Description

Statistical packages exhibit substantial diversity in terms of their syntax and expected input type. This can make it difficult to switch from one statistical approach to another. For example, some functions expect vectors as inputs, while others expect dataframes. Depending on whether it is a repeated measures design or not, different functions might expect data to be in wide or long format. Some functions can internally omit missing values, while other functions error in their presence. Furthermore, if someone wishes to utilize the objects returned by these packages downstream in their workflow, this is not straightforward either because even functions from the same package can return a list, a matrix, an array, a dataframe, etc., depending on the function.
This is where \{statsExpressions\} comes in: It can be thought of as a unified portal through which most of the functionality in these underlying packages can be accessed, with a simpler interface and no requirement to change data format.

This package forms the statistical processing backend for \texttt{ggstatsplot} package.

For more documentation, see the dedicated \texttt{Website}.

\textit{Tidy version of the "Bugs" dataset.}
\end{verse}

\section*{Description}

Tidy version of the "Bugs" dataset.

\section*{Usage}

\texttt{bugs_long}

\section*{Format}

A data frame with 372 rows and 6 variables:

- \texttt{subject}. Dummy identity number for each participant.
- \texttt{gender}. Participant's gender (Female, Male).
- \texttt{region}. Region of the world the participant was from.
- \texttt{education}. Level of education.
- \texttt{condition}. Condition of the experiment the participant gave rating for (\textbf{LDLF}: low freighteningness and low disgustingness; \textbf{LFHD}: low freighteningness and high disgustingness; \textbf{HFHD}: high freighteningness and low disgustingness; \textbf{HFHD}: high freighteningness and high disgustingness).
- \texttt{desire}. The desire to kill an arthropod was indicated on a scale from 0 to 10.
**Details**

This data set, "Bugs", provides the extent to which men and women want to kill arthropods that vary in frighteningness (low, high) and disgustingness (low, high). Each participant rates their attitudes towards all anthropods. Subset of the data reported by Ryan et al. (2013).

**Source**

**Examples**

```r
dim(bugs_long)
head(bugs_long)
dplyr::glimpse(bugs_long)
```

---

**centrality_description**

_Dataframe and expression for distribution properties_

**Description**

Dataframe and expression for distribution properties

**Usage**

```r
centrality_description(data, x, y, type = "parametric", tr = 0.2, k = 2L, ...)
```

**Arguments**

- **data**
  A dataframe (or a tibble) from which variables specified are to be taken. Other data types (e.g., matrix, table, array, etc.) will not be accepted.

- **x**
  The grouping (or independent) variable from the dataframe data.

- **y**
  The response (or outcome or dependent) variable from the dataframe data.

- **type**
  A character specifying the type of statistical approach:
  - "parametric"
  - "nonparametric"
  - "robust"
  - "bayes"

  You can specify just the initial letter.

- **tr**
  Trim level for the mean when carrying out robust tests. In case of an error, try reducing the value of tr, which is by default set to 0.2. Lowering the value might help.

- **k**
  Number of digits after decimal point (should be an integer) (Default: k = 2L).

- **...**
  Currently ignored.
Details
This function describes a distribution for y variable for each level of the grouping variable in x by a set of indices (e.g., measures of centrality, dispersion, range, skewness, kurtosis). It additionally returns an expression containing a specified centrality measure. The function internally relies on datawizard::describe_distribution function.

Examples
set.seed(123)

# parametric -----------------------
centrality_description(iris, Species, Sepal.Length)

# non-parametric -------------------
centrality_description(mtcars, am, wt, type = "n")

# robust ---------------------------
centrality_description(ToothGrowth, supp, len, type = "r")

# Bayesian -------------------------
centrality_description(sleep, group, extra, type = "b")

counting_table

Description
A dataframe containing results from for contingency table analysis or goodness of fit test.
To see details about functions which are internally used to carry out these analyses, see the following vignette- https://indrajeetpatil.github.io/statsExpressions/articles/stats_details.html

Usage
counting_table(
  data,  
  x,  
  y = NULL,  
  paired = FALSE,  
  type = "parametric",  
  counts = NULL,  
  ratio = NULL,  
  k = 2L,  
  conf.level = 0.95,  
  sampling.plan = "indepMulti",  
  fixed.margin = "rows",  
  prior.concentration = 1,
Arguments

data A dataframe (or a tibble) from which variables specified are to be taken. Other data types (e.g., matrix, table, array, etc.) will not be accepted.

x The variable to use as the rows in the contingency table.

y The variable to use as the columns in the contingency table. Default is NULL. If NULL, one-sample proportion test (a goodness of fit test) will be run for the x variable. Otherwise association test will be carried out.

