Package ‘units’
February 5, 2022

Version 0.8-0
Title Measurement Units for R Vectors
Depends R (>= 3.0.2)
Imports Rcpp
LinkingTo Rcpp (>= 0.12.10)
Suggests NISTunits, measurements, xml2, magrittr, pillar (>= 1.3.0),
  dplyr (>= 1.0.0), vctrs (>= 0.3.1), ggplot2 (>= 3.2.1), testthat
  (>= 3.0.0), vdiff, knitr, rmarkdown
VignetteBuilder knitr
Description Support for measurement units in R vectors, matrices
  and arrays: automatic propagation, conversion, derivation
  and simplification of units; raising errors in case of unit
  incompatibility. Compatible with the POSIXct, Date and difftime
  classes. Uses the UNIDATA udunits library and unit database for
  unit compatibility checking and conversion.
  Documentation about 'units' is provided in the paper by Pebesma, Mailund &
  Hiebert (2016, <doi:10.32614/RJ-2016-061>), included in this package as a
  vignette; see 'citation("units")' for details.

as_difftime

convert units object into difftime object

**Description**

convert units object into difftime object

**Usage**

```r
as_difftime(x)
```

**Arguments**

- `x` object of class `units`
Examples

t1 = Sys.time()
t2 = t1 + 3600
d = t2 - t1
du <- as_units(d)
dt = as_difftime(du)
class(dt)
dt

Description

boxplot for unit objects

Usage

## S3 method for class 'units'
boxplot(x, ..., horizontal = FALSE)

Arguments

x  object of class units, for which we want to plot the boxplot
...
parameters passed on to boxplot.default
horizontal  logical indicating if the boxplots should be horizontal; default FALSE means vertical boxes.

Examples

units_options(parse = FALSE) # otherwise we break on the funny symbol!
u = set_units(rnorm(100), degree_C)
boxplot(u)

deparse_unit  deparse unit to string in product power form (e.g. km m^-2 s^-1)

Description

deparse unit to string in product power form (e.g. km m^-2 s^-1)

Usage

deparse_unit(x)
Arguments

x object of class units

Value

length one character vector

Examples

u = as_units("kg m-2 s-1", implicit_exponents = TRUE)
u
deparse_unit(u)

drop_units

Description

Drop units attribute and class.

Usage

drop_units(x)

## S3 method for class 'units'
drop_units(x)

## S3 method for class 'data.frame'
drop_units(x)

## S3 method for class 'mixed_units'
drop_units(x)

Arguments

x an object with units metadata.

Details

Equivalent to units(x) <-NULL, or the pipe-friendly version set_units(x,NULL), but drop_units will fail if the object has no units metadata. Use the alternatives if you want this operation to succeed regardless of the object type.

A data.frame method is also provided, which checks every column and drops units if any.

Value

the numeric without any units attributes, while preserving other attributes like dimensions or other classes.
Examples

```r
x <- 1
y <- set_units(x, m/s)

# this succeeds
drop_units(y)
set_units(y, NULL)
set_units(x, NULL)

## Not run:
# this fails
drop_units(x)

## End(Not run)

df <- data.frame(x=x, y=y)
df
drop_units(df)
```

---

**hist.units**  
*histogram for unit objects*

**Description**

histogram for unit objects

**Usage**

```r
## S3 method for class 'units'
hist(x, xlab = NULL, main = paste("Histogram of", xname), ...)
```

**Arguments**

- **x**: object of class units, for which we want to plot the histogram
- **xlab**: character; x axis label
- **main**: character; title of histogram
- **...**: parameters passed on to `hist.default`

**Examples**

```r
units_options(parse = FALSE) # otherwise we break on the funny symbol!
u = set_units(rnorm(100), degree_C)
hist(u)
```
install_unit  

**Define or remove units**

**Description**

Installing new symbols and/or names allows them to be used in `as_units`, `make_units` and `set_units`. Optionally, a relationship can be defined between such symbols/names and existing ones (see details and examples).

**Usage**

```r
install_unit(symbol = character(0), def = character(0), name = character(0))
remove_unit(symbol = character(0), name = character(0))
```

**Arguments**

- `symbol` a vector of symbols to be installed/removed.
- `def` either
  - an empty definition, which defines a new base unit;
  - "unitless", which defines a new dimensionless unit;
  - a relationship with existing units (see details for the syntax).
- `name` a vector of names to be installed/removed.

