

Package ‘sdcMicro’

May 16, 2019

Type Package

Title Statistical Disclosure Control Methods for Anonymization of Data and Risk Estimation

Version 5.4.0

Date 2019-05-14

Description Data from statistical agencies and other institutions are mostly confidential. This package can be used for the generation of anonymized (micro)data, i.e. for the creation of public- and scientific-use files. In addition, various risk estimation methods are included. Note that the package includes a graphical user interface that allows to use various methods of this package.

sdcMicro-package

Statistical Disclosure Control (SDC) for the generation of protected microdata for researchers and for public use.

Description

This package includes all methods of the popular software mu-Argus plus several new methods. In comparison with mu-Argus the advantages of this package are that the results are fully reproducible even with the included GUI, that the package can be used in batch-mode from other software, that the functions can be used in a very flexible way, that everybody could look at the source code and that there are no time-consuming meta-data management is necessary. However, the user should have a detailed knowledge about SDC when applying the methods on data.

Details

The package is programmed using S4-classes and it comes with a well-defined class structure.

The implemented graphical user interface (GUI) for microdata protection serves as an easy-to-handle tool for users who want to use the sdcMicro package for statistical disclosure control but are not used to the native R command line interface. In addition to that, interactions between objects which results from the anonymization process are provided within the GUI. This allows an automated recalculation and displaying information of the frequency counts, individual risk, information loss and data utility after each anonymization step. In addition to that, the code for every anonymization step carried out within the GUI is saved in a script which can then be easily modified and reloaded.

Package: sdcMicro
Type: Package
Version: 2.5.9
Date: 2009-07-22
License: GPL 2.0

Examples

```
## example from Capobianchi, Polettini and Lucarelli:
data(franmdat)
f <- freqCalc(franmdat, keyVars=c(2,4,5,6),w=8)
f
f$fk
f$Fk
## with missings:
x <- franmdat
x[3,5] <- NA
x[4,2] <- x[4,4] <- NA
x[5,6] <- NA
x[6,2] <- NA
f2 <- freqCalc(x, keyVars=c(2,4,5,6),w=8)
f2$Fk
## individual risk calculation:
indivf <- indivRisk(f)
indivf$rk
## Local Suppression
localS <- localSupp(f, keyVar=2, threshold=0.25)
f2 <- freqCalc(localS$freqCalc, keyVars=c(2,4,5,6), w=8)
indivf2 <- indivRisk(f2)
indivf2$rk

## select another keyVar and run localSupp once again,
## if you think the table is not fully protected
data(free1)
free1 <- as.data.frame(free1)
f <- freqCalc(free1, keyVars=1:3, w=30)
ind <- indivRisk(f)
## and now you can use the interactive plot for individual risk objects:
## plot(ind)

## example from Capobianchi, Polettini and Lucarelli:
data(franmdat)
l1 <- localSuppression(franmdat, keyVars=c(2,4,5,6), importance=c(1,3,2,4))
l1
```

```

l1$x
l2 <- localSuppression(franccdat, keyVars=c(2,4,5,6), k=2)
l3 <- localSuppression(franccdat, keyVars=c(2,4,5,6), k=4)

## Data from mu-Argus:
## Global recoding:
data(free1)
free1 <- as.data.frame(free1)
free1[, "AGE"] <- globalRecode(free1[, "AGE"], c(1,9,19,29,39,49,59,69,100), labels=1:8)

## Top coding:
topBotCoding(free1[, "DEBTS"], value=9000, replacement=9100, kind="top")

## Numerical Rank Swapping:
## do not use the mu-Argus test data set (free1)
# since the numerical variables are (probably) faked.
data(Tarragona)
Tarragona1 <- rankSwap(Tarragona, P=10)

## Microaggregation:
m1 <- microaggregation(Tarragona, method="onedims", aggr=3)
m2 <- microaggregation(Tarragona, method="pca", aggr=3)
# summary(m1)
## approx. 1 minute computation time
# valTable(Tarragona, method=c("simple", "onedims", "pca"))

data(microData)
microData <- as.data.frame(microData)
m1 <- microaggregation(microData, method="mdav")
x <- m1$x ### fix me
summary(m1)
plotMicro(m1, 1, which.plot=1) # too less observations...
data(free1)
free1 <- as.data.frame(free1)
plotMicro(microaggregation(free1[,31:34], method="onedims"), 1, which.plot=1)

## disclosure risk (interval) and data utility:
m1 <- microaggregation(Tarragona, method="onedims", aggr=3)
dRisk(obj=Tarragona, xm=m1$mx)
dRisk(obj=Tarragona, xm=m2$mx)
dUtility(obj=Tarragona, xm=m1$mx)
dUtility(obj=Tarragona, xm=m2$mx)

## S4 class code for Adding Noise methods will be included
#in the next version of sdcMicro.

## Fast generation of synthetic data with aprox.
#the same covariance matrix as the original one.

data(mtcars)

## End(Not run)

```

Description

specify variables that are linked to a key variable. This results in all suppressions of the key-variable being also applied on the corresponding 'ghost'-variables.

Usage

```
addGhostVars(obj, keyVar, ghostVars)
```

Arguments

obj	an object of class <code>sdcMicroObj-class</code>
keyVar	character-vector of length 1 referring to a categorical key variable within obj.
ghostVars	a character vector specifying variables that are linked to keyVar. Variables listed here must not be listed in either slots <code>@keyVars</code> , <code>@numVars</code> , <code>@pramVars</code> , <code>@weightVar</code> , <code>@hhId</code> or <code>@strataVar</code> in obj.

Value

a modified `sdcMicroObj-class` object.

Examples

```
data(testdata2)
sdc <- createSdcObj(testdata2,
  keyVars=c('urbrur','roof','walls','water','electcon','relat','sex'),
  numVars=c('expend','income','savings'), w='sampling_weight')
## we want to link the anonymization status of key variabe 'urbrur' to 'hhcivil'
sdc <- addGhostVars(sdc, keyVar="urbrur", ghostVars=c("hhcivil"))
## we want to link the anonymization status of key variabe 'roof' to 'represent'
sdc <- addGhostVars(sdc, keyVar="roof", ghostVars=c("represent"))
```

addNoise	<i>Adding noise to perturb data</i>
----------	-------------------------------------

Description

Various methods for adding noise to perturb continuous scaled variables.

Usage

```
addNoise(obj, variables = NULL, noise = 150, method = "additive",
  ...)
```

Arguments

obj	either a <code>data.frame</code> or a <code>sdcMicroObj-class</code> that should be perturbed
variables	vector with names of variables that should be perturbed
noise	amount of noise (in percentages)
method	choose between 'additive', 'correlated', 'correlated2', 'restr', 'ROMM', 'outdetect'
...	see possible arguments below

Details

If 'obj' is of class `sdcMicroObj-class`, all continuous key variables are selected per default. If 'obj' is of class "data.frame" or "matrix", the continuous variables have to be specified.

Method 'additive' adds noise completely at random to each variable depending on its size and standard deviation. 'correlated' and method 'correlated2' adds noise and preserves the covariances as described in R. Brand (2001) or in the reference given below. Method 'restr' takes the sample size into account when adding noise. Method 'ROMM' is an implementation of the algorithm ROMM (Random Orthogonalized Matrix Masking) (Fienberg, 2004). Method 'outdetect' adds noise only to outliers. The outliers are identified with univariate and robust multivariate procedures based on a robust mahalanobis distances calculated by the MCD estimator.

Value

If 'obj' was of class `sdcMicroObj-class` the corresponding slots are filled, like `manipNumVars`, `risk` and `utility`.

If 'obj' was of class "data.frame" or "matrix" an object of class "micro" with following entities is returned:

x	the original data
xm	the modified (perturbed) data
method	method used for perturbation
noise	amount of noise

Examples

```
data(Tarragona)
a1 <- addNoise(Tarragona)
a1

data(testdata)
testdata[, c('expend', 'income', 'savings')] <-
addNoise(testdata[, c('expend', 'income', 'savings')])$xm

## for objects of class sdcMicroObj:
data(testdata2)
sdc <- createSdcObj(testdata2,
  keyVars=c('urbrur', 'roof', 'walls', 'water', 'electcon', 'relat', 'sex'),
  numVars=c('expend', 'income', 'savings'), w='sampling_weight')
```

```
sdc <- addNoise(sdc)
```

```
argus_microaggregation
```

argus_microaggregation

Description

calls microaggregation code from mu-argus. In case only one variable should be microaggregated and useOptimal is TRUE, Hansen-Mukherjee polynomial exact method is applied. In any other case, the Mateo-Domingo method is used.

Usage

```
argus_microaggregation(df, k, useOptimal = FALSE)
```

Arguments

df	a data.frame with only numerical columns
k	required group size
useOptimal	(logical) should optimal microaggregation be applied (only possible in case of one variable)

Value

a list with two elements

- original: the originally provided input data
- microaggregated: the microaggregated data.frame

See Also

mu-Argus manual at <http://neon.vb.cbs.nl/casc/Software/MUmanual15.1.pdf>

Examples

```
mat <- matrix(sample(1:100, 50, replace=TRUE), nrow=10, ncol=5)
df <- as.data.frame(mat)
res <- argus_microaggregation(df, k=5, useOptimal=FALSE)
```

argus_rankswap	<i>argus_rankswap</i>
----------------	-----------------------

Description

argus_rankswap

Usage

```
argus_rankswap(df, perc)
```

Arguments

df a data.frame with only numerical columns
perc a number defining the swapping percentage

Value

a list with two elements

- original: the originally provided input data
- swapped: the data.frame containing the swapped values

See Also

mu-Argus manual at <http://neon.vb.cbs.nl/casc/Software/MUmanual15.1.pdf>

Examples

```
mat <- matrix(sample(1:100, 50, replace=TRUE), nrow=10, ncol=5)  
df <- as.data.frame(mat)  
res <- argus_rankswap(df, perc=10)
```

calcRisks	<i>Recompute Risk and Frequencies for a sdcMicroObj</i>
-----------	---

Description

Recomputation of Risk should be done after manual changing the content of an object of class [sdcMicroObj-class](#)

Usage

```
calcRisks(obj, ...)
```

Arguments

obj an object of class `sdcMicroObj-class`
... no arguments at the moment

Details

By applying this function, the disclosure risk is re-estimated and the corresponding slots of an object of class `sdcMicroObj-class` are updated. This function mostly used internally to automatically update the risk after an sdc method is applied.

[sdcMicroObj-class](#)

Examples

```
data(testdata2)
sdc <- createSdcObj(testdata2,
  keyVars=c('urbrur', 'roof', 'walls', 'water', 'electcon', 'relat', 'sex'),
  numVars=c('expend', 'income', 'savings'), w='sampling_weight')
sdc <- calcRisks(sdc)
```

casc1

Small Artificial Data set

Description

Small Toy Example Data set which was used by Sanz-Mateo et.al.

Format

The format is: int [1:13, 1:7] 10 12 17 21 9 12 12 14 13 15 ... - attr(*, "dimnames")=List of 2 ..\$:
chr [1:13] "1" "2" "3" "4"\$: chr [1:7] "1" "2" "3" "4" ...

Examples

```
data(casc1)
casc1
```

CASCrefermicrodata *Census data set*

Description

This test data set was obtained on July 27, 2000 using the public use Data Extraction System of the U.S. Bureau of the Census.