paired Logical indicating whether data came from a within-subjects or repeated measures design study (Default: FALSE). If TRUE, McNemar’s test expression will be returned. If FALSE, Pearson’s chi-square test will be returned.

type A character specifying the type of statistical approach:
  • "parametric"
  • "nonparametric"
  • "robust"
  • "bayes"

You can specify just the initial letter.

counts A string naming a variable in data containing counts, or NULL if each row represents a single observation.

ratio A vector of proportions: the expected proportions for the proportion test (should sum to 1). Default is NULL, which means the null is equal theoretical proportions across the levels of the nominal variable. This means if there are two levels this will be ratio = c(0.5, 0.5) or if there are four levels this will be ratio = c(0.25, 0.25, 0.25, 0.25), etc.

k Number of digits after decimal point (should be an integer) (Default: k = 2L).

conf.level Scalar between 0 and 1. If unspecified, the defaults return 95% confidence/credible intervals (0.95).

sampling.plan Character describing the sampling plan. Possible options are "indepMulti" (independent multinomial; default), "poisson", "jointMulti" (joint multinomial), "hypergeom" (hypergeometric). For more, see ?BayesFactor::contingencyTableBF().

fixed.margin For the independent multinomial sampling plan, which margin is fixed ("rows" or "cols"). Defaults to "rows".

prior.concentration Specifies the prior concentration parameter, set to 1 by default. It indexes the expected deviation from the null hypothesis under the alternative, and corresponds to Gunel and Dickey's (1974) "a" parameter.

top.text Text to display on top of the Bayes Factor message. This is mostly relevant in the context of ggstatsplot package functions.

Additional arguments (currently ignored).
Examples

# for reproducibility
set.seed(123)
library(statsExpressions)
options(tibble.width = Inf, pillar.bold = TRUE, pillar.neg = TRUE)

# ------------------------ non-Bayesian -----------------------------

# association test
contingency_table(
  data = mtcars,
  x = am,
  y = cyl,
  paired = FALSE
)

# goodness-of-fit test
contingency_table(
  data = as.data.frame(HairEyeColor),
  x = Eye,
  counts = Freq,
  ratio = c(0.2, 0.2, 0.3, 0.3)
)

# ------------------------ Bayesian -----------------------------

# association test
contingency_table(
  data = mtcars,
  x = am,
  y = cyl,
  paired = FALSE,
  type = "bayes"
)

# goodness-of-fit test
contingency_table(
  data = as.data.frame(HairEyeColor),
  x = Eye,
  counts = Freq,
  ratio = c(0.2, 0.2, 0.3, 0.3),
  type = "bayes"
)
Description

A dataframe containing results from correlation test with confidence intervals for the correlation coefficient estimate.

Usage

corr_test(
  data,
  x,
  y,
  type = "parametric",
  k = 2L,
  conf.level = 0.95,
  tr = 0.2,
  bf.prior = 0.707,
  top.text = NULL,
  ...
)

Arguments

data A dataframe (or a tibble) from which variables specified are to be taken. Other data types (e.g., matrix, table, array, etc.) will not be accepted.
x The column in data containing the explanatory variable to be plotted on the x-axis.
y The column in data containing the response (outcome) variable to be plotted on the y-axis.
type A character specifying the type of statistical approach:
  • "parametric"
  • "nonparametric"
  • "robust"
  • "bayes"
You can specify just the initial letter.
k Number of digits after decimal point (should be an integer) (Default: k = 2L).
conf.level Scalar between 0 and 1. If unspecified, the defaults return 95% confidence/credible intervals (0.95).
tr Trim level for the mean when carrying out robust tests. In case of an error, try reducing the value of tr, which is by default set to 0.2. Lowering the value might help.
bf.prior A number between 0.5 and 2 (default 0.707), the prior width to use in calculating Bayes factors and posterior estimates. In addition to numeric arguments, several named values are also recognized: "medium", "wide", and "ultrawide", corresponding to r scale values of 1/2, sqrt(2)/2, and 1, respectively. In case of an ANOVA, this value corresponds to scale for fixed effects.
expr_template

  top.text  Text to display on top of the Bayes Factor message. This is mostly relevant in the context of ggstatsplot package functions.

  ...  Additional arguments (currently ignored).

References

To see details about functions which are internally used to carry out these analyses, see the following vignette- [https://indrajeetpatil.github.io/statsExpressions/articles/stats_details.html](https://indrajeetpatil.github.io/statsExpressions/articles/stats_details.html)

Examples

```r
# for reproducibility
set.seed(123)
library(statsExpressions)
options(tibble.width = Inf, pillar.bold = TRUE, pillar.neg = TRUE)

# without changing defaults
corr_test(
  data = ggplot2::midwest,
  x = area,
  y = percblack
)

# changing defaults
corr_test(
  data = ggplot2::midwest,
  x = area,
  y = percblack,
  type = "robust"
)
```

expr_template  Template for expressions with statistical details

Description

Creates an expression from a dataframe containing statistical details. Ideally, this dataframe would come from having run tidy_model_parameters function on your model object.