**Details**

At least one symbol or name is expected, but multiple symbols and/or names can be installed (and thus mapped to the same unit) or removed at the same time. The `def` argument enables arbitrary relationships with existing units using UDUNITS-2 syntax:

<table>
<thead>
<tr>
<th>String Type</th>
<th>Using Names</th>
<th>Using Symbols</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td>Simple</td>
<td>meter</td>
<td>m</td>
<td></td>
</tr>
<tr>
<td>Raised</td>
<td>meter^2</td>
<td>m2</td>
<td>higher precedence than multiplying or dividing</td>
</tr>
<tr>
<td>Product</td>
<td>newton meter</td>
<td>N.m</td>
<td></td>
</tr>
<tr>
<td>Quotient</td>
<td>meter per second</td>
<td>m/s</td>
<td></td>
</tr>
<tr>
<td>Scaled</td>
<td>60 second</td>
<td>60 s</td>
<td></td>
</tr>
<tr>
<td>Prefixed</td>
<td>kilometer</td>
<td>km</td>
<td></td>
</tr>
<tr>
<td>Offset</td>
<td>kelvin from 273.15</td>
<td>K @ 273.15</td>
<td>lower precedence than multiplying or dividing</td>
</tr>
<tr>
<td>Logarithmic</td>
<td>lg(re milliwatt)</td>
<td>lg(re mW)</td>
<td>&quot;lg&quot; is base 10, &quot;ln&quot; is base e, and &quot;lb&quot; is base 2</td>
</tr>
<tr>
<td>Grouped</td>
<td>(5 meter)/(30 second)</td>
<td>(5 m)/(30 s)</td>
<td></td>
</tr>
</tbody>
</table>

The above may be combined, e.g., 

```
0.1 lg(re m/(5 s)^2) @ 50
```

You may also look at the `<def>` elements in the units database to see examples of string unit specifications.
Examples

# define a fortnight
install_unit("fn", "2 week", "fortnight")
year <- as_units("year")
set_units(year, fn)  # by symbol
set_units(year, fortnight)  # by name
# clean up
remove_unit("fn", "fortnight")

# working with currencies
install_unit("dollar")
install_unit("euro", "1.22 dollar")
install_unit("yen", "0.0079 euro")
set_units(as_units("dollar"), yen)
# clean up
remove_unit(c("dollar", "euro", "yen"))

# an example from microbiology
cfu_symbols <- c("CFU", "cfu")
cfu_names <- c("colony_forming_unit", "ColonyFormingUnit")
install_unit("cell")
install_unit(cfu_symbols, "3.4 cell", cfu_names)
cell <- set_units(2.5e5, cell)
vol <- set_units(500, ul)
set_units(cell/vol, "cfu/ml")
set_units(cell/vol, "CFU/ml")
set_units(cell/vol, "colony_forming_unit/ml")
set_units(cell/vol, "ColonyFormingUnit/ml")
# clean up
remove_unit(c("cell", cfu_symbols), cfu_names)

keep_units  Apply a function keeping units

Description

Helper function to apply a function to a units object and then restore the original units.

Usage

keep_units(FUN, x, ..., unit = units(x))

Arguments

FUN  the function to be applied.
x  first argument of FUN, of class units.
...  optional arguments to FUN.
unit  symbolic unit to restore after FUN.
Details

Provided for incompatible functions that do not preserve units. The user is responsible for ensuring the correctness of the output.

Value

An object of class units.

Examples

```r
x <- set_units(1:5, m)
keep_units(drop_units, x)
```

Description

Load an XML database containing a unit system compatible with UDUNITS2.

Usage

```r
load_units_xml(path = default_units_xml())
```

Arguments

path

A path to a valid system in XML format.

Details

A unit system comprises a root `<unit-system>` and a number of children defining prefixes `<prefix>` or units `<unit>`. See the contents of `system.file("share/udunits", package="units")` for examples.

Examples

```r
# load a new unit system
load_units_xml(system.file("share/udunits/udunits2-base.xml", package="units"))
## Not run:
set_units(1, rad) # doesn't work

## End(Not run)

# reload the default unit system
load_units_xml()
set_units(1, rad) # works again
```
Math.units

**Mathematical operations for units objects**

### Description

Mathematical operations for units objects

### Usage

```r
## S3 method for class 'units'
Math(x, ...)
```

### Arguments

- **x**: object of class units
- **...**: parameters passed on to the Math functions

### Details

Logarithms receive a special treatment by the underlying *udunits2* library. If a natural logarithm is applied to some unit, the result is \( \ln(\text{re 1 unit}) \), which means natural logarithm referenced to 1 unit. For base 2 and base 10 logarithms, the output \( \log_2(...) \) and \( \log_10(...) \) respectively instead of \( \ln(...) \).