Format

A data frame sampled from year 1995 with 1080 observations on the following 13 variables.

AFNLWGT Final weight (2 implied decimal places)

AGI Adjusted gross income

EMCONTRB Employer contribution for hlth insurance

FEDTAX Federal income tax liability

PTOTVAL Total person income

STATETAX State income tax liability

TAXINC Taxable income amount

POTHVAL Total other persons income

INTVAL Amt of interest income

PEARNVAL Total person earnings

FICA Soc. sec. retirement payroll deduction

WSALVAL Amount: Total Wage and salary

ERNVAL Business or Farm net earnings

Source

Public use file from the CASC project. More information on this test data can be found in the paper listed below.

Brand, R. and Domingo-Ferrer, J. and Mateo-Sanz, J.M., Reference data sets to test and compare SDC methods for protection of numerical microdata. Unpublished. <http://neon.vb.cbs.nl/casc/CASCrefermicrodata.pdf>

Examples

```
data(CASCrefermicrodata)
str(CASCrefermicrodata)
```

createNewID	<i>Creates new randomized IDs</i>
-------------	-----------------------------------

Description

This is useful if the record IDs consist, for example, of a geo identifier and the household line number. This method can be used to create new, random IDs that cannot be reconstructed.

Usage

```
createNewID(obj, newID, withinVar)
```

Arguments

obj	an <code>sdcMicroObj-class</code> -object
newID	a character specifying the desired variable name of the new ID
withinVar	if not NULL a character vector specifying a variable (e.g an existing household ID) which will be used when calculating the new IDs. If specified, the same IDs will be assigned to the same values of the given variable.

Value

an `sdcMicroObj-class`-object with updated slot `origData`

dataGen	<i>Fast generation of synthetic data</i>
---------	--

Description

Fast generation of (primitive) synthetic multivariate normal data.

Usage

```
dataGen(obj, ...)
```

Arguments

obj	an <code>sdcMicroObj-class</code> -object or a <code>data.frame</code>
...	see possible arguments below <ul style="list-style-type: none"> • n: amount of observations for the generated data, defaults to 200 • use: howto compute covariances in case of missing values, see also argument use in <code>cov</code>. The default choice is 'everything', other possible choices are 'all.obs', 'complete.obs', 'na.or.complete' or 'pairwise.complete.obs'.

Details

Uses the cholesky decomposition to generate synthetic data with approx. the same means and covariances. For details see at the reference.

Value

the generated synthetic data.

Note

With this method only multivariate normal distributed data with approximately the same covariance as the original data can be generated without reflecting the distribution of real complex data, which are, in general, not follows a multivariate normal distribution.

```

dRisk	<i>overall disclosure risk</i>
-------	--------------------------------

Description

Distance-based disclosure risk estimation via standard deviation-based intervals around observations.

Usage

```
dRisk(obj, ...)
```

Arguments

obj	a data.frame or object of class <code>sdcMicroObj-class</code>
...	possible arguments are: <ul style="list-style-type: none">• xm: perturbed data• k: percentage of the standard deviation

Details

An interval (based on the standard deviation) is built around each value of the perturbed value. Then we look if the original values lay in these intervals or not. With parameter k one can enlarge or down scale the interval.

Value

The disclosure risk or/and the modified `sdcMicroObj-class`

## and already stored in sdc

```

dRiskRMD

RMD based disclosure risk

Description

Distance-based disclosure risk estimation via robust Mahalanobis Distances.

Usage

```
dRiskRMD(obj, ...)
```

Arguments

obj	an <code>sdcMicroObj-class</code> -object or a data.frame
...	see possible arguments below

- xm masked data
- kweight for adjusting the influence of the robust Mahalanobis distances, i.e. to increase or decrease each of the disclosure risk intervals.
- k2parameter for method RMDID2 to choose a small interval around each masked observation.

Details

This method is an extension of method SDID because it accounts for the “outlyingness” of each observations. This is a quite natural approach since outliers do have a higher risk of re-identification and therefore these outliers should have larger disclosure risk intervals as observations in the center of the data cloud.

The algorithm works as follows:

1. Robust Mahalanobis distances are estimated in order to get a robust multivariate distance for each observation.
2. Intervals are estimated for each observation around every data point of the original data points where the length of the interval is defined/weighted by the squared robust Mahalanobis distance and the parameter k . The higher the RMD of an observation the larger the interval.
3. Check if the corresponding masked values fall into the intervals around the original values or not. If the value of the corresponding observation is within such an interval the whole observation is considered unsafe. So, we get a whole vector indicating which observation is safe or not, and we are finished already when using method RMDID1).
4. For method RMDID1w: we return the weighted (via RMD) vector of disclosure risk.
5. For method RMDID2: whenever an observation is considered unsafe it is checked if m other observations from the masked data are very close (defined by a parameter k_2 for the length of the intervals as for SDID or RSDID) to such an unsafe observation from the masked data, using Euclidean distances. If more than m points are in such a small interval, we conclude that this observation is “safe”.

Value

The disclosure risk or the modified [sdcMicroObj-class](#)

risk1	percentage of sensitive observations according to method RMDID1.
risk2	standardized version of risk1
wrisk1	amount of sensitive observations according to RMDID1 weighted by their corresponding robust Mahalanobis distances.
wrisk2	RMDID2 measure
indexRisk1	index of observations with high risk according to risk1 measure
indexRisk2	index of observations with high risk according to wrisk2 measure

dUtility

data utility

Description

IL1s data utility.

Usage

```
dUtility(obj, ...)
```

Arguments

obj	original data or object of class sdcMicroObj-class
...	see arguments below
	<ul style="list-style-type: none"> • xm: perturbed data • method: method IL1, IL1s or eigen. More methods are implemented in <code>summary.micro()</code>

Details

The standardised distances of the perturbed data values to the original ones are measured. Measure IL1 measures the distances between the original values and the perturbed ones, scaled by the standard deviation. Method ‘eigen’ and ‘robeigen’ compares the eigenvalues and robust eigenvalues from the original data and the perturbed data.

Value

data utility or modified entry for data utility the [sdcMicroObj-class](#).

head(EIA)
```

extractManipData	<i>Remove certain variables from the data set inside a sdc object.</i>
------------------	--

Description

Extract the manipulated data from an object of class `sdcMicroObj-class`

Usage

```
extractManipData(obj, ignoreKeyVars = FALSE, ignorePramVars = FALSE,
  ignoreNumVars = FALSE, ignoreGhostVars = FALSE,
  ignoreStrataVar = FALSE, randomizeRecords = "no")
```

Arguments

<code>obj</code>	object of class <code>sdcMicroObj-class</code>
<code>ignoreKeyVars</code>	If manipulated KeyVariables should be returned or the unchanged original variables
<code>ignorePramVars</code>	if manipulated PramVariables should be returned or the unchanged original variables
<code>ignoreNumVars</code>	if manipulated NumericVariables should be returned or the unchanged original variables
<code>ignoreGhostVars</code>	if manipulated Ghost (linked) Variables should be returned or the unchanged original variables

ignoreStrataVar

if manipulated StrataVariables should be returned or the unchanged original variables

randomizeRecords

(logical) specifies, if the output records should be randomized. The following options are possible:

- 'no' default, no randomization takes place
- 'simple' records are just randomly swapped.
- 'byHH' if slot 'hhId' is not NULL, the clusters defined by this variable are randomized across the dataset. If slot 'hhId' is NULL, the records or the dataset are randomly changed.
- 'withinHH' if slot 'hhId' is not NULL, the clusters defined by this variable are randomized across the dataset and additionally, the order of records within the clusters are also randomly changed. If slot 'hhId' is NULL, the records or the dataset are randomly changed.

Value

a data.frame containing the anonymized data set

Author(s)

Alexander Kowarik, Bernhard Meindl

Examples

```
## for objects of class sdcMicro:
data(testdata2)
sdc <- createSdcObj(testdata,
  keyVars=c('urbrur', 'roof'),
  numVars=c('expend', 'income', 'savings'), w='sampling_weight')
sdc <- removeDirectID(sdc, var="age")
dataM <- extractManipData(sdc)
```

francdat

data from the casc project

Description

Small synthetic data from Capobianchi, Poletti, Lucarelli

Format

A data frame with 8 observations on the following 8 variables.

Num1 a numeric vector

Key1 Key variable 1. A numeric vector

Num2 a numeric vector
Key2 Key variable 2. A numeric vector
Key3 Key variable 3. A numeric vector
Key4 Key variable 4. A numeric vector
Num3 a numeric vector
w The weight vector. A numeric vector

Details

This data set is very similar to that one which are used by the authors of the paper given below. We need this data set only for demonstration effect, i.e. that the package provides the same results as their software.

Source

<http://neon.vb.cbs.nl/casc/Deliv/12d1.pdf>

Examples

```
data(francdat)
francdat
```

free1

Demo data set from mu-Argus

Description

The public use toy demo data set from the mu-Argus software for SDC.

Format

The format is: num [1:4000, 1:34] 36 36 36 36 36 36 36 36 36 36 ... - attr(*, "dimnames")=List of 2 ..\$: NULL ..\$: chr [1:34] "REGION" "SEX" "AGE" "MARSTAT" ...

Details

Please, see at the link given below. Please note, that the correlation structure of the data is not very realistic, especially concerning the continuous scaled variables which drawn independently from are a multivariate uniform distribution.

Source

Public use file from the CASC project.

Examples

```
data(free1)
head(free1)
```

freq

Freq

Description

Extract sample frequency counts (fk) or estimated population frequency counts (Fk)

Usage

```
freq(obj, type = "fk")
```

Arguments

obj	an <code>sdcMicroObj-class</code> -object
type	either 'fk' or 'FK'

Value

a vector containing sample frequencies or weighted frequencies

Author(s)

Bernhard Meindl

Examples

```
data(testdata)
sdc <- createSdcObj(testdata,
  keyVars=c('urbrur', 'roof', 'walls', 'relat', 'sex'),
  pramVars=c('water', 'electcon'),
  numVars=c('expend', 'income', 'savings'), w='sampling_weight')
head(freq(sdc, type="fk"))
head(freq(sdc, type="Fk"))
```

freqCalc	<i>Frequencies calculation for risk estimation</i>
----------	--

Description

Computation and estimation of the sample and population frequency counts.

Usage

```
freqCalc(x, keyVars, w = NULL, alpha = 1)
```

Arguments

x	data frame or matrix
keyVars	key variables
w	column index of the weight variable. Should be set to NULL if one deal with a population.
alpha	numeric value between 0 and 1 specifying how much keys that contain missing values (NAs) should contribute to the calculation of fk and Fk. For the default value of 1, nothing changes with respect to the implementation in prior versions. Each <i>wildcard-match</i> would be counted while for alpha=0 keys with missing values would be basically ignored.

Details

The function considers the case of missing values in the data. A missing value stands for any of the possible categories of the variable considered. It is possible to apply this function to large data sets with many (categorical) key variables, since the computation is done in C.

freqCalc() does not support *sdcmicro* S4 class objects.

Value

Object from class `freqCalc`.

freqCalc	data set
keyVars	variables used for frequency calculation
w	index of weight vector. NULL if you do not have a sample.
alpha	value of parameter alpha
fk	the frequency of equal observations in the key variables subset sample given for each observation.
Fk	estimated frequency in the population
n1	number of observations with fk=1
n2	number of observations with fk=2

data.frame(Fka=f3a$Fk, Fkb=f3b$Fk, Fkc=f3c$Fk)
```

generateStrata	<i>Generate one strata variable from multiple factors</i>
----------------	---

Description

For strata defined by multiple variables (e.g. sex,age,country) one combined variable is generated.

