

# Package ‘shinyMatrix’

May 20, 2021

**Title** Shiny Matrix Input Field

**Version** 0.6.0

**Author** Andreas Neudecker

**Maintainer** Andreas Neudecker <[andreas.neudecker@inwt-statistics.de](mailto:andreas.neudecker@inwt-statistics.de)>

**Description** Implements a custom matrix input field.

**Depends** R (>= 3.5)

**License** MIT + file LICENSE

**Encoding** UTF-8

**Imports** shiny, jsonlite

**Suggests** testthat, covr

**RoxygenNote** 7.1.0

**NeedsCompilation** no

**Repository** CRAN

**Date/Publication** 2021-05-20 16:40:02 UTC

## R topics documented:

matrixInput . . . . .	1
startApplication . . . . .	3
updateMatrixInput . . . . .	4

---

matrixInput	<i>Create a matrix input field</i>
-------------	------------------------------------

---

## Description

Use this function to create a matrix input field. Typically this would be in the ‘ui.R‘ file of your shiny application. You can access the input via the ‘input\$inputId‘ in the server function of the shiny application. The value will always be a matrix and contain values of class ‘class‘.

## Usage

```
matrixInput(
  inputId,
  label = NULL,
  value = matrix("", 1, 1),
  inputClass = "",
  rows = list(),
  cols = list(),
  class = "character",
  paste = FALSE,
  copy = FALSE,
  copyDoubleClick = FALSE,
  pagination = FALSE,
  lazy = FALSE
)
```

## Arguments

<code>inputId</code>	The input slot that will be used to access the value
<code>label</code>	label for input field
<code>value</code>	Initial value. Should be a matrix
<code>inputClass</code>	class of the matrix input html element
<code>rows</code>	list of options to configure rows
<code>cols</code>	list of options to configure cols
<code>class</code>	Matrix will be coerced to a matrix of this class. ‘character’ and ‘numeric’ are supported
<code>paste</code>	old argument
<code>copy</code>	old argument
<code>copyDoubleClick</code>	old argument
<code>pagination</code>	Use pagination to display matrix
<code>lazy</code>	lazy updating of server values. The new values are only sent to the server when no input field is visible

## Details

The parameters ‘rows’ and ‘cols’ take a list of arguments. Currently, the following arguments are supported:

- n** number of rows (is calculated from value as default)
- names** should row/colnames be displayed? The names are taken from value
- editableNames** should row/colnames be editable
- extend** Should the matrix be extended if data is entered in the last row/column?
- delta** how many blank rows/cols should be added?

**createHeader, updateHeader** name of javascript function to override default function to create/update table header. The function needs to have the table element and the data object as argument

**getHeader** same as createHeader but with table element as only argument

## Examples

```
matrixInput(  
  "myMatrix",  
  value = diag(3),  
  rows = list(names = FALSE),  
  cols = list(names = FALSE)  
)
```

---

startApplication	<i>Start Application</i>
------------------	--------------------------

---

## Description

This function starts an example app from the folder ‘inst’.

## Usage

```
startApplication(app = "app", port = 4242)
```

## Arguments

app	name of the folder in ‘inst’
port	port of web application

## Examples

```
## Not run:  
startApplication("appCopy")  
  
## End(Not run)
```

---

updateMatrixInput      *Update matrix input*

---

## Description

This function updates the matrix input from R created with ‘matrixInput’. It works like the other updateXXXInput functions in shiny.

## Usage

```
updateMatrixInput(session, inputId, value)
```

## Arguments

session	shiny session
inputId	id of matrix input
value	new value for matrix

## Examples

```
## Not run:  
updateMatrixInput(session, "myMatrix", diag(4))  
  
## End(Not run)
```