This function is currently not stable and should not be used outside of this package context.

Usage

```r
expr_template(
  data,
  paired = FALSE,
```
bayesian = FALSE,
no.parameters = 0L,
statistic.text = NULL,
effsize.text = NULL,
top.text = NULL,
prior.distribution = NULL,
prior.type = NULL,
n = NULL,
n.text = ifelse(paired, list(quote(italic("n")["pairs"])),
   list(quote(italic("n")["obs"])))[[1]],
conf.method = "HDI",
k = 2L,
k.df = 0L,
k.df.error = 0L,
...)

Arguments

data A dataframe containing details from the statistical analysis and should contain some or all of the following columns:

- statistic: the numeric value of a statistic.
- df.error: the numeric value of a parameter being modeled (often degrees of freedom for the test); note that if no.parameters = 0L (e.g., for non-parametric tests), this column will be irrelevant.
- df: relevant only if the statistic in question has two degrees of freedom.
- p.value: the two-sided p-value associated with the observed statistic.
- method: method describing the test carried out.
- effectsize: name of the effect size (if not present, same as method).
- estimate: estimated value of the effect size.
- conf.level: width for the confidence intervals.
- conf.low: lower bound for effect size estimate.
- conf.high: upper bound for effect size estimate.
- bf10: Bayes Factor value (if bayesian = TRUE).

paired Logical that decides whether the experimental design is repeated measures/within-subjects or between-subjects. The default is FALSE.

bayesian Is this Bayesian analysis? Defaults to FALSE. The template is slightly different for Bayesian analysis.

no.parameters An integer that specifies that the number of parameters for the statistical test. Can be 0 for non-parametric tests, 1 for tests based on t-statistic or chi-squared statistic, 2 for tests based on F-statistic.

statistic.text A character that specifies the relevant test statistic. For example, for tests with t-statistic, statistic.text = "t".

effsize.text A character that specifies the relevant effect size.

top.text Text to display on top of the Bayes Factor message. This is mostly relevant in the context of ggstatsplot package functions.
prior.distribution
A character that specifies the prior type.

prior.type
The type of prior.

n
An integer specifying the sample size used for the test.

n.text
A character that specifies the design, which will determine what the n stands for. It defaults to quote(italic("n")["pairs"])) if paired = TRUE, and to quote(italic("n")["obs"])) if paired = FALSE. If you wish to customize this further, you will need to provide object of language type.

conf.method
The type of index used for Credible Interval. Can be "hdi" (default), "eti", or "si" (see si(), hdi(), eti() functions from bayestestR package).

k
Number of digits after decimal point (should be an integer) (Default: k = 2L).

k.df, k.df.error
Number of decimal places to display for the parameters (default: 0).

... Currently ignored.

Examples

set.seed(123)

# creating a dataframe with stats results
stats_df <- cbind.data.frame(
  statistic = 5.494,
  df = 29.234,
  p.value = 0.00001,
  estimate = -1.980,
  conf.level = 0.95,
  conf.low = -2.873,
  conf.high = -1.088
)

# expression for *t*-statistic with Cohen's *d* as effect size
# note that the plotmath expressions need to be quoted
expr_template(
  no.parameters = 1L,
  data = stats_df,
  statistic.text = quote(italic("t")),
  effsize.text = quote(italic("d")),
  n = 32L,
  n.text = quote(italic("n")["no.obs"])),
  k = 3L,
  k.df = 3L
)
**Description**

Function to format an R object for pretty printing with a specified \((k)\) number of decimal places. The function also allows really small \(p\)-values to be denoted as \("p < 0.001"\) rather than \("p = 0.000"\). Note that if \(p\.value\) is set to TRUE, the minimum value of \(k\) allowed is 3. If \(k\) is set to less than 3, the function will ignore entered \(k\) value and use \(k = 3\) instead.

**Usage**

\[
\text{format_num}(x, k = 2L, p\.value = \text{FALSE}, \ldots)
\]

**Arguments**

- **x**: A numeric value.
- **k**: Number of digits after decimal point (should be an integer) (Default: \(k = 3L\)).
- **p\.value**: Decides whether the number is a \(p\)-value (Default: \text{FALSE}).
- **\ldots**: Currently ignored.

**Value**

Formatted numeric value.