Usage

```
generateStrata(df, stratavars, name)
```

Arguments

df	a data.frame
stratavars	character vector with variable name
name	name of the newly generated variable

Value

The original data set with one new column.

Author(s)

Alexander Kowarik

Examples

```
x <- testdata
x <- generateStrata(x,c("sex", "urbrur"), "strataIDvar")
head(x)
```

get.sdcMicroObj	<i>get.sdcMicroObj</i>
-----------------	------------------------

Description

extract information from [sdcMicroObj-class](#)-objects depending on argument type

Usage

```
get.sdcMicroObj(object, type)
```

Arguments

object	a <code>sdcMicroObj-class</code> -object
type	a character vector of length 1 defining what to calculate/return/modify. Allowed types are all slotNames of obj.

Value

a slot of a `sdcMicroObj-class`-object depending on argument type

Examples

```
sdc <- createSdcObj(testdata2,
  keyVars=c('urbrur','roof','walls','water','electcon','relat','sex'),
  numVars=c('expend','income','savings'), w='sampling_weight')
sl <- slotNames(sdc)
res <- sapply(sl, function(x) get.sdcMicroObj(sdc, type=x))
str(res)
```

 globalRecode

Global Recoding

Description

Global recoding of variables

Usage

```
globalRecode(obj, ...)
```

Arguments

obj	a numeric vector, a data.frame or an object of class <code>sdcMicroObj-class</code>
...	see possible arguments below <ul style="list-style-type: none"> • column: which keyVar should be changed. Character vector of length 1 specifying the variable name that should be recoded (required if obj is a data.frame or an object of class <code>sdcMicroObj-class</code>). • breaks: either a numeric vector of cut points or number giving the number of intervals which x is to be cut into. • labels: labels for the levels of the resulting category. By default, labels are constructed using "(a,b]" interval notation. If labels = FALSE, simple integer codes are returned instead of a factor. • method: The following arguments are supported: <ul style="list-style-type: none"> – “equidistant:” for equal sized intervals – “logEqui:” for equal sized intervals for log-transformed data – “equalAmount:” for intervals with approximately the same amount of observations

Details

If a labels parameter is specified, its values are used to name the factor levels. If none is specified, the factor level labels are constructed.

Value

the modified `sdcMicroObj-class` or a factor, unless labels = FALSE which results in the mere integer level codes.

Note

globalRecode can not be applied to vectors stored as factors from `sdcMicro` \geq 4.7.0!

groupAndRename	Join levels of a variables in an object of class <code>sdcMicroObj-class</code> or factor or <code>data.frame</code>
----------------	--

Description

If the input is an object of class `sdcMicroObj-class`, the specified factor-variable is recoded into a factor with less levels and risk-measures are automatically recomputed.

Usage

```
groupAndRename(obj, var, before, after, addNA = FALSE)
```

Arguments

obj	object of class <code>sdcMicroObj-class</code>
var	name of the keyVariable to change
before	vector of levels before recoding
after	name of new level after recoding
addNA	logical, if TRUE missing values in the input variables are added to the level specified in argument after.

Details

If the input is of class `data.frame`, the result is a `data.frame` with a modified column specified by `var`.

If the input is of class `factor`, the result is a `factor` with different levels.

Value

the modified `sdcMicroObj-class`

Examples

```
## for objects of class sdcMicro:
data(testdata2)
testdata2$urbrur <- as.factor(testdata2$urbrur)
sdc <- createSdcObj(testdata2,
  keyVars=c('urbrur','roof','walls','water','electcon','relat','sex'),
  numVars=c('expend','income','savings'), w='sampling_weight')
sdc <- groupAndRename(sdc, var="urbrur", before=c("1","2"), after=c("1"))
```

importProblem	<i>importProblem</i>
---------------	----------------------

Description

reads an sdcProblem with code that has been exported within [sdcApp](#).

Usage

```
importProblem(path)
```

Arguments

path a file path

Value

an object of class sdcMicro_GUI_export or an object of class 'simple.error'

Author(s)

Bernhard Meindl

indivRisk	<i>Individual Risk computation</i>
-----------	------------------------------------

Description

Estimation of the risk for each observation. After the risk is computed one can use e.g. the function `localSuppr()` for the protection of values of high risk. Further details can be found at the link given below.

Usage

```
indivRisk(x, method = "approx", qual = 1, survey = TRUE)
```

Arguments

x	object from class freqCalc
method	approx (default) or exact
qual	final correction factor
survey	TRUE, if we have survey data and FALSE if we deal with a population.

Details

S4 class `sdcMicro` objects are only supported by function `measure_risk` that also estimates the individual risk with the same method.

Value

- rk: base individual risk
- method: method
- qual: final correction factor
- fk: frequency count
- knames: colnames of the key variables

Note

The base individual risk method was developed by Benedetti, Capobianchi and Franconi

```

kAnon_violations	kAnon_violations
------------------	------------------

Description

returns the number of observations violating k-anonymity.

Usage

```
kAnon_violations(object, weighted, k)

## S4 method for signature 'sdcMicroObj,logical,numeric'
kAnon_violations(object, weighted,
  k)
```

Arguments

object	a sdcMicroObj-class object
weighted	TRUE or FALSE defining if sampling weights should be taken into account
k	a positive number defining parameter k

Value

the number of records that are violating k-anonymity based on unweighted sample data only (in case parameter `weighted` is FALSE) or computing the number of observations that are estimated to violate k-anonymity in the population in case parameter `weighted` equals TRUE.

LLmodGlobalRisk *Global risk using log-linear models.*

Description

The sample frequencies are assumed to be independent and following a Poisson distribution. The parameters of the corresponding parameters are estimated by a log-linear model including the main effects and possible interactions.

Usage

```
LLmodGlobalRisk(obj, method = "IPF", inclProb = NULL, form = NULL,
  modOutput = FALSE)
```

Arguments

obj	<code>sdcMicroObj-class</code> -object or a <code>data.frame</code> containing the categorical key variables.
method	At this time, only iterative proportional fitting (“IPF”) can be used.
inclProb	Inclusion probabilities (experimental)
form	A formula specifying the model.
modOutput	If TRUE, additional output is given.

Details

This measure aims to (1) calculate the number of sample uniques that are population uniques with a probabilistic Poisson model and (2) to estimate the expected number of correct matches for sample uniques.

ad 1) this risk measure is defined over all sample uniques (SU) as

$$\tau_1 = \sum_{SU} P(F_k = 1 | f_k = 1) \quad ,$$

i.e. the expected number of sample uniques that are population uniques.

ad 2) this risk measure is defined over all sample uniques (SU) as

$$\tau_2 = \sum_{SU} P(F_k = 1 | f_k = 1) \quad , \text{CORRECT!}$$

Since population frequencies F_k are unknown, they has to be estimated.

The iterative proportional fitting method is used to fit the parameters of the Poisson distributed frequency counts related to the model specified to fit the frequency counts. The obtained parameters are used to estimate a global risk, defined in Skinner and Holmes (1998).

Value

Two global risk measures or the modified risk in the `sdcMicroObj-class` object.

Note

LLmodGlobalRisk is deprecated for [modRisk](#) and is only provided for compatibility with older versions of this package. It may be removed in future versions.

LocalRecProg

Local recoding via Edmond's maximum weighted matching algorithm

Description

To be used on both categorical and numeric input variables, although usage on categorical variables is the focus of the development of this software.

Usage

```
LocalRecProg(obj, ancestors = NULL, ancestor_setting = NULL,  
             k_level = 2, FindLowestK = TRUE, weight = NULL,  
             lowMemory = FALSE, missingValue = NA, ...)
```

Arguments

obj	a data.frame or a sdcMicroObj-class-object
ancestors	Names of ancestors of the cateorical variables
ancestor_setting	For each ancestor the corresponding categorical variable
k_level	Level for k-anonymity

FindLowestK	requests the program to look for the smallest k that results in complete matches of the data.
weight	A weight for each variable (Default=1)
lowMemory	Slower algorithm with less memory consumption
missingValue	The output value for a suppressed value.
...	see arguments below <ul style="list-style-type: none"> • categoricalNames of categorical variables • numericalNames of numerical variables

Details

Each record in the data represents a category of the original data, and hence all records in the input data should be unique by the N Input Variables. To achieve bigger category sizes (k-anonymity), one can form new categories based on the recoding result and repeatedly apply this algorithm.

Value

dataframe with original variables and the suppressed variables (suffix _lr). / the modified [sdcMicroObj-class](#)

Methods

```
list("signature(obj=\"sdcMicroObj\")")
```

localSupp

Local Suppression

Description

A simple method to perform local suppression.

Usage

```
localSupp(obj, threshold = 0.15, keyVar)
```

Arguments

obj	object of class <code>freqCalc</code> or <code>sdcMicroObj-class</code> .
threshold	threshold for individual risk
keyVar	Variable on which some values might be suppressed

Details

Values of high risk (above the threshold) of a certain variable (parameter `keyVar`) are suppressed.

Value

an updated object of class `freqCalc` or the `sdcMicroObj-class` object with manipulated data.

localSuppression

Local Suppression to obtain k-anonymity

Description

Algorithm to achieve k-anonymity by performing local suppression.

Usage

```
localSuppression(obj, k = 2, importance = NULL, combs = NULL, ...)
```

```
kAnon(obj, k = 2, importance = NULL, combs = NULL, ...)
```

Arguments

obj	a <code>sdcMicroObj-class</code> -object or a <code>data.frame</code>
k	threshold for k-anonymity
importance	numeric vector of numbers between 1 and n (n=length of vector keyVars). This vector represents the "importance" of variables that should be used for local suppression in order to obtain k-anonymity. key-variables with importance=1 will - if possible - not suppressed, key-variables with importance=n will be used whenever possible.
combs	numeric vector. if specified, the algorithm will provide k-anonymity for each combination of n key variables (with n being the value of the ith element of this parameter. For example, if <code>combs=c(4,3)</code> , the algorithm will provide k-anonymity to all combinations of 4 key variables and then k-anonymity to all combinations of 3 key variables. It is possible to apply different k to these subsets by specifying k as a vector. If k has only one element, the same value of k will be used for all subgroups.
...	see arguments below <ul style="list-style-type: none"> • <code>keyVars</code>: names (or indices) of categorical key variables (for <code>data.frame</code> method) • <code>strataVars</code>: name (or index) of variable which is used for stratification purposes, used in the <code>data.frame</code> method. This means that k-anonymity is provided within each category of the specified variable. • <code>alpha</code>: numeric value between 0 and 1 specifying how much keys that contain missing values (NAs) should contribute to the calculation of <code>fk</code> and <code>Fk</code>. For the default value of 1, nothing changes with respect to the implementation in prior versions. Each <i>wildcard-match</i> would be counted while for <code>alpha=0</code> keys with missing values would be basically ignored. Used in the <code>data.frame</code> method only because in the method for <code>sdcMicroObj-class</code>-objects, this value is extracted from slot <code>options</code>.

Details

The algorithm provides a k-anonymized data set by suppressing values in key variables. The algorithm tries to find an optimal solution to suppress as few values as possible and considers the specified importance vector. If not specified, the importance vector is constructed in a way such that key variables with a high number of characteristics are considered less important than key variables with a low number of characteristics.

The implementation provides k-anonymity per strata, if slot 'strataVar' has been set in `sdcMicroObj-class` or if parameter 'strataVar' is used when applying the `data.frame` method. For details, have a look at the examples provided.

Value

Manipulated data set with suppressions that has k-anonymity with respect to specified key-variables or the manipulated data stored in the `sdcMicroObj-class`.

Note

Deprecated methods 'localSupp2' and 'localSupp2Wrapper' are no longer available in `sdcMicro` > 4.5.0. `kAnon` is a more intuitive term for `localSuppression` because the aim is always to obtain k-anonymity for some parts of the data.

## End(Not run)