This is particularly important for some units that are typically expressed in a logarithmic scale (i.e., bels, or, more commonly, decibels), such as Watts or Volts. For some of these units, the default *udunits2* database contains aliases: e.g., BW (bel-Watts) is an alias of \( \log(\text{re 1 W}) \); Bm (bel-milliWatts) is an alias of \( \log(\text{re 0.001 W}) \); BV is an alias of \( \log(\text{re 1 V}) \) (bel-Volts), and so on and so forth (see the output of `valid_udunits()` for further reference).

Additionally, the *units* package defines B, the bel, by default (because it is not defined by *udunits2*) as an alias of \( \log(\text{re 1}) \), unless a user-provided XML database already contains a definition of B, or the `define_bel` option is set to FALSE (see `help(units_options)`).

### Examples

```r
# roundings, cumulative functions
x <- set_units(sqrt(1:10), m/s)
signif(x, 2)
cumsum(x)

# trigonometry
sin(x) # not meaningful
x <- set_units(sqrt(1:10), rad)
sin(x)
cos(x)
x <- set_units(seq(0, 1, 0.1), 1)
asin(x)
acos(x)
```
# logarithms
x <- set_units(sqrt(1:10), W)
log(x) # base exp(1)
log(x, base = 3)
log2(x)
log10(x)
set_units(x, dBW) # decibel-watts
set_units(x, dBm) # decibel-milliwatts

mixed_units

Create or convert to a mixed units list-column

Description
Create or convert to a mixed units list-column

Usage
mixed_units(x, values, ...)

## S3 replacement method for class 'mixed_units'
units(x) <- value

Arguments
x numeric, or vector of class units
values character vector with units encodings, or list with symbolic units of class mixed_symbolic_units
... ignored
value see values

Details
if x is of class units, values should be missing or of class mixed_symbolic_units; if x is numeric, values should be a character vector the length of x.

Examples
a <- 1:4
u <- c("m/s", "km/h", "mg/L", "g")
mixed_units(a, u)
units(a) = as_units("m/s")
mixed_units(a) # converts to mixed representation
Ops.units

S3 Ops Group Generic Functions for units objects

Description
Ops functions for units objects, including comparison, product and divide, add, subtract.

Usage

## S3 method for class 'units'
Ops(e1, e2)

Arguments
e1  object of class units, or something that can be coerced to it by as_units(e1)
e2  object of class units, or something that can be coerced to it by as_units(e2),
or in case of power a number (integer n or 1/n)

Details
Users are advised against performing arithmetical operations with temperatures in different units. The units package ensure that results 1) are arithmetically correct, and 2) satisfy dimensional analysis, but could never ensure that results are physically meaningful. Temperature units are special because there is an absolute unit, Kelvin, and relative ones, Celsius and Fahrenheit degrees. Arithmetic operations between them are meaningless from the physical standpoint. Users are thus advised to convert all temperatures to Kelvin before operating.

Value
object of class units

Examples
a <- set_units(1:3, m/s)
b <- set_units(1:3, m/s)
a + b
a * b
a / b
a <- as_units("kg m-3")
b <- set_units(1, kg/m/m/m)
a + b
a = set_units(1:5, m)
a %/% a
a %/% set_units(2)
set_units(1:5, m^2) %/% set_units(2, m)
a %/% a
a %/% set_units(2)
Description

Create axis label with appropriate labels.
Plot method for units objects.

Usage

make_unit_label(lab, u, sep = units_options("sep"),
               group = units_options("group"), parse = units_options("parse"))

## S3 method for class 'units'
plot(x, y, xlab = NULL, ylab = NULL, ...)

Arguments

lab
length one character; name of the variable to plot
u
vector of class units
sep
length two character vector, defaulting to c("~", "~"), with the white space between unit name and unit symbols, and between subsequent symbols.
group
length two character vector with grouping symbols, e.g. c("(" , ")") for parenthesis, or c("","" ) for no group symbols
parse
logical; indicates whether a parseable expression should be returned (typically needed for super scripts), or a simple character string without special formatting.
x
object of class units, to plot along the x axis, or, if y is missing, along the y axis
y
object to plot along the y axis, or missing
xlab
character; x axis label
ylab
character; y axis label
...
other parameters, passed on to plot.default

Details

units_options can be used to set and change the defaults for sep, group and doParse.