**Note**

This function is **not** vectorized.

**Examples**

\[
\begin{align*}
\text{format_num}(0.0000123, k = 2, p\.value = \text{TRUE}) \\
\text{format_num}(0.008675, k = 2, p\.value = \text{TRUE}) \\
\text{format_num}(0.003458, k = 3, p\.value = \text{FALSE})
\end{align*}
\]

---

**iris_long**

*Edgar Anderson’s Iris Data in long format.*

**Description**

Edgar Anderson’s Iris Data in long format.

**Usage**

\[
\text{iris_long}
\]
Format
A data frame with 600 rows and 5 variables

- id. Dummy identity number for each flower (150 flowers in total).
- Species. The species are *Iris setosa*, *versicolor*, and *virginica*.
- attribute. What attribute is being measured ("Sepal" or "Petal").
- measure. What aspect of the attribute is being measured ("Length" or "Width").
- value. Value of the measurement.

Details
This famous (Fisher’s or Anderson’s) iris data set gives the measurements in centimeters of the variables sepal length and width and petal length and width, respectively, for 50 flowers from each of 3 species of iris. The species are *Iris setosa*, *versicolor*, and *virginica*.

This is a modified dataset from datasets package.

Examples
```r
dim(iris_long)
head(iris_long)
dplyr::glimpse(iris_long)
```

---

**long_to_wide_converter**

*Converts dataframe from long/tidy to wide format with NAs removed*

Description
This conversion is helpful mostly for repeated measures design, where removing NAs by participant can be a bit tedious.

It does not make sense to spread the dataframe to wide format when the measure is not repeated, so if `paired = TRUE`, `spread` argument will be ignored.

Usage
```
long_to_wide_converter(
  data,  
  x, 
  y, 
  subject.id = NULL, 
  paired = TRUE, 
  spread = TRUE, 
  ... 
)
```
Arguments

data A dataframe (or a tibble) from which variables specified are to be taken. Other data types (e.g., matrix, table, array, etc.) will not be accepted.
x The grouping (or independent) variable from the dataframe data. In case of a repeated measures or within-subjects design, if subject.id argument is not available or not explicitly specified, the function assumes that the data has already been sorted by such an id by the user and creates an internal identifier. So if your data is not sorted, the results can be inaccurate when there are more than two levels in x and there are NAs present. The data is expected to be sorted by user in subject-1, subject-2, ..., pattern.
y The response (or outcome or dependent) variable from the dataframe data.
subject.id Relevant in case of a repeated measures or within-subjects design (paired = TRUE, i.e.), it specifies the subject or repeated measures identifier. Important: Note that if this argument is NULL (which is the default), the function assumes that the data has already been sorted by such an id by the user and creates an internal identifier. So if your data is not sorted and you leave this argument unspecified, the results can be inaccurate when there are more than two levels in x and there are NAs present.
paired Logical that decides whether the experimental design is repeated measures/within-subjects or between-subjects. The default is FALSE.
spread Logical that decides whether the dataframe needs to be converted from long/tidy to wide (default: TRUE). Relevant only if paired = TRUE.
...
Currently ignored.

Value

A dataframe with NAs removed while respecting the between-or-within-subjects nature of the dataset.

Examples

# for reproducibility
library(statsExpressions)
set.seed(123)

# repeated measures design
long_to_wide_converter(
  data = bugs_long,
  x = condition,
  y = desire,
  subject.id = subject,
  paired = TRUE
)

# independent measures design
long_to_wide_converter(
  data = ggplot2::msleep,
  x = vore,
  y = brainwt,
**meta_analysis**

```r
  paired = FALSE
)
```

---

**Description**

A dataframe containing results from random-effects meta-analysis.

To see details about functions which are internally used to carry out these analyses, see the following vignette: [https://indrajeetpatil.github.io/statsExpressions/articles/stats_details.html](https://indrajeetpatil.github.io/statsExpressions/articles/stats_details.html)

**Usage**

```r
meta_analysis(
  data,  # A dataframe. It must contain columns named estimate (effect sizes or outcomes) and std.error (corresponding standard errors). These two columns will be used:
             # as yi and sei arguments in metafor::rma (for parametric test) or metaplus::metaplus (for robust test)
             # as y and SE arguments in metaBMA::meta_random (for Bayesian test).
  type = "parametric",  # A character specifying the type of statistical approach:
             # "parametric"
             # "nonparametric"
             # "robust"
             # "bayes"
             # You can specify just the initial letter.
  random = "mixture",  # The type of random effects distribution. One of "normal", "t-dist", "mixture", for standard normal, t-distribution or mixture of normals respectively.
  k = 2L,  # Number of digits after decimal point (should be an integer) (Default: k = 2L).
  conf.level = 0.95,  # Scalar between 0 and 1. If unspecified, the defaults return 95% confidence/credible intervals (0.95).
  top.text = NULL,
  ...
)
```

**Arguments**

- **data**
  - A dataframe. It **must** contain columns named `estimate` (effect sizes or outcomes) and `std.error` (corresponding standard errors). These two columns will be used:
    - as `yi` and `sei` arguments in `metafor::rma` (for **parametric** test) or `metaplus::metaplus` (for **robust** test)
    - as `y` and `SE` arguments in `metaBMA::meta_random` (for **Bayesian** test).