```

mafast

Fast and Simple Microaggregation

Description

Function to perform a fast and simple (primitive) method of microaggregation. (for large datasets)

Usage

```
mafast(obj, variables = NULL, by = NULL, aggr = 3, measure = mean)
```

Arguments

obj	either a sdcMicroObj-class -object or a <code>data.frame</code>
variables	variables to microaggregate. If obj is of class <code>sdcMicroObj</code> the numerical key variables are chosen per default.
by	grouping variable for microaggregation. If obj is of class <code>sdcMicroObj</code> the strata variables are chosen per default.
aggr	aggregation level (default=3)
measure	aggregation statistic, mean, median, trim, onestep (default = mean)

Value

If ‘obj’ was of class [sdcMicroObj-class](#) the corresponding slots are filled, like `manipNumVars`, `risk` and `utility`. If ‘obj’ was of class “`data.frame`” or “`matrix`” an object of the same class is returned.

measure_risk

Disclosure Risk for Categorical Variables

Description

The function measures the disclosure risk for weighted or unweighted data. It computes the individual risk (and household risk if reasonable) and the global risk. It also computes a risk threshold based on a global risk value.

Prints a 'measure_risk'-object

Prints a 'ldiversity'-object

Usage

```
measure_risk(obj, ...)
```

```
ldiversity(obj, ldiv_index = NULL, l_rekurs_c = 2, missing = -999,
  ...)
```

```
## S3 method for class 'measure_risk'
print(x, ...)

## S3 method for class 'ldiversity'
print(x, ...)
```

Arguments

obj	Object of class <code>sdcMicroObj-class</code>
...	see arguments below <ul style="list-style-type: none"> • data: Input data, a data.frame. • keyVars: names (or indices) of categorical key variables (for data-frame method) • w: name of variable containing sample weights • hid: name of the clustering variable, e.g. the household ID • max_global_risk: Maximal global risk for threshold computation • fast_hier: If TRUE a fast approximation is computed if household data are provided.
ldiv_index	indices (or names) of the variables used for l-diversity
l_rekurs_c	l-Diversity Constant
missing	a integer value to be used as missing value in the C++ routine
x	Output of <code>measure_risk()</code> or <code>ldiversity()</code>

Details

To be used when risk of disclosure for individuals within a family is considered to be statistical independent.

Internally, function `freqCalc()` and `indivRisk` are used for estimation.

Measuring individual risk: The individual risk approach based on so-called super-population models. In such models population frequency counts are modeled given a certain distribution. The estimation procedure of sample frequency counts given the population frequency counts is modeled by assuming a negative binomial distribution. This is used for the estimation of the individual risk. The extensive theory can be found in Skinner (1998), the approximation formulas for the individual risk used is described in Franconi and Poletini (2004).

Measuring hierarchical risk: If “hid” - the index of variable holding information on the hierarchical cluster structures (e.g., individuals that are clustered in households) - is provided, the hierarchical risk is additionally estimated. Note that the risk of re-identifying an individual within a household may also affect the probability of disclosure of other members in the same household. Thus, the household or cluster-structure of the data must be taken into account when estimating disclosure risks. It is commonly assumed that the risk of re-identification of a household is the risk that at least one member of the household can be disclosed. Thus this probability can be simply estimated from individual risks as 1 minus the probability that no member of the household can be identified.

Global risk: The sum of the individual risks in the dataset gives the expected number of re-identifications that serves as measure of the global risk.

L-Diversity: If “ldiv_index” is unequal to NULL, i.e. if the indices of sensible variables are specified, various measures for L-diversity are calculated. L-diversity is an extension of the well-known k-anonymity approach where also the uniqueness in sensible variables for each pattern spanned by the key variables are evaluated.

Value

A modified `sdcMicroObj-class` object or a list with the following elements:

- `global_risk_ER`: expected number of re-identification.
- `global_risk`: global risk (sum of individual risks).
- `global_risk_pct`: global risk in percent.
- `Res`: matrix with the risk, frequency in the sample and grossed-up frequency in the population (and the hierarchical risk) for each observation.
- `global_threshold`: for a given `max_global_risk` the threshold for the risk of observations.
- `max_global_risk`: the input `max_global_risk` of the function.
- `hier_risk_ER`: expected number of re-identification with household structure.
- `hier_risk`: global risk with household structure (sum of individual risks).
- `hier_risk_pct`: global risk with household structure in percent.
- `ldiversity`: Matrix with Distinct_Ldiversity, Entropy_Ldiversity and Recursive_Ldiversity for each sensitivity variable.

## sdc <- measure_risk(sdc)

```

mergeHouseholdData *Replaces the raw household-level data with the anonymized household-level data in the full dataset for anonymization of data with a household structure (or other hierarchical structure). Requires a matching household ID in both files.*

Description

Replaces the raw household-level data with the anonymized household-level data in the full dataset for anonymization of data with a household structure (or other hierarchical structure). Requires a matching household ID in both files.

Usage

```
mergeHouseholdData(dat, hhId, dathh)
```

Arguments

dat	a data.frame with the full dataset
hhId	name of the household (cluster) ID (identical in both datasets)
dathh	a dataframe with the treated household level data (generated for example with selectHouseholdData)

Value

a data.frame with the treated household level variables and the raw individual level variables

Author(s)

Thijs Benschop and Bernhard Meindl

Examples

```
## Load data
x <- testdata
## Create household level dataset
x_hh <- selectHouseholdData(dat=x, hhId="ori_hid",
  hhVars=c("urbrur", "roof", "walls", "water", "electcon", "household_weights"))
## Anonymize household level dataset and extract data
sdc_hh <- createSdcObj(x_hh, keyVars=c('urbrur', 'roof'), w='household_weights')
sdc_hh <- kAnon(sdc_hh, k = 3)
x_hh_anon <- extractManipData(sdc_hh)

## Merge anonymized household level data back into the full dataset
x_anonhh <- mergeHouseholdData(x, "ori_hid", x_hh_anon)

## Anonymize full dataset and extract data
sdc_full <- createSdcObj(x_anonhh, keyVars=c('sex', 'age', 'urbrur', 'roof'), w='sampling_weight')
sdc_full <- kAnon(sdc_full, k = 3)
x_full_anon <- extractManipData(sdc_full)
```

microaggregation	<i>Microaggregation</i>
------------------	-------------------------

Description

Function to perform various methods of microaggregation.

Usage

```
microaggregation(obj, variables = NULL, aggr = 3,
  strata_variables = NULL, method = "mdav", weights = NULL, nc = 8,
  clustermethod = "clara", measure = "mean", trim = 0, varsort = 1,
  transf = "log")
```

Arguments

<code>obj</code>	either an object of class <code>sdcMicroObj-class</code> or a <code>data.frame</code>
<code>variables</code>	variables to microaggregate. For <code>NULL</code> : If <code>obj</code> is of class <code>sdcMicroObj</code> , all numerical key variables are chosen per default. For <code>data.frames</code> , all columns are chosen per default.
<code>aggr</code>	aggregation level (default=3)
<code>strata_variables</code>	for <code>data.frames</code> , by-variables for applying microaggregation only within strata defined by the variables. For <code>sdcMicroObj-class</code> -objects, the stratification-variable defined in slot <code>@strataVar</code> is used. This slot can be changed any time using <code>strataVar<-</code> .
<code>method</code>	<code>pca</code> , <code>rmd</code> , <code>onedims</code> , <code>single</code> , <code>simple</code> , <code>clustpca</code> , <code>pppca</code> , <code>clustpppca</code> , <code>mdav</code> , <code>clustmcdpca</code> , <code>influence</code> , <code>mcdpca</code>
<code>weights</code>	sampling weights. If <code>obj</code> is of class <code>sdcMicroObj</code> the vector of sampling weights is chosen automatically. If determined, a weighted version of the aggregation measure is chosen automatically, e.g. weighted median or weighted mean.
<code>nc</code>	number of cluster, if the chosen method performs cluster analysis
<code>clustermethod</code>	<code>clustermethod</code> , if necessary
<code>measure</code>	aggregation statistic, <code>mean</code> , <code>median</code> , <code>trim</code> , <code>onestep</code> (default= <code>mean</code>)
<code>trim</code>	trimming percentage, if <code>measure=trim</code>
<code>varsort</code>	variable for sorting, if <code>method=single</code>
<code>transf</code>	transformation for data <code>x</code>

Details

On <http://neon.vb.cbs.nl/casc/Glossary.htm> one can found the “official” definition of microaggregation:

Records are grouped based on a proximity measure of variables of interest, and the same small groups of records are used in calculating aggregates for those variables. The aggregates are released instead of the individual record values.

The recommended method is “rmd” which forms the proximity using multivariate distances based on robust methods. It is an extension of the well-known method “mdav”. However, when computational speed is important, method “mdav” is the preferable choice.

While for the proximity measure very different concepts can be used, the aggregation itself is naturally done with the arithmetic mean. Nevertheless, other measures of location can be used for aggregation, especially when the group size for aggregation has been taken higher than 3. Since the median seems to be unsuitable for microaggregation because of being highly robust, other measures which are included can be chosen. If a complex sample survey is microaggregated, the corresponding sampling weights should be determined to either aggregate the values by the weighted arithmetic mean or the weighted median.

This function contains also a method with which the data can be clustered with a variety of different clustering algorithms. Clustering observations before applying microaggregation might be useful. Note, that the data are automatically standardised before clustering.

The usage of clustering method ‘Mclust’ requires package `mclust02`, which must be loaded first. The package is not loaded automatically, since the package is not under GPL but comes with a different licence.

There are also some projection methods for microaggregation included. The robust version ‘pppca’ or ‘clustpppca’ (clustering at first) are fast implementations and provide almost everytime the best results.

Univariate statistics are preserved best with the individual ranking method (we called them ‘oned-ims’, however, often this method is named ‘individual ranking’), but multivariate statistics are strongly affected.

With method ‘simple’ one can apply microaggregation directly on the (unsorted) data. It is useful for the comparison with other methods as a benchmark, i.e. replies the question how much better is a sorting of the data before aggregation.

Value

If ‘obj’ was of class `sdcMicroObj-class` the corresponding slots are filled, like `manipNumVars`, `risk` and `utility`. If ‘obj’ was of class “data.frame”, an object of class “micro” with following entities is returned:

- `x`: original data
- `mx`: the microaggregated dataset
- `method`: method
- `aggr`: aggregation level
- `measure`: proximity measure for aggregation

Note

if only one variable is specified, `mafast` is applied and argument `method` is ignored. Parameters `measure` are ignored for methods `mdav` and `rmd`.

Author(s)

Matthias Templ, Bernhard Meindl

For method “mdav”: This work is being supported by the International Household Survey Network (IHSN) and funded by a DGF Grant provided by the World Bank to the PARIS21 Secretariat at the Organisation for Economic Co-operation and Development (OECD). This work builds on previous work which is elsewhere acknowledged.

Author for the integration of the code for mdav in R: Alexander Kowarik.

microaggrGower	<i>Microaggregation for numerical and categorical key variables based on a distance similar to the Gower Distance</i>
----------------	---

Description

The microaggregation is based on the distances computed similar to the Gower distance. The distance function makes distinction between the variable types factor, ordered, numerical and mixed (semi-continuous variables with a fixed probability mass at a constant value e.g. 0)

Usage

