `iplotPXG()`, `idotplot()`

Examples

```r
n <- 100
p <- matrix(runif(3*n), ncol=3)
p <- p / colSums(p)
g <- sample(1:3, n, replace=TRUE)

itriplot(p, group=g)
```

---

R/qtlcharts version

print the installed version of R/qtlcharts

Description

print the installed version of R/qtlcharts

Usage

```r
qtllchartsversion()
```

Value

Character string with version number
Examples

qtLchartsVersion()

scat2scat  
Scatterplot driving another scatterplot

Description

A pair of linked scatterplots, where each point the first scatterplot corresponds to a scatter of points
in the second scatterplot. The first scatterplot corresponds to a pair of summary measures for a
larger dataset.

Usage

scat2scat(scat1data, scat2data, group = NULL, chartOpts = NULL, digits = 5)

Arguments

scat1data  Matrix with two columns; rownames are used as identifiers. Can have an opc-
nional third column with categories for coloring points in the first scatterplot (to
be used if ‘group’ is not provided).

scat2data  List of matrices each with at least two columns, to be shown in the second
scatterplot. The components of the list correspond to the rows in ‘scat1dat’. An
option third column can contain categories. Row names identify individual
points.

group  Categories for coloring points in the first scatterplot; length should be the num-
ber of rows in ‘scat1data’.

chartOpts  A list of options for configuring the chart. Each element must be named using
the corresponding option.

digits  Round data to this number of significant digits before passing to the chart func-
tion. (Use NULL to not round.)

Value

An object of class ‘htmlwidget’ that will intelligently print itself into HTML in a variety of contexts
including the R console, within R Markdown documents, and within Shiny output bindings.

See Also

[iplotCorr()]
Examples

```r
# simulate some data
p <- 500
n <- 300
SD <- runif(p, 1, 5)
r <- runif(p, -1, 1)
scat2 <- vector("list", p)
for(i in 1:p)
  scat2[[i]] <- matrix(rnorm(2*n), ncol=2) %*% chol(SD[i]^2*matrix(c(1, r[i], r[i], 1), ncol=2))
scat1 <- cbind( SD=SD, r=r)
# plot it
scat2scat(scat1, scat2)
```

setScreenSize

Set default maximum screen size

Description

Set the default screen size as a global option.

Usage

```r
setScreenSize(size = c("normal", "small", "large"), height, width)
```

Arguments

- `size` Character vector representing screen size (normal, small, large). Ignored if height and width are provided.
- `height` (Optional) Height in pixels
- `width` (Optional) Width in pixels

Details

Used to set a global option, `qtlchartsScreenSize`, that contains the maximum height and maximum width for a chart in the browser.

"small", "normal", and "large" correspond to 600x900, 700x1000, and 1200x1600, for height x width, respectively.

Value

None.

Examples

```r
setScreenSize("large")
```