- **type**
  - A character specifying the type of statistical approach:
    - "parametric"
    - "nonparametric"
    - "robust"
    - "bayes"
    - You can specify just the initial letter.

- **random**
  - The type of random effects distribution. One of "normal", "t-dist", "mixture", for standard normal, t-distribution or mixture of normals respectively.

- **k**
  - Number of digits after decimal point (should be an integer) (Default: k = 2L).

- **conf.level**
  - Scalar between 0 and 1. If unspecified, the defaults return 95% confidence/credible intervals (0.95).
movies_long

# a dataframe with estimates and standard errors (`mag` dataset from `metaplus`)
df <-
structure(list(
  estimate = c(-0.8303483, -1.056053, -1.27834, -0.0434851, 0.2231435, -2.40752, -1.280934, -1.191703, -0.695748, -2.208274, -2.03816, -0.8501509, -0.7932307, -0.2993399, -1.570789, 0.0575873),
  std.error = c(1.24701799987009, 0.41407060026039, 0.808139200261935, 1.42950999996502, 0.489168400451215, 1.07220799987689, 1.1937340001022, 1.66129199992054, 0.536177600240816, 1.10964800004326, 0.700726300312728, 0.618448600127771, 0.62586199758383, 0.14657289950844, 0.574039500383031, 0.0316420922190679)
), row.names = c(NA, -16L), class = "data.frame")

# setup
set.seed(123)
library(statsExpressions)
options(tibble.width = Inf, pillar.bold = TRUE, pillar.neg = TRUE)

meta_analysis(df) # parametric
# meta_analysis(df, type = "random", random = "normal") # robust
# meta_analysis(df, type = "bayes") # Bayesian
movies_long

Description

Movie information and user ratings from IMDB.com (long format).

Usage

movies_long

Format

A data frame with 1,579 rows and 8 variables

- title. Title of the movie.
- year. Year of release.
- budget. Total budget (if known) in US dollars
- length. Length in minutes.
- rating. Average IMDB user rating.
- votes. Number of IMDB users who rated this movie.
- mpaa. MPAA rating.
- genre. Different genres of movies (action, animation, comedy, drama, documentary, romance, short).

Details

Modified dataset from ggplot2movies package.

The internet movie database, https://imdb.com/, is a website devoted to collecting movie data supplied by studios and fans. It claims to be the biggest movie database on the web and is run by amazon.

Movies were are identical to those selected for inclusion in movies_wide but this dataset has been constructed such that every movie appears in one and only one genre category.

Source

https://CRAN.R-project.org/package=ggplot2movies

Examples

dim(movies_long)
head(movies_long)
dplyr::glimpse(movies_long)
movies_wide

Movie information and user ratings from IMDB.com (wide format).

Description

Movie information and user ratings from IMDB.com (wide format).

Usage

movies_wide

Format

A data frame with 1,579 rows and 13 variables

- title. Title of the movie.
- year. Year of release.
- budget. Total budget in millions of US dollars
- length. Length in minutes.
- rating. Average IMDB user rating.
- votes. Number of IMDB users who rated this movie.
- mpaa. MPAA rating.
- action, animation, comedy, drama, documentary, romance, short. Binary variables representing if movie was classified as belonging to that genre.
- NumGenre. The number of different genres a film was classified in an integer between one and four.

Details

Modified dataset from ggplot2movies package.

The internet movie database, https://imdb.com/, is a website devoted to collecting movie data supplied by studios and fans. It claims to be the biggest movie database on the web and is run by amazon.

Movies were selected for inclusion if they had a known length and had been rated by at least one imdb user. Small categories such as documentaries and NC-17 movies were removed.

Examples

dim(movies_wide)
head(movies_wide)
dplyr::glimpse(movies_wide)
Description

A dataframe containing results for one-way ANOVA.