```
microaggrGower(obj, variables = NULL, aggr = 3, dist_var = NULL,
  by = NULL, mixed = NULL, mixed.constant = NULL, trace = FALSE,
  weights = NULL, numFun = mean, catFun = VIM::sampleCat,
  addRandom = FALSE)
```

Arguments

obj	sdcMicroObj-class-object or a data.frame
variables	character vector with names of variables to be aggregated (Default for sdcMicroObj is all keyVariables and all numeric key variables)
aggr	aggregation level (default=3)
dist_var	character vector with variable names for distance computation
by	character vector with variable names to split the dataset before performing microaggregation (Default for sdcMicroObj is strataVar)
mixed	character vector with names of mixed variables
mixed.constant	numeric vector with length equal to mixed, where the mixed variables have the probability mass
trace	TRUE/FALSE for some console output
weights	numerical vector with length equal the number of variables for distance computation
numFun	function: to be used to aggregated numerical variables
catFun	function: to be used to aggregated categorical variables
addRandom	TRUE/FALS if a random value should be added for the distance computation.

Details

The function sampleCat samples with probabilities corresponding to the occurrence of the level in the NNs. The function maxCat chooses the level with the most occurrences and random if the maximum is not unique.

Value

The function returns the updated `sdcMicroObj` or simply an altered data frame.

Note

In each by group all distance are computed, therefore introducing more by-groups significantly decreases the computation time and memory consumption.

```

microData

microData

Description

Small artificial toy data set.

Format

The format is: num [1:13, 1:5] 5 7 2 1 7 8 12 3 15 4 ... - attr(*, "dimnames")=List of 2 ..\$: chr [1:13] "10000" "11000" "12000" "12100"\$: chr [1:5] "one" "two" "three" "four" ...

Examples

```
data(microData)
microData <- as.data.frame(microData)
m1 <- microaggregation(microData, method="mdav")
summary(m1)
```

 modRisk

Global risk using log-linear models.

Description

The sample frequencies are assumed to be independent and following a Poisson distribution. The parameters of the corresponding parameters are estimated by a log-linear model including the main effects and possible interactions.

Usage

```
modRisk(obj, method = "default", weights, formulaM, bound = Inf, ...)
```

Arguments

obj	An <code>sdcMicroObj</code> -class-object or a numeric matrix or data.frame containing all variables required in the specified model.
method	chose method for model-based risk-estimation. Currently, the following methods can be selected: <ul style="list-style-type: none"> • "default": the standard log-linear model. • "CE": the Clogg Eliason method, additionally, considers survey weights by using an offset term. • "PML": the pseudo maximum likelihood method. • "weightedLLM": the weighted maximum likelihood method, considers survey weights by including them as one of the predictors. • "IPF": iterative proportional fitting as used in deprecated method 'LLmod-GlobalRisk'.
weights	a variable name specifying sampling weights
formulaM	A formula specifying the model.
bound	a number specifying a threshold for 'risky' observations in the sample.
...	additional parameters passed through, currently ignored.

Details

This measure aims to (1) calculate the number of sample uniques that are population uniques with a probabilistic Poisson model and (2) to estimate the expected number of correct matches for sample uniques.

ad 1) this risk measure is defined over all sample uniques as

$$\tau_1 = \sum_{j:f_j=1} P(F_j = 1|f_j = 1) \quad ,$$

i.e. the expected number of sample uniques that are population uniques.

ad 2) this risk measure is defined over all sample uniques as

$$\tau_2 = \sum_{j:f_j=1} P(1/F_j|f_j = 1) \quad .$$

Since population frequencies F_k are unknown, they need to be estimated.

The iterative proportional fitting method is used to fit the parameters of the Poisson distributed frequency counts related to the model specified to fit the frequency counts. The obtained parameters are used to estimate a global risk, defined in Skinner and Holmes (1998).

Value

Two global risk measures and some model output given the specified model. If this method is applied to an `sdcMicroObj-class`-object, the slot 'risk' in the object ist updated with the result of the model-based risk-calculation.

mvTopCoding

*Detection and winsorization of multivariate outliers***Description**

Imputation and detection of outliers

Usage

```
mvTopCoding(x, maha=NULL, center=NULL, cov=NULL, alpha=0.025)
```

Arguments

x	object of class matrix with numeric entries
maha	squared mahalanobis distance of each observation
center	center of data, needed for calculation of mahalanobis distance (if not provide)
cov	covariance matrix of data, needed for calculation of mahalanobis distance (if not provide)
alpha	significance level, determining the ellipsoide to which outliers should be placed upon

Details

Winsorizes the potential outliers on the ellipsoid defined by (robust) Mahalanobis distances in direction to the center of the data

Value

the imputed winsorized data

nextSdcObj

nextSdcObj

Description

internal function used to provide the undo-functionality.

Usage

```
nextSdcObj(obj)
```

Arguments

obj a `sdcMicroObj-class` object

Value

a modified `sdcMicroObj-class` object

`plot.localSuppression` *plot method for localSuppression objects*

Description

Barplot for objects from class `localSuppression`.

Usage

```
## S3 method for class 'localSuppression'  
plot(x, ...)
```

Arguments

x object of class 'localSuppression'
... Additional arguments, currently available are:

- `showDetails` logical, if set, a plot of suppressions by strata is shown (if possible)

Details

Just look at the resulting plot.

print(ls)
plot(ls)
plot(ls, showDetails=TRUE)
```

plot.sdcMicroObj *Plotfunctions for objects of class `sdcMicroObj-class`*

Description

Descriptive plot function for `sdcMicroObj-class`-objects. Currently only visualization of local suppression is implemented.

Usage

```
## S3 method for class 'sdcMicroObj'
plot(x, type = "ls", ...)
```

Arguments

x	An object of class <code>sdcMicroObj-class</code>
type	specified what kind of plot will be generated <ul style="list-style-type: none">• 'ls': plot of local suppressions in key variables
...	currently ignored

Author(s)

Bernhard Meindl

Examples

```
data(testdata)
## Not run:
# dontrun because Examples with CPU time > 2.5 times elapsed time
sdc <- createSdcObj(testdata,
  keyVars=c('urbrur','roof','walls','relat','sex'),
  pramVars=c('water','electcon'),
  numVars=c('expend','income','savings'), w='sampling_weight')
sdc <- kAnon(sdc, k=5)
plot(sdc, type="ls")

## End(Not run)
```

`plotMicro`*Comparison plots*

Description

Plots for the comparison of the original data and perturbed data.

Usage

```
plotMicro(x, p, which.plot = 1:3)
```

Arguments

<code>x</code>	object from class <code>micro</code>
<code>p</code>	necessary parameter for the box cox transformation (<code>lambda</code>)
<code>which.plot</code>	which plot should be created? <ul style="list-style-type: none">• 1: density traces• 2: parallel boxplots• 3: differences in totals

Details

Univariate and multivariate comparison plots are implemented to detect differences between the perturbed and the original data, but also to compare perturbed data which are produced by different methods.

[microaggregation](#)

Examples

```
data(free1)
free1 <- as.data.frame(free1)
m1 <- microaggregation(free1[, 31:34], method="onedims", aggr=3)
m2 <- microaggregation(free1[, 31:34], method="pca", aggr=3)
plotMicro(m1, p=1, which.plot=1)
```

Description

To be used on categorical data stored as factors. The algorithm randomly changes the values of variables in selected records (usually the risky ones) according to an invariant probability transition matrix or a custom-defined transition matrix.

Usage

```
pram(obj, variables = NULL, strata_variables = NULL, pd = 0.8,
      alpha = 0.5)
```

Arguments

obj	Input data. Allowed input data are objects of class <code>data.frame</code> , <code>factor</code> or <code>sdcMicroObj-class</code> .
variables	Names of variables in 'obj' on which post-randomization should be applied. If obj is a factor, this argument is ignored. Please note that pram can only be applied to factor-variables.
strata_variables	Names of variables for stratification (will be set automatically for an object of class <code>sdcMicroObj-class</code> . One can also specify an integer vector or factor that specifies that desired groups. This vector must match the dimension of the input data set, however. For a possible use case, have a look at the examples.
pd	<p>minimum diagonal entries for the generated transition matrix P. Either a vector of length 1 (which is recycled) or a vector of the same length as the number of variables that should be postrandomized. It is also possible to set pd to a numeric matrix. This matrix will be used directly as the transition matrix. The matrix must be constructed as follows:</p> <ul style="list-style-type: none"> • the matrix must be a square matrix • the rownames and colnames of the matrix must match the levels (in the same order) of the factor-variable that should be postrandomized. • the rowSums and colSums of the matrix need to equal 1 <p>It is also possible to combine the different ways. For details have a look at the examples.</p>
alpha	amount of perturbation for the invariant Pram method. This is a numeric vector of length 1 (that will be recycled if necessary) or a vector of the same length as the number of variables. If one specified as transition matrix directly, alpha is ignored.
...	further input, currently ignored.

Value

a modified `sdcMicroObj-class` object or a new object containing original and post-randomized variables (with suffix "_pram").

Note

Deprecated method 'pram_strata' is no longer available in `sdcMicro > 4.5.0`

mat <- diag(length(levels(testdata2$roof)))

```

```
rownames(mat) <- colnames(mat) <- levels(testdata2$roof)
mat[1,] <- c(0.9,0,0,0.05,0.05)
sdc <- pram(sdc, variables="roof", pd=mat)
print(sdc, type="pram")
# we can also have a look at the transitions
get.sdcMicroObj(sdc, "pram")$transitions
```

print.freqCalc *Print method for objects from class freqCalc.*

Description

Print method for objects from class freqCalc.

Usage

```
## S3 method for class 'freqCalc'
print(x, ...)
```

Arguments

x object from class [freqCalc](#)
... Additional arguments passed through.

Value

information about the frequency counts for key variables for object of class [freqCalc](#).

