Package 'sundialr'

January 12, 2019

Type Package

Title An Interface to 'SUNDIALS' Ordinary Differential Equation (ODE) Solvers

Version 0.1.2

Maintainer Satyaprakash Nayak <sn248@cornell.edu>

URL https://github.com/sn248/sundialr

BugReports https://github.com/sn248/sundialr/issues

Description Provides a way to call the functions in 'SUNDIALS' C ODE solving library (<https://computation.llnl.gov/projects/sundials>). Currently the serial version of ODE solver, 'CVODE' from the library can be accessed. The package requires ODE to be written as an 'R' or 'Rcpp' function and does not require the 'SUNDIALS' library to be installed on the local machine.

License GPL (>= 2)

LazyData TRUE

Imports Rcpp (>= 0.12.5)

LinkingTo Rcpp

RoxygenNote 6.1.1

Suggests knitr, rmarkdown

VignetteBuilder knitr

NeedsCompilation yes

cvode *cvode*

Description

CVODE solver to solve stiff ODEs

Usage

```
cvode(time_vector, IC, input_function, reltolerance, abstolerance)
```

Arguments

time_vector	time vector
IC	Initial Conditions
input_function	Right Hand Side function of ODEs
reltolerance	Relative Tolerance (a scalar)
abstolerance	Absolute Tolerance (a vector with length equal to ydot)

Examples

```
# ODEs described by an R function
ODE_R <- function(t, y){

  # vector containing the right hand side gradients
  ydot = vector(mode = "numeric", length = length(y))

  # R indices start from 1
  ydot[1] = -0.04 * y[1] + 10000 * y[2] * y[3]
  ydot[3] = 30000000 * y[2] * y[2]
  ydot[2] = -ydot[1] - ydot[3]

  ydot
```

```
}

# ODEs can also be described using Rcpp
Rcpp::sourceCpp(code = '

                #include <Rcpp.h>
                using namespace Rcpp;

                // ODE functions defined using Rcpp
                // [[Rcpp::export]]
                NumericVector ODE_Rcpp (double t, NumericVector y){

                // Initialize ydot filled with zeros
                NumericVector ydot(y.length());

                ydot[0] = -0.04 * y[0] + 10000 * y[1] * y[2];
                ydot[2] = 30000000 * y[1] * y[1];
                ydot[1] = -ydot[0] - ydot[2];

                return ydot;

                }')

# R code to genrate time vector, IC and solve the equations
time_vec <- c(0.0, 0.4, 4.0, 40.0, 4E2, 4E3, 4E4, 4E5, 4E6, 4E7, 4E8, 4E9, 4E10)
IC <- c(1,0,0)
reltol <- 1e-04
abstol <- c(1e-8,1e-14,1e-6)

## Solving the ODEs using cvode function
df1 <- cvode(time_vec, IC, ODE_R , reltol, abstol)           ## using R
df2 <- cvode(time_vec, IC, ODE_Rcpp , reltol, abstol)        ## using Rcpp

## Check that both solutions are identical
# identical(df1, df2)
```