To see details about functions which are internally used to carry out these analyses, see the following vignette- [https://indrajeetpatil.github.io/statsExpressions/articles/stats_details.html](https://indrajeetpatil.github.io/statsExpressions/articles/stats_details.html)

Usage

```r
oneway_anova(
  data, x, y, subject.id = NULL, type = "parametric", paired = FALSE,
  k = 2L, conf.level = 0.95, effsize.type = "omega",
  var.equal = FALSE, bf.prior = 0.707, tr = 0.2,
  nboot = 100L, top.text = NULL, ...
)
```

Arguments

- **data**: A dataframe (or a tibble) from which variables specified are to be taken. Other data types (e.g., matrix, table, array, etc.) will not be accepted.

- **x**: The grouping (or independent) variable from the dataframe `data`. In case of a repeated measures or within-subjects design, if `subject.id` argument is not available or not explicitly specified, the function assumes that the data has already been sorted by such an id by the user and creates an internal identifier. So if your data is not sorted, the results can be inaccurate when there are more than two levels in `x` and there are NAs present. The data is expected to be sorted by user in subject-1, subject-2, ..., pattern.

- **y**: The response (or outcome or dependent) variable from the dataframe `data`.

- **subject.id**: Relevant in case of a repeated measures or within-subjects design (paired = TRUE, i.e.), it specifies the subject or repeated measures identifier. **Important**: Note that if this argument is NULL (which is the default), the function assumes that the data has already been sorted by such an id by the user and creates an
internal identifier. So if your data is not sorted and you leave this argument unspecified, the results can be inaccurate when there are more than two levels in \( x \) and there are NAs present.

**type**

A character specifying the type of statistical approach:

- "parametric"
- "nonparametric"
- "robust"
- "bayes"

You can specify just the initial letter.

**paired**

Logical that decides whether the experimental design is repeated measures/within-subjects or between-subjects. The default is FALSE.

**k**

Number of digits after decimal point (should be an integer) (Default: \( k = 2 \))

**conf.level**

Scalar between 0 and 1. If unspecified, the defaults return 95% confidence/credible intervals (0.95).

**effsize.type**

Type of effect size needed for parametric tests. The argument can be "eta" (partial eta-squared) or "omega" (partial omega-squared).

**var.equal**

a logical variable indicating whether to treat the two variances as being equal. If TRUE then the pooled variance is used to estimate the variance otherwise the Welch (or Satterthwaite) approximation to the degrees of freedom is used.

**bf.prior**

A number between 0.5 and 2 (default 0.707), the prior width to use in calculating Bayes factors and posterior estimates. In addition to numeric arguments, several named values are also recognized: "medium", "wide", and "ultrawide", corresponding to \( r \) scale values of 1/2, \( \sqrt{2}/2 \), and 1, respectively. In case of an ANOVA, this value corresponds to scale for fixed effects.

**tr**

Trim level for the mean when carrying out robust tests. In case of an error, try reducing the value of tr, which is by default set to 0.2. Lowering the value might help.

**nboot**

Number of bootstrap samples for computing confidence interval for the effect size (Default: \( 100L \)).

**top.text**

Text to display on top of the Bayes Factor message. This is mostly relevant in the context of ggtatsplot package functions.

... Additional arguments (currently ignored).

**Note**

To carry out Bayesian posterior estimation for ANOVA designs, you will need to install the development version of BayesFactor (0.9.12-4.3). You can download it by running: `remotes::install_github("richarddmorey/BayesFactor")`.

**Examples**

```r
# for reproducibility
set.seed(123)
library(statsExpressions)
options(tibble.width = Inf, pillar.bold = TRUE, pillar.neg = TRUE)
```
# ----------------------- parametric -------------------------------------

# between-subjects
oneway_anova(
  data = ggplot2::msleep,
  x = vore,
  y = sleep_rem
)

if (require("afex", quietly = TRUE)) {
  # within-subjects design
  oneway_anova(
    data = iris_long,
    x = condition,
    y = value,
    subject.id = id,
    paired = TRUE
  )
}

# ----------------------- non-parametric ----------------------------------

# between-subjects
oneway_anova(
  data = ggplot2::msleep,
  x = vore,
  y = sleep_rem,
  type = "np"
)

# within-subjects design
oneway_anova(
  data = iris_long,
  x = condition,
  y = value,
  subject.id = id,
  paired = TRUE,
  type = "np"
)

# ----------------------- robust -------------------------------------

# between-subjects
oneway_anova(
  data = ggplot2::msleep,
  x = vore,
  y = sleep_rem,
  type = "r"
)

# within-subjects design
oneway_anova(
data = iris_long,
x = condition,
y = value,
subject.id = id,
paired = TRUE,
type = "r"
)

# ----------------------- Bayesian -------------------------------------

# between-subjects
oneway_anova(
  data = ggplot2::msleep,
  x = vore,
  y = sleep_rem,
  type = "bayes"
)

# within-subjects design
# needs 'BayesFactor 0.9.12-4.3' or above
if (utils::packageVersion("BayesFactor") >= package_version("0.9.12-4.3")) {
  oneway_anova(
    data = iris_long,
    x = condition,
    y = value,
    subject.id = id,
    paired = TRUE,
    type = "bayes"
  )
}

---

one_sample_test  One-sample tests

Description

A dataframe containing results from a one-sample test.