Author(s)

Matthias Templ

See Also

[freqCalc](#)

Examples

```
## example from Capobianchi, Poletti and Lucarelli:
data(franmdat)
f <- freqCalc(franmdat, keyVars=c(2,4,5,6),w=8)
f
```

print.indivRisk	<i>Print method for objects from class indivRisk</i>
-----------------	--

Description

Print method for objects from class indivRisk

Usage

```
## S3 method for class 'indivRisk'  
print(x, ...)
```

Arguments

x	object from class indivRisk
...	Additional arguments passed through.

Value

few information about the method and the final correction factor for objects of class 'indivRisk'.

Author(s)

Matthias Templ

See Also

[indivRisk](#)

Examples

```
## example from Capobianchi, Polettini and Lucarelli:  
data(franmdat)  
f1 <- freqCalc(franmdat, keyVars=c(2,4,5,6),w=8)  
data.frame(fk=f1$fk, Fk=f1$Fk)  
## individual risk calculation:  
indivRisk(f1)
```

```
print.localSuppression
```

Print method for objects from class localSuppression

Description

Print method for objects from class localSuppression

Usage

```
## S3 method for class 'localSuppression'  
print(x, ...)
```

Arguments

x	object from class localSuppression
...	Additional arguments passed through.

Value

Information about the frequency counts for key variables for object of class 'localSuppression'.

Author(s)

Matthias Templ

See Also

[localSuppression](#)

Examples

```
## example from Capobianchi, Polettini and Lucarelli:  
data(franccdat)  
l1 <- localSuppression(franccdat, keyVars=c(2,4,5,6))  
l1
```

print.micro	<i>Print method for objects from class micro</i>
-------------	--

Description

printing an object of class micro

Usage

```
## S3 method for class 'micro'  
print(x, ...)
```

Arguments

x	object from class micro
...	Additional arguments passed through.

Value

information about method and aggregation level from objects of class micro.

Author(s)

Matthias Templ

See Also

[microaggregation](#)

Examples

```
data(free1)  
free1 <- as.data.frame(free1)  
m1 <- microaggregation(free1[, 31:34], method='onedims', aggr=3)  
m1
```

print.modrisk *Print method for objects from class modrisk*

Description

Print method for objects from class modrisk

Usage

```
## S3 method for class 'modrisk'  
print(x, ...)
```

Arguments

x an object of class [modrisk](#)
... Additional arguments passed through.

Value

Output of model-based risk estimation

Author(s)

Bernhard Meindl

See Also

[modRisk](#)

print.pram *Print method for objects from class pram*

Description

Print method for objects from class pram

Usage

```
## S3 method for class 'pram'  
print(x, ...)
```

Arguments

x an object of class [pram](#)
... Additional arguments passed through.

Value

absolute and relative frequencies of changed observations in each modified variable

Author(s)

Bernhard Meindl, Matthias Templ

Matthias Templ and Bernhard Meindl

[pram](#)

print.sdcMicroObj *Print and Extractor Functions for objects of class*
[sdcMicroObj-class](#)

Description

Descriptive print function for Frequencies, local Suppression, Recoding, categorical risk and numerical risk.

Usage

```
## S4 method for signature 'sdcMicroObj'
print(x, type = "kAnon", docat = TRUE, ...)
```

Arguments

x	An object of class sdcMicroObj-class
type	Selection of the content to be returned or printed
docat	logical, if TRUE (default) the results will be actually printed
...	the type argument for the print method, currently supported are: <ul style="list-style-type: none"> • general: basic information on the input obj such as the number of observations and variables. • kAnon: displays information about 2- and 3-anonymity • ls: displays various information if local suppression has been applied. • pram: displays various information if post-randomization has been applied. • recode: shows information about categorical key variables before and after recoding • risk: displays information on re-identification risks • numrisk: displays risk- and utility measures for numerical key variables

Details

Possible values for the type argument of the print function are: "freq": for Frequencies, "ls": for Local Supression output, "pram": for results of post-randomization "recode":for Recodes, "risk": forCategorical risk and "numrisk": for Numerical risk.

Possible values for the type argument of the freq function are: "fk": Sample frequencies and "Fk": weighted frequencies.

Author(s)

Alexander Kowarik, Matthias Templ, Bernhard Meindl

Examples

```
data(testdata)
sdc <- createSdcObj(testdata,
  keyVars=c('urbrur','roof','walls','relat','sex'),
  pramVars=c('water','electcon'),
  numVars=c('expend','income','savings'), w='sampling_weight')
sdc <- microaggregation(sdc, method="mdav", aggr=3)
print(sdc)
print(sdc, type="general")
print(sdc, type="ls")
print(sdc, type="recode")
print(sdc, type="risk")
print(sdc, type="numrisk")
print(sdc, type="pram")
print(sdc, type="kAnon")
print(sdc, type="comp_numvars")
```

print.suda2

Print method for objects from class suda2

Description

Print method for objects from class suda2.

Usage

```
## S3 method for class 'suda2'
print(x, ...)
```

Arguments

x an object of class suda2
 ... additional arguments passed through.

Value

Table of dis suda scores.

Author(s)

Matthias Templ

See Also[suda2](#)**Examples**

```
## Not run:
data(testdata)
data_suda2 <- suda2(testdata,variables=c("urbrur","roof","walls","water","sex"))
data_suda2

## End(Not run)
```

rankSwap

*Rank Swapping***Description**

Swapping values within a range so that, first, the correlation structure of original variables are preserved, and second, the values in each record are disturbed. To be used on numeric or ordinal variables where the rank can be determined and the correlation coefficient makes sense.

Usage

```
rankSwap(obj, variables = NULL, TopPercent = 5, BottomPercent = 5,
         K0 = -1, R0 = 0.95, P = 0, missing = NA, seed = NULL)
```

Arguments

obj	a sdcMicroObj-class -object or a <code>data.frame</code>
variables	names or index of variables for that rank swapping is applied. For an object of class sdcMicroObj-class , all numeric key variables are selected if <code>variables=NULL</code> .
TopPercent	Percentage of largest values that are grouped together before rank swapping is applied.
BottomPercent	Percentage of lowest values that are grouped together before rank swapping is applied.
K0	Subset-mean preservation factor. Preserves the means before and after rank swapping within a range based on K0. K0 is the subset-mean preservation factor such that $ X_1 - X_2 \leq \frac{2K_0 X_1}{\sqrt{(N_S)}}$, where X_1 and X_2 are the subset means of the field before and after swapping, and N_S is the sample size of the subset.

R0	Multivariate preservation factor. Preserves the correlation between variables within a certain range based on the given constant R0. We can specify the preservation factor as $R_0 = \frac{R_1}{R_2}$ where R_1 is the correlation coefficient of the two fields after swapping, and R_2 is the correlation coefficient of the two fields before swapping.
P	Rank range as percentage of total sample size. We can specify the rank range itself directly, noted as P , which is the percentage of the records. So two records are eligible for swapping if their ranks, i and j respectively, satisfy $ i-j \leq \frac{PN}{100}$, where N is the total sample size.
missing	missing - the value to be used as missing value in the C++ routine instead of NA. If NA, a suitable value is calculated internally. Note that in the returned dataset, all NA-values (if any) will be replaced with this value.
seed	Seed.

Details

Rank swapping sorts the values of one numeric variable by their numerical values (ranking). The restricted range is determined by the rank of two swapped values, which cannot differ, by definition, by more than P percent of the total number of observations. R0 and K0 are only used if positive. Only one of the two are used (R0 is preferred if both are positive).

Value

The rank-swapped data set or a modified `sdcMicroObj-class` object.

Author(s)

Alexander Kowarik for the interface, Bernhard Meindl for improvements.

For the underlying C++ code: This work is being supported by the International Household Survey Network (IHSN) and funded by a DGF Grant provided by the World Bank to the PARIS21 Secretariat at the Organisation for Economic Co-operation and Development (OECD). This work builds on previous work which is elsewhere acknowledged.

Examples

```
data(testdata2)
data_swap <- rankSwap(testdata2, variables=c("age", "income", "expend", "savings"))

## for objects of class sdcMicro:
```

```

data(testdata2)
sdc <- createSdcObj(testdata2,
  keyVars=c('urbrur', 'roof', 'walls', 'water', 'electcon', 'relat', 'sex'),
  numVars=c('expend', 'income', 'savings'), w='sampling_weight')
sdc <- rankSwap(sdc)

```

readMicrodata	<i>readMicrodata</i>
---------------	----------------------

Description

reads data from various formats into R. Used in [sdcApp](#).

Usage

```

readMicrodata(path, type, convertCharToFac = TRUE,
  drop_all_missings = TRUE, ...)

```

Arguments

path	a file path
type	which format does the file have. currently allowed values are <ul style="list-style-type: none"> • sas • spss • stata • R • rdf • csv
convertCharToFac	(logical) if TRUE, all character vectors are automatically converted to factors
drop_all_missings	(logical) if TRUE, all variables that contain NA-values only will be dropped
...	additional parameters. Currently used only if type='csv' to pass arguments to <code>read.table()</code> .

Value

a data.frame or an object of class 'simple.error'. If a stata file was read in, the resulting data.frame has an additional attribute `lab` in which variable and value labels are stored.

Note

if type is either 'sas', 'spss' or 'stata', values read in as NaN will be converted to NA.

Author(s)

Bernhard Meindl

removeDirectID	<i>Remove certain variables from the data set inside a sdc object.</i>
----------------	--

Description

Delete variables without changing anything else in the sdcObject (writing NAs).

Usage

```
removeDirectID(obj, var)
```

Arguments

obj	object of class sdcMicroObj-class
var	name of the variable(s) to be remove

Value

the modified [sdcMicroObj-class](#)

Author(s)

Alexander Kowarik

Examples

```
## for objects of class sdcMicro:
data(testdata2)
sdc <- createSdcObj(testdata, keyVars=c('urbrur','roof'),
  numVars=c('expend','income','savings'), w='sampling_weight')
sdc <- removeDirectID(sdc, var="age")
```

report	<i>Generate an Html-report from an sdcMicroObj</i>
--------	--

Description

Summary statistics of the original and the perturbed data set

Usage

```
report(obj, outdir = getwd(), filename = "SDC-Report",
  title = "SDC-Report", internal = FALSE, verbose = FALSE)
```

Arguments

obj	an object of class <code>sdcMicroObj-class</code> or <code>reportObj</code>
outdir	output folder
filename	output filename
title	Title for the report
internal	TRUE/FALSE, if TRUE a detailed internal report is produced, else a non-disclosive overview
verbose	TRUE/FALSE, if TRUE, some additional information is printed.

Details

The application of this function provides you with a html-report for your `sdcMicro` object that contains useful summaries about the anonymization process.

Author(s)

Matthias Templ, Bernhard Meindl

Examples

```
## Not run:
data(testdata2)
sdcc <- createSdcObj(testdata2,
  keyVars=c('urbrur','roof','walls','water','electcon','relat','sex'),
  numVars=c('expend','income','savings'), w='sampling_weight')
report(sdcc)

## End(Not run)
```

riskyCells

riskyCells

Description

Allows to compute risky (unweighted) combinations of key variables either up to a specified dimension or using identification level. This mimics the approach taken in `mu-argus`.

