Package ‘rsyslog’

June 4, 2021

Title Interface to the 'syslog' System Logger
Version 1.0.2
Maintainer Aaron Jacobs <atheriel@gmail.com>
Description Functions to write messages to the 'syslog' system logger API, available on all 'POSIX'-compatible operating systems. Features include tagging messages with a priority level and application type, as well as masking (hiding) messages below a given priority level.

open_syslog  Write Messages to the System Log

Description
Write messages to the system log via the POSIX syslog interface. Since this is a thin wrapper around that interface, you may also want to take a look at its documentation. Note that neither open_syslog() nor close_syslog() is actually required, but using them is good practice.

Usage
open_syslog(
    identifier,
    open_immediately = FALSE,
    include_pid = FALSE,
    fallback_to_console = FALSE,
    echo = FALSE,
    facility = NULL
)

syslog(message, level = "INFO", facility = NULL)

close_syslog()

Arguments
identifier  A string identifying the application.
open_immediately  When TRUE, the connection will be opened immediately (equivalent to using LOG_NDELAY). Otherwise it will be opened when the first message is written to the log (equivalent to using LOG_ODELAY).
include_pid  When TRUE, include the process ID in the log message. Equivalent to using LOG_PID.
fallback_to_console  Write to the system console (e.g. /dev/console) if there is an error while sending to the system logger. Equivalent to using LOG_CONS.
echo  Also log the message to standard error. Equivalent to using LOG_PERROR. Note that this is not actually part of the POSIX specification, and may not be available on your platform. If that is the case, setting this to TRUE will generate a warning.
facility  The type of program doing the logging, according to the guidelines in RFC 5424. Generally one of "USER" or "LOCAL0" through "LOCAL7". When this is NULL, fall back on the default.
message  The message to write to the system log.
level  The priority level of the message. One of "DEBUG", "INFO", "NOTICE", "WARNING", "ERR", "CRITICAL", "ALERT", or "EMERGE" – in that order of priority. See RFC 5424 for the basis of this schema.
set_syslog_mask

Examples

## Not run:
open_syslog("my_script")
syslog("Running script.", level = "INFO")
syslog("Possible issue.", level = "WARNING")
close_syslog()

# Opening the syslog is not strictly necessary. You can
# simply write a message and it will open the log with the
# process name (likely "R") as the default.

syslog("Hello from R!", level = "WARNING")
close_syslog()

## End(Not run)

---

set_syslog_mask | Set the System Log Priority Mask

Description

set_syslog_mask can be used to prevent messages below a priority level from being written to the system log.

Usage

set_syslog_mask(level)

Arguments

level | Mask (hide) messages below this priority level. One of "DEBUG", "INFO", "NOTICE", "WARNING", "ERR", "CRITICAL", or "ALERT" – in that order of priority. See RFC 5424 for the basis of this schema.

Examples

## Not run:
open_syslog("my_script")
syslog("This message is visible.", level = "INFO")
set_syslog_mask("WARNING")
syslog("No longer visible.", level = "INFO")
syslog("Still visible.", level = "WARNING")
close_syslog()

## End(Not run)