Usage

one_sample_test(
  data,
  x,
  type = "parametric",
  test.value = 0,
  alternative = "two.sided",
  k = 2L,
  conf.level = 0.95,
one_sample_test

tr = 0.2,
bf.prior = 0.707,
effsize.type = "g",
top.text = NULL,
...
)

Arguments

data: A dataframe (or a tibble) from which variables specified are to be taken. Other
data types (e.g., matrix, table, array, etc.) will not be accepted.
x: A numeric variable from the dataframe data.
type: A character specifying the type of statistical approach:
  - "parametric"
  - "nonparametric"
  - "robust"
  - "bayes"

You can specify just the initial letter.
test.value: A number indicating the true value of the mean (Default: 0).
alternative: A character string specifying the alternative hypothesis, must be one of "two.sided"
  (default), "greater" or "less". You can specify just the initial letter.
k: Number of digits after decimal point (should be an integer) (Default: k = 2L).
conf.level: Scalar between 0 and 1. If unspecified, the defaults return 95% confidence/credible
  intervals (0.95).
tr: Trim level for the mean when carrying out robust tests. In case of an error,
  try reducing the value of tr, which is by default set to 0.2. Lowering the value
  might help.
bf.prior: A number between 0.5 and 2 (default 0.707), the prior width to use in calculat-
  ing Bayes factors and posterior estimates. In addition to numeric arguments,
  several named values are also recognized: "medium", "wide", and "ultrawide",
  corresponding to r scale values of 1/2, sqrt(2)/2, and 1, respectively. In case of
  an ANOVA, this value corresponds to scale for fixed effects.
effsize.type: Type of effect size needed for parametric tests. The argument can be "d" (for
  Cohen’s d) or "g" (for Hedge’s g).
top.text: Text to display on top of the Bayes Factor message. This is mostly relevant in
  the context of ggstatsplot package functions.
...

Details

The exact test and the effect size details contained will depend on the type argument.

Internal function .f used to carry out statistical test:

- **parametric**: stats::t.test
• **nonparametric**: stats::wilcox.test
• **robust**: WRS2::trimcibt
• **bayes**: BayesFactor::ttestBF

Internal function .f.es used to compute effect size:

• **parametric**: effectsize::cohens_d, effectsize::hedges_g
• **nonparametric**: effectsize::rank_biserial
• **robust**: WRS2::trimcibt
• **bayes**: bayestestR::describe_posterior

For more, see https://indrajeetpatil.github.io/statsExpressions/articles/stats_details.html

Examples

```r
# for reproducibility
set.seed(123)
library(statsExpressions)
options(tibble.width = Inf, pillar.bold = TRUE, pillar.neg = TRUE)

# ----------------------- parametric ---------------------------------------
one_sample_test(
  data = ggplot2::msleep,
  x = brainwt,
  test.value = 0.275,
  type = "parametric"
)

# ----------------------- non-parametric -----------------------------------
one_sample_test(
  data = ggplot2::msleep,
  x = brainwt,
  test.value = 0.275,
  type = "nonparametric"
)

# ----------------------- robust --------------------------------------------
one_sample_test(
  data = ggplot2::msleep,
  x = brainwt,
  test.value = 0.275,
  type = "robust"
)

# ---------------------------- Bayesian ------------------------------------
```

```r
```
Stats_type_switch

one_sample_test(
  data = ggplot2::msleep,
  x = brainwt,
  test.value = 0.275,
  type = "bayes",
  bf.prior = 0.8
)

Description

Relevant mostly for {ggstatsplot} and {statsExpressions} packages, where different statistical approaches are supported via this argument: parametric, non-parametric, robust, and Bayesian. This switch function converts strings entered by users to a common pattern for convenience.

Usage

stats_type_switch(type)

Arguments

type A character specifying the type of statistical approach:
  • "parametric"
  • "nonparametric"
  • "robust"
  • "bayes"

You can specify just the initial letter.