Usage

```
riskyCells(obj, useIdentificationLevel = FALSE, threshold, ...)
```

Arguments

- `obj` a `data.frame`, `data.table` or an object of class `sdcMicroObj-class`
- `useIdentificationLevel` (logical) specifies if tabulation should be done up to a specific dimension (`useIdentificationLevel=FALSE` using argument `maxDim`) or taking identification levels (`useIdentificationLevel=FALSE` using argument `level`) into account.
- `threshold` a numeric vector specifying the thresholds at which cells are considered to be unsafe. In case a tabulation is done up to a specific level (`useIdentificationLevel=FALSE`), the thresholds may be specified differently for each dimension. In the other case, the same threshold is used for all tables.
- ... see possible arguments below
- `keyVars`: index or variable-names within `obj` that should be used for tabulation. In case `obj` is of class `sdcMicroObj-class`, this argument is not used and the pre-defined key-variables are used.
 - `level`: in case `useIdentificationLevel=TRUE`, this numeric vector specifies the importance of the key variables. The construction of output tables follows the implementation in `mu-argus`, see e.g. <http://neon.vb.cbs.nl/casc/Software/MUmanual15.1.pdf>. The length of this numeric vector must match the number of key variables.
 - `maxDim`: in case `useIdentificationLevel=FALSE`, this number specifies maximal number of variables to tabulate.

Value

a `data.table` showing the number of unsafe cells, thresholds for any combination of the key variables. If the input was a `sdcMicroObj-class` object and some modifications have been already applied to the categorical key variables, the resulting output contains the number of unsafe cells both for the original and the modified data.

Author(s)

Bernhard Meindl

Examples

```
## Not run:
## data.frame method / all combinations up to maxDim
riskyCells(testdata2, keyVars=c(1:5), threshold=c(50,25,10,5),
  useIdentificationLevel=FALSE, maxDim=4)
riskyCells(testdata2, keyVars=c(1:5), threshold=10,
  useIdentificationLevel=FALSE, maxDim=3)

## data.frame method / using identification levels
riskyCells(testdata2, keyVars=c(1:6), threshold=20,
  useIdentificationLevel=TRUE, level=c(1,1,2,3,3,5))
riskyCells(testdata2, keyVars=c(1,3,4,6), threshold=10,
  useIdentificationLevel=TRUE, level=c(1,2,2,4))
```

```

## sdcMicroObj-method / all combinations up to maxDim
testdata2[1:6] <- lapply(1:6, function(x) {
  testdata2[[x]] <- as.factor(testdata2[[x]])
})
sdc <- createSdcObj(testdata2,
  keyVars=c('urbrur','roof','walls','water','electcon','relat','sex'),
  numVars=c('expend','income','savings'), w='sampling_weight')

r0 <- riskyCells(sdc, useIdentificationLevel=FALSE, threshold=c(20,10,5), maxDim=3)
## in case key-variables have been modified, we get counts for original and modified data
sdc <- groupAndRename(sdc, var="roof", before=c("5","6","9"), after=c("5+"))
r1 <- riskyCells(sdc, useIdentificationLevel=FALSE, threshold=c(10,5,3), maxDim=3)

## sdcMicroObj-method / using identification levels
riskyCells(sdc, useIdentificationLevel=TRUE, threshold=10, level=c(c(1,1,3,4,5,5,5)))

## End(Not run)

```

sdcApp

sdcApp

Description

starts the graphical user interface developed with *shiny*.

Usage

```
sdcApp(maxRequestSize = 50, debug = FALSE, theme = "IHSN", ...,
  shiny.server = FALSE)
```

Arguments

maxRequestSize	(numeric) number defining the maximum allowed filesize (in megabytes) for uploaded files, defaults to 50MB
debug	logical if TRUE, set shiny-debugging options
theme	select stylesheet for the interface. Supported choices are <ul style="list-style-type: none"> • 'yeti' • 'flatly' • 'journal' • 'IHSN'
...	arguments (e.g host) that are passed through runApp when starting the shiny application
shiny.server	Setting this parameter to TRUE will return the app in the form of an object rather than invoking it. This is useful for deploying sdcApp via shiny-server.

Value

starts the interactive graphical user interface which may be used to perform the anonymisation process.

Examples

```
## Not run:
sdcApp(theme="flatly")

## End(Not run)
```

```
sdcMicroObj-class      Class "sdcMicroObj"
```

Description

Class to save all information about the SDC process

Usage

```
createSdcObj(dat, keyVars, numVars = NULL, pramVars = NULL,
  ghostVars = NULL, weightVar = NULL, hhId = NULL,
  strataVar = NULL, sensibleVar = NULL, excludeVars = NULL,
  options = NULL, seed = NULL, randomizeRecords = FALSE, alpha = 1)

undolast(object)

strataVar(object) <- value

## S4 replacement method for signature 'sdcMicroObj,characterOrNULL'
strataVar(object) <- value
```

Arguments

dat	The microdata set. A numeric matrix or data frame containing the data.
keyVars	Indices or names of categorical key variables. They must, of course, match with the columns of 'dat'.
numVars	Index or names of continuous key variables.
pramVars	Indices or names of categorical variables considered to be pramed.
ghostVars	if specified a list which each element being a list of exactly two elements. The first element must be a character vector specifying exactly one variable name that was also specified as a categorical key variable (keyVars), while the second element is a character vector of valid variable names (that must not be listed as keyVars). If localSuppression or kAnon was applied, the resulting suppression pattern for each key-variable is transferred to the depending variables.
weightVar	Indices or name determining the vector of sampling weights.

hhId	Index or name of the cluster ID (if available).
strataVar	Indices or names of stratification variables.
sensibleVar	Indices or names of sensible variables (for I-diversity)
excludeVars	which variables of dat should not be included in result-object? Users may specify a vector of variable-names available in dat that were not specified in either keyVars, numVars, pramVars, ghostVars, hhId, strataVar or sensibleVar.
options	additional options (if specified, a list must be used as input)
seed	(numeric) number specifying the seed which will be set to allow for reproducibility. The number will be rounded and saved as element seed in slot options.
randomizeRecords	(logical) if TRUE, the order of observations in the input microdata set will be randomized.
alpha	numeric between 0 and 1 specifying the fraction on how much keys containing NAs should contribute to the frequency calculation which is also crucial for risk-estimation.
object	a <code>sdcMicroObj-class</code> object
value	NULL or a character vector of length 1 specifying a valid variable name

Value

a `sdcMicroObj-class` object
 an object of class `sdcMicroObj` with modified slot `@strataVar`

Objects from the Class

Objects can be created by calls of the form `new("sdcMicroObj", ...)`.

```

selectHouseholdData *Creates a household level file from a dataset with a household structure.*

Description

It removes individual level variables and selects one record per household based on a household ID. The function can also be used for other hierarchical structures.

Usage

```
selectHouseholdData(dat, hhId, hhVars)
```

Arguments

dat	a data.frame with the full dataset
hhId	name of the variable with the household (cluster) ID
hhVars	character vector with names of all household level variables

Value

a data.frame with only household level variables and one record per household

Note

It is of great importance that users select a variable with containing information on household-ids and weights in hhVars.

Author(s)

Thijs Benschop and Bernhard Meindl

Examples

```
## ori-hid: household-ids; household_weights: sampling weights for households
x_hh <- selectHouseholdData(dat=testdata, hhId="ori_hid",
  hhVars=c("urbrur", "roof", "walls", "water", "electcon", "household_weights"))
```

set.sdcMicroObj	set.sdcMicroObj
-----------------	-----------------

Description

modify `sdcMicroObj-class`-objects depending on argument type

Usage

```
set.sdcMicroObj(object, type, input)
```

Arguments

object	a <code>sdcMicroObj-class</code> -object
type	<p>a character vector of length 1 defining what to calculate return modify. Allowed types are listed below and the slot with the corresponding name will be replaced by the content of input.</p> <ul style="list-style-type: none"> • origData: • keyVars: • pramVars: • numVars: • weightVar: • hhId: • strataVar: • sensibleVar: • manipPramVars: • manipNumVars: • manipGhostVars: • manipStrataVar: • risk: • utility: • pram: • localSuppression: • options: • prev:

- set:
- additionalResults:
- deletedVars:

input a list depending on argument type. The content of the list must match the allowed data-type of the slot in the `sdcMicroObj-class`-object that should be replaced.

Value

a `sdcMicroObj-class`-object

Examples

```
sdc <- createSdcObj(testdata2,

ind_pram <- match(c("sex"), colnames(testdata2))
get.sdcMicroObj(sdc, type="pramVars")
sdc <- set.sdcMicroObj(sdc, type="pramVars", input=list(ind_pram))
get.sdcMicroObj(sdc, type="pramVars")
```

show,sdcMicroObj-method

Show

Description

show a `sdcMicro` object

Usage

```
## S4 method for signature 'sdcMicroObj'
show(object)
```

Arguments

object an `sdcmicro` obj

Value

a `sdcMicro` object

Author(s)

Bernhard Meindl

 shuffle

Shuffling and EGADP

Description

Data shuffling and General Additive Data Perturbation.

Usage

```
shuffle(obj, form, method = "ds", weights = NULL,
        covmethod = "spearman", regmethod = "lm", gadp = TRUE)
```

Arguments

obj	An object of class <code>sdcMicroObj</code> or a <code>data.frame</code> including the data.
form	An object of class "formula" (or one that can be coerced to that class): a symbolic description of the model to be fitted. The responses have to consists of at least two variables of any class and the response variables have to be of class numeric. The response variables belongs to numeric key variables (quasi-identifiers of numeric scale). The predictors are can be distributed in any way (numeric, factor, ordered factor).
method	currently either the original form of data shuffling ("ds" - default), "mvn" or "mlm", see the details section. The last method is in experimental mode and almost untested.
weights	Survey sampling weights. Automatically chosen when obj is of class <code>sdcMicroObj-class</code> .
covmethod	Method for covariance estimation. "spearman", "pearson" and "dQuotemcd" are possible. For the latter one, the implementation in package <code>robustbase</code> is used.
regmethod	Method for multivariate regression. "lm" and "MM" are possible. For method "MM", the function "rlm" from package <code>MASS</code> is applied.
gadp	TRUE, if the egadp results from a fit on the origianl data is returned.

Details

Perturbed values for the sensitive variables are generated. The sensitive variables have to be stored as responses in the argument 'form', which is the usual formula interface for regression models in R.

For method "ds" the EGADP method is applied on the norm inverse percentiles. Shuffling then ranks the original values according to the GADP output. For further details, please see the references.

Method "mvn" uses a simplification and draws from the normal Copulas directly before these draws are shuffled.

Method "mlm" is also a simplification. A linear model is applied the expected values are used as the perturbed values before shuffling is applied.

Value

If 'obj' is of class `sdcMicroObj-class` the corresponding slots are filled, like `manipNumVars`, `risk` and `utility`. If 'obj' is of class "data.frame" an object of class "micro" with following entities is returned:

<code>shConf</code>	the shuffled numeric key variables
<code>egadp</code>	the perturbed (using <code>gadp</code> method) numeric key variables

Note

In this version, the covariance method chosen is used for any covariance and correlation estimations in the whole `gadp` and shuffling function.

  form=savings+expend ~ urbrur+walls)
```

subsetMicrodata	<i>subsetMicrodata</i>
-----------------	------------------------

Description

allows to restrict original data to only a subset. This may be useful to test some anonymization methods. This function will only be used in the graphical user interface [sdcApp](#).