Examples

displacement = mtcars$disp * as_units("in")^3
units(displacement) = make_units(cm^3)
weight = mtcars$wt * 1000 * make_units(lb)
units(weight) = make_units(kg)
plot(weight, displacement)

units_options(group = c("","" ) ) # parenthesis instead of square brackets
plot(weight, displacement)

units_options(sep = c("~~", "-"), group = c("", ""))  # no brackets; extra space
plot(weight, displacement)

units_options(sep = c("-", "--"), group = c("[", "]"))
gallon = as_units("gallon")
consumption = mtcars$mpg * make_units(mi/gallon)
units(consumption) = make_units(km/l)
plot(displacement, consumption)  # division in consumption

units_options(negative_power = TRUE)  # division becomes ^-1
plot(displacement, consumption)

plot(1/displacement, 1/consumption)

---

scale_units  

### Position scales for units data

#### Description

These are the default scales for the units class. These will usually be added automatically. To override manually, use `scale_*_units`.

#### Usage

```r
scale_x_units(..., position = "bottom", unit = NULL)
scale_y_units(..., unit = NULL)
```

#### Arguments

- `...`: arguments passed on to `continuous_scale`.
- `position`: For position scales, The position of the axis. left or right for y axes, top or bottom for x axes.
- `unit`: A unit specification to use for the axis. If given, the values will be converted to this unit before plotting. An error will be thrown if the specified unit is incompatible with the unit of the data.

#### Examples

```r
if (requireNamespace("ggplot2", quietly=TRUE)) {

library(ggplot2)

mtcars$consumption <- set_units(mtcars$mpg, mi / gallon)
mtcars$power <- set_units(mtcars$hp, hp)
```
seq.units

seq method for units objects

Description

seq method for units objects

Usage

## S3 method for class 'units'
seq(from, to, by = ((to - from)/(length.out - 1)),
length.out = NULL, along.with = NULL, ...)

Arguments

from see seq
to see seq
by see seq
length.out see seq
along.with see seq
... see seq

Details

arguments with units are converted to have units of the first argument (which is either from or to)

Examples

seq(to = set_units(10, m), by = set_units(1, m), length.out = 5)
seq(set_units(10, m), by = set_units(1, m), length.out = 5)
seq(set_units(10, m), set_units(19, m))
seq(set_units(10, m), set_units(.1, km), set_units(10000, mm))
ud_are_convertible

Test if two units are convertible

Description

Parses and checks whether units can be converted by UDUNITS-2. Units may not be convertible either because they are different magnitudes or because one (or both) units are not defined in the database.

Usage

ud_are_convertible(x, y)

Arguments

x character or object of class symbolic_units, for the symbol of the first unit.
y character or object of class symbolic_units, for the symbol of the second unit.

Value

boolean, TRUE if both units exist and are convertible.

Examples

ud_are_convertible("m", "km")
a <- set_units(1:3, m/s)
ud_are_convertible(units(a), "km/h")
ud_are_convertible("s", "kg")

unitless

The "unit" type for vectors that are actually dimension-less.

Description

The "unit" type for vectors that are actually dimension-less.

Usage

unitless

Format

An object of class symbolic_units of length 2.
Handle measurement units

Description

A number of functions are provided for handling unit objects.

- `units<-` and `units` are the basic functions to set and retrieve units.
- `as_units`, a generic with methods for a character string and for quoted language. Note, direct usage of this function by users is typically not necessary, as coercion via `as_units` is automatically done with `units<-` and `set_units`.
- `make_units`, constructs units from bare expressions. `make_units(m/s)` is equivalent to `as_units(quote(m/s))`.
- `set_units`, a pipe-friendly version of `units<-`. By default it operates with bare expressions, but this behavior can be disabled by specifying `mode = "standard"` or setting `units_options(set_units_mode = "standard")`. If value is missing or set to 1, the object becomes unitless.

Usage

```r
## S3 replacement method for class 'numeric'
units(x) <- value
## S3 replacement method for class 'units'
units(x) <- value
## S3 replacement method for class 'logical'
units(x) <- value
## S3 method for class 'units'
units(x)
## S3 method for class 'symbolic_units'
units(x)
set_units(x, value, ..., mode = units_options("set_units_mode"))
make_units(bare_expression, check_is_valid = TRUE)
as_units(x, ...)
## Default S3 method:
as_units(x, value = unitless, ...)
## S3 method for class 'units'
as_units(x, value, ...)
## S3 method for class 'symbolic_units'
```
as_units(x, value, ...)

## S3 method for class 'difftime'
as_units(x, value, ...)

## S3 method for class 'character'
as_units(x, check_is_valid = TRUE,
    implicit_exponents = NULL, force_single_symbol = FALSE, ...)