Examples

stats_type_switch("p")
stats_type_switch("bf")
Expressions with statistics for tidy regression dataframes

description

Expressions with statistics for tidy regression dataframes

Usage

tidy_model_expressions(
data, statistic = NULL, k = 2L, effsize.type = "omega", ...
)

Arguments

data A tidy dataframe from regression model object.
statistic Which statistic is to be displayed (either "t" or "f" or "z" or "chi") in the label.
k Number of digits after decimal point (should be an integer) (Default: k = 2L).
effsize.type Type of effect size needed for parametric tests. The argument can be "eta" (partial eta-squared) or "omega" (partial omega-squared).
... Currently ignored.

Note

This is an experimental function and may change in the future. Please do not use it yet in your workflow.

Examples

set.seed(123)

# tidy dataframe
df <- tidy_model_parameters(lm(wt ~ am * cyl, mtcars))

# create a column containing expressions
tidy_model_expressions(df, statistic = "t")
tidy_model_parameters  Convert parameters package output to tidyverse conventions

Description
Convert parameters package output to tidyverse conventions

Usage

```r
tidy_model_parameters(model, ...)
```

Arguments

- `model`  Statistical Model.
- `...`  Arguments passed to or from other methods. Non-documented arguments are digits, p_digits, ci_digits and footer_digits to set the number of digits for the output. group can also be passed to the print() method. See details in print.parameters_model() and 'Examples' in model_parameters.default().

Examples

```r
model <- lm(mpg ~ wt + cyl, data = mtcars)
tidy_model_parameters(model)
```

two_sample_test  Two-sample tests

Description
A dataframe containing results from a two-sample test and effect size plus confidence intervals.

To see details about functions which are internally used to carry out these analyses, see the following vignette- [https://indrajeetpatil.github.io/statsExpressions/articles/stats_details.html](https://indrajeetpatil.github.io/statsExpressions/articles/stats_details.html)

Usage

```r
two_sample_test(
  data,
  x,
  y,
  subject.id = NULL,
  type = "parametric",
  paired = FALSE,
  alternative = "two.sided",
  k = 2L,
)```
two_sample_test

conf.level = 0.95,
effsize.type = "g",
var.equal = FALSE,
bf.prior = 0.707,
tr = 0.2,
nboot = 100L,
top.text = NULL,
...
)

Arguments

data A dataframe (or a tibble) from which variables specified are to be taken. Other data types (e.g., matrix, table, array, etc.) will not be accepted.

x The grouping (or independent) variable from the dataframe data. In case of a repeated measures or within-subjects design, if subject.id argument is not available or not explicitly specified, the function assumes that the data has already been sorted by such an id by the user and creates an internal identifier. So if your data is not sorted, the results can be inaccurate when there are more than two levels in x and there are NAs present. The data is expected to be sorted by user in subject-1, subject-2, ..., pattern.

y The response (or outcome or dependent) variable from the dataframe data.

subject.id Relevant in case of a repeated measures or within-subjects design (paired = TRUE, i.e.), it specifies the subject or repeated measures identifier. Important: Note that if this argument is NULL (which is the default), the function assumes that the data has already been sorted by such an id by the user and creates an internal identifier. So if your data is not sorted and you leave this argument unspecified, the results can be inaccurate when there are more than two levels in x and there are NAs present.

type A character specifying the type of statistical approach:
  • "parametric"
  • "nonparametric"
  • "robust"
  • "bayes"

You can specify just the initial letter.

paired Logical that decides whether the experimental design is repeated measures/within-subjects or between-subjects. The default is FALSE.

alternative a character string specifying the alternative hypothesis, must be one of "two.sided" (default), "greater" or "less". You can specify just the initial letter.

k Number of digits after decimal point (should be an integer) (Default: k = 2L).

conf.level Scalar between 0 and 1. If unspecified, the defaults return 95% confidence/credible intervals (0.95).

effsize.type Type of effect size needed for parametric tests. The argument can be "d" (for Cohen's d) or "g" (for Hedge's g).
two_sample_test

var.equal  a logical variable indicating whether to treat the two variances as being equal. If TRUE then the pooled variance is used to estimate the variance otherwise the Welch (or Satterthwaite) approximation to the degrees of freedom is used.

bf.prior  A number between 0.5 and 2 (default 0.707), the prior width to use in calculating Bayes factors and posterior estimates. In addition to numeric arguments, several named values are also recognized: "medium", "wide", and "ultrawide", corresponding to $r$ scale values of 1/2, sqrt(2)/2, and 1, respectively. In case of an ANOVA, this value corresponds to scale for fixed effects.

tr  Trim level for the mean when carrying out robust tests. In case of an error, try reducing the value of tr, which is by default set to 0.2. Lowering the value might help.

nboot  Number of bootstrap samples for computing confidence interval for the effect size (Default: 100L).

top.text  Text to display on top of the Bayes Factor message. This is mostly relevant in the context of ggstatsplot package functions.

...  Currently ignored.