Usage

```
subsetMicrodata(obj, type, n)
```

Arguments

obj	an object of class data.frame containing micro data
type	algorithm used to sample from original microdata. Currently supported choices are <ul style="list-style-type: none"> • <code>n_perc</code> the restricted microdata will be a n-percent sample of the original microdata. • <code>first_n</code> only the first n observations will be used. • <code>every_n</code> the restricted microdata set consists of every n-th record. • <code>size_n</code> a total of n observations will be randomly drawn.
n	numeric vector of length 1 specifying the specific parameter with respect to argument type.

Value

an object of class [sdcMicroObj-class](#) with modified slot `@origData`.

Author(s)

Bernhard Meindl

suda2	<i>Suda2: Detecting Special Uniques</i>
-------	---

Description

SUDA risk measure for data from (stratified) simple random sampling.

Usage

```
suda2(obj, ...)
```

Arguments

<code>obj</code>	object of class <code>data.frame</code> or a <code>sdcMicroObj-class</code> -object
<code>...</code>	see arguments below <ul style="list-style-type: none"> • <code>variables</code>: Categorical (key) variables. Either the column names or and index of the variables to be used for risk measurement. • <code>missing</code>: Missing value coding in the given data set. • <code>DisFraction</code>: It is the sampling fraction for the simple random sampling, and the common sampling fraction for stratified sampling. By default, it's set to 0.01. • <code>original_scores</code>: if this argument is TRUE (the default), the suda-scores are computed as described in paper "SUDA: A Program for Detecting Special Uniques" by Elliot et al., if FALSE, the computation of the scores is slightly different as it was done in the original implementation of the algorithm by the IHSN.

Details

Suda 2 is a recursive algorithm for finding Minimal Sample Uniques. The algorithm generates all possible variable subsets of defined categorical key variables and scans them for unique patterns in the subsets of variables. The lower the amount of variables needed to receive uniqueness, the higher the risk of the corresponding observation.

Value

A modified `sdcMicroObj-class` object or the following list

- `ContributionPercent`: The contribution of each key variable to the SUDA score, calculated for each row.
- `score`: The suda score.
- `dissscore`: The dis suda score
- `attribute_contributions`: `data.frame` showing how much of the total risk is contributed by each variable. This information is stored in a `data.frame` in two variables:
 - `variable`: containing the name of the variable
 - `contribution`: contains how much risk a variable contributes to the total risk.
- `attribute_level_contributions`: shows risks of each attribute-level. this is saved in a `data.frame` with three columns.
 - `variable`: containing the name of the variable
 - `attribute`: holding relevant level-codes and
 - `contribution`: contains the risk of this level within the variable.)

Note

Since version >5.0.2, the computation of suda-scores has changed and is now by default as described in the original paper by Elliot et al.

Author(s)

Alexander Kowarik and Bernhard Meindl (based on the C++ code from the Organisation For Economic Co-Operation And Development).

For the C++ code: This work is being supported by the International Household Survey Network and funded by a DGF Grant provided by the World Bank to the PARIS21 Secretariat at the Organisation for Economic Co-operation and Development (OECD). This work builds on previous work which is elsewhere acknowledged.

summary.freqCalc

Summary method for objects from class freqCalc

Description

Summary method for objects of class ‘freqCalc’ to provide information about local suppressions.

Usage

```
## S3 method for class 'freqCalc'  
summary(object, ...)
```

Arguments

object	object from class freqCalc
...	Additional arguments passed through.

Details

Shows the amount of local suppressions on each variable in which local suppression was applied.

Value

Information about local suppression in each variable (only if a local suppression is already done).

summary.micro	<i>Summary method for objects from class micro</i>
---------------	--

Description

Summary method for objects from class 'micro'.

Usage

```
## S3 method for class 'micro'
summary(object, ...)
```

Arguments

object	objects from class micro
...	Additional arguments passed through.

Details

This function computes several measures of information loss, such as

Value

meanx	A conventional summary of the original data
meanxm	A conventional summary of the microaggregated data
amean	average relative absolute deviation of means
amedian	average relative absolute deviation of medians
aonestep	average relative absolute deviation of onestep from median
devvar	average relative absolute deviation of variances
amad	average relative absolute deviation of the mad
acov	average relative absolute deviation of covariances
arcov	average relative absolute deviation of robust (with mcd) covariances
acor	average relative absolute deviation of correlations
arcor	average relative absolute deviation of robust (with mcd) correlations
acors	average relative absolute deviation of rank-correlations
adlm	average absolute deviation of lm regression coefficients (without intercept)
adlts	average absolute deviation of lts regression coefficients (without intercept)
apcaload	average absolute deviation of pca loadings
appacaload	average absolute deviation of robust (with projection pursuit approach) pca loadings
atotals	average relative absolute deviation of totals
pmtotals	average relative deviation of totals

Tarragona

Tarragona data set

Description

A real data set comprising figures of 834 companies in the Tarragona area. Data correspond to year 1995.

Format

A data frame with 834 observations on the following 13 variables.

FIXED.ASSETS a numeric vector
CURRENT.ASSETS a numeric vector
TREASURY a numeric vector
UNCOMMITTED.FUNDS a numeric vector
PAID.UP.CAPITAL a numeric vector
SHORT.TERM.DEBT a numeric vector
SALES a numeric vector
LABOR.COSTS a numeric vector
DEPRECIATION a numeric vector
OPERATING.PROFIT a numeric vector
FINANCIAL.OUTCOME a numeric vector
GROSS.PROFIT a numeric vector
NET.PROFIT a numeric vector

Source

Public use data from the CASC project.

```

testdata

A real-world data set on household income and expenditures

Description

A concise (1-5 lines) description of the dataset.

Format

testdata: a data frame with 4580 observations on the following 15 variables.

urbrur a numeric vector

roof a numeric vector

walls a numeric vector

water a numeric vector

electcon a numeric vector

relat a numeric vector

sex a numeric vector

age a numeric vector

hheivil a numeric vector

expend a numeric vector

income a numeric vector

savings a numeric vector

ori_hid a numeric vector

sampling_weight a numeric vector

household_weights a numeric vector

testdata2: A data frame with 93 observations on the following 19 variables.

urbrur a numeric vector
roof a numeric vector
walls a numeric vector
water a numeric vector
electcon a numeric vector
relat a numeric vector
sex a numeric vector
age a numeric vector
hhcivil a numeric vector
expend a numeric vector
income a numeric vector
savings a numeric vector
ori_hid a numeric vector
sampling_weight a numeric vector
represent a numeric vector
category_count a numeric vector
relat2 a numeric vector
water2 a numeric vector
water3 a numeric vector

head(testdata2)
```

topBotCoding

Top and Bottom Coding

Description

Function for Top and Bottom Coding.

Usage

```
topBotCoding(obj, value, replacement, kind = "top", column = NULL)
```

Arguments

obj	a numeric vector, a data.frame or a <code>sdcMicroObj-class</code> -object
value	limit, from where it should be top- or bottom-coded
replacement	replacement value.
kind	top or bottom
column	variable name in case the input is a data.frame or an object of class <code>sdcMicroObj-class</code> .

Details

Extreme values larger or lower than value are replaced by a different value (replacement in order to reduce the disclosure risk).

Value

Top or bottom coded data or modified `sdcMicroObj-class`.

Note

top-/bottom coding of factors is no longer possible as of `sdcMicro` $\geq 4.7.0$

testdata <- topBotCoding(testdata, value=80, replacement=81, kind="top", column="age")
range(testdata$age)

## for objects of class sdcMicro:
data(testdata2)
sdc <- createSdcObj(testdata2, keyVars=c('urbrur', 'roof', 'walls', 'water', 'electcon', 'relat', 'sex'),
  numVars=c('expend', 'income', 'savings'), w='sampling_weight')
sdc <- topBotCoding(sdc, value=500000, replacement=1000, column="income")
testdataout <- extractManipData(sdc)
```

 valTable

Comparison of different microaggregation methods

Description

A Function for the comparison of different perturbation methods.

Usage

```
valTable(x, method = c("simple", "onedims", "clustppca",
  "addNoise: additive", "swappNum"), measure = "mean",
  clustermethod = "clara", aggr = 3, nc = 8, transf = "log",
  p = 15, noise = 15, w = 1:dim(x)[2], delta = 0.1)
```

Arguments

x	data frame or matrix
method	microaggregation methods or adding noise methods or rank swapping.
measure	FUN for aggregation. Possible values are mean (default), median, trim, onestep.
clustermethod	clustermethod, if a method will need a clustering procedure
aggr	aggregation level (default=3)
nc	number of clusters. Necessary, if a method will need a clustering procedure
transf	Transformation of variables before clustering.
p	Swapping range, if method swappNum has been chosen
noise	noise addition, if an addNoise method has been chosen
w	variables for swapping, if method swappNum has been chosen
delta	parameter for adding noise method 'correlated2'

Details

Tabularise the output from summary.micro. Will be enhanced to all perturbation methods in future versions.

Value

Measures of information loss splitted for the comparison of different methods.

Methods for adding noise should be named via "addNoise: method", e.g. "addNoise: correlated", i.e. the term 'at first' then followed by a ':' and a blank and then followed by the name of the method as described in function 'addNoise'.

varToFactor	<i>Change the a keyVariable of an object of class sdcMicroObj-class from Numeric to Factor or from Factor to Numeric</i>
-------------	--

Description

Change the scale of a variable

Usage

```
varToFactor(obj, var)

varToNumeric(obj, var)
```

Arguments

obj	object of class sdcMicroObj-class
var	name of the keyVariable to change

Value

the modified [sdcMicroObj-class](#)

Examples

```
## for objects of class sdcMicro:
data(testdata2)
sdc <- createSdcObj(testdata2,
  keyVars=c('urbrur','roof','walls','water','electcon','relat','sex'),
  numVars=c('expend','income','savings'), w='sampling_weight')
sdc <- varToFactor(sdc, var="urbrur")
```

writeSafeFile	<i>writeSafeFile</i>
---------------	----------------------

Description

writes an anonymized dataset to a file. This function should be used in the graphical user interface [sdcApp](#) only.

Usage

```
writeSafeFile(obj, format, randomizeRecords, fileOut, ...)
```

Arguments

obj	an object of class data.frame containing micro data
format	(character) specifies the output file format. Accepted values are: <ul style="list-style-type: none"> • 'rdata' output will be saved in the R binary file-format. • 'sav' output will be saved as SPSS-file. • 'dta' output will be saved as STATA-file. • 'csv' output will be saved as comma seperated (text)-file. • 'sas' output will be saved as SAS-file (sas7bdat).
randomizeRecords	(logical) specifies, if the output records should be randomized. The following options are possible: <ul style="list-style-type: none"> • 'no' default, no randomization takes place • 'simple' records are just randomly swapped. • 'byHH' if slot 'hhId' is not NULL, the clusters defined by this variable are randomized across the dataset. If slot 'hhId' is NULL, the records or the dataset are randomly changed. • 'withinHH' if slot 'hhId' is not NULL, the clusters defined by this variable are randomized across the dataset and additionally, the order of records within the clusters are also randomly changed. If slot 'hhId' is NULL, the records or the dataset are randomly changed.
fileOut	(character) file to which output should be written
...	optional arguments used for <code>write.table</code> if argument format equals csv