## S3 method for class 'call'
as_units(x, check_is_valid = TRUE, ...)

## S3 method for class 'expression'
as_units(x, check_is_valid = TRUE, ...)

## S3 method for class 'name'
as_units(x, check_is_valid = TRUE, ...)

## S3 method for class 'POSIXt'
as_units(x, value, ...)

## S3 method for class 'Date'
as_units(x, value, ...)

Arguments

x numeric vector, or object of class units.

value object of class units or symbolic_units, or in the case of set_units expres-
sion with symbols (see examples).

... passed on to other methods.

mode if "symbols" (the default), then unit is constructed from the expression supplied. Otherwise, if mode = "standard", standard evaluation is used for the supplied value. This argument can be set via a global option units_options(set_units_mode = "standard")

bare_expression a bare R expression describing units. Must be valid R syntax (reserved R syntax words like in must be backtickled)

check_is_valid throw an error if all the unit symbols are not either recognized by udunits2 via
    ud_is_parseable(), or a custom user defined via install_unit(). If FALSE, no check for validity is performed.

implicit_exponents If the unit string is in product power form (e.g. "km m^-2 s^-1"). Defaults to NULL, in which case a guess is made based on the supplied string. Set to TRUE or FALSE if the guess is incorrect.

force_single_symbol Whether to perform no string parsing and force treatment of the string as a single symbol.
Details

If `value` is of class `units` and has a value unequal to 1, this value is ignored unless `units_options("simplify")` is `TRUE`. If `simplify` is `TRUE`, `x` is multiplied by this value.

Value

An object of class `units`.

The `units` method retrieves the units attribute, which is of class `symbolic_units`.

Character strings

Generally speaking, there are 3 types of unit strings are accepted in `as_units` (and by extension, `units<-`).

The first, and likely most common, is a "standard" format unit specification where the relationship between unit symbols or names is specified explicitly with arithmetic symbols for division `/`, multiplication `*` and power exponents `^`, or other mathematical functions like `log()`. In this case, the string is parsed as an R expression via `parse(text = )` after backticking all unit symbols and names, and then passed on to `as_units.call()`. A heuristic is used to perform backticking, such that any continuous set of characters uninterrupted by one of `\(\)/\*^-` are backticked (unless the character sequence consists solely of numbers `0-9`), with some care to not double up on pre-existing backticks. This heuristic appears to be quite robust, and works for units would otherwise not be valid R syntax. For example, percent (`"%"`), feet (`"'"`), inches (`"in"`), and Tesla (`"T"`) are all backticked and parsed correctly.

Nevertheless, for certain complex unit expressions, this backticking heuristic may give incorrect results. If the string supplied fails to parse as an R expression, then the string is treated as a single symbolic unit and `symbolic_unit(chr)` is used as a fallback with a warning. In that case, automatic unit simplification may not work properly when performing operations on unit objects, but unit conversion and other Math operations should still give correct results so long as the unit string supplied returns `TRUE` for `ud_is_parsable()`.

The second type of unit string accepted is one with implicit exponents. In this format, `/`, `*`, and `^`, may not be present in the string, and unit symbol or names must be separated by a space. Each unit symbol may optionally be followed by a single number, specifying the power. For example "m^2 s^-2" is equivalent to "(m^2)*(s^-2)".

It must be noted that prepended numbers are supported too, but their interpretation slightly varies depending on whether they are separated from the unit string or not. E.g., "1000 m" is interpreted as magnitude and unit, but "1000m" is interpreted as a prefixed unit, and it is equivalent to "km" to all effects.

The third type of unit string format accepted is the special case of udunits time duration with a reference origin, for example "hours since 1970-01-01 00:00:00". Note, that the handling of time and calendar operations via the udunits library is subtly different from the way R handles date and time operations. This functionality is mostly exported for users that work with udunits time data, e.g., with NetCDF files. Users are otherwise encouraged to use R's date and time functionality provided by Date and POSIXt classes.
Expressions

In `as_units()`, each of the symbols in the unit expression is treated individually, such that each symbol must be recognized by the udunits database (checked by `ud_is_parseable()`, or be a custom, user-defined unit symbol that was defined by `install_unit()`). To see which symbols and names are currently recognized by the udunits database, see `valid_udunits()`.

Note

By default, unit names are automatically substituted with unit names (e.g., kilogram -> kg). To turn off this behavior, set `units_options(auto_convert_names_to_symbols = FALSE)`

install_unit, valid_udunits

Examples

```r
x = 1:3
class(x)
units(x) <- as_units("m/s")
class(x)
y = 2:5
a <- set_units(1:3, m/s)
units(a) <- make_units(km/h)
a
# convert to a mixed_units object:
units(a) = c("m/s", "km/h", "km/h")
a
# The easiest way to assign units to a numeric vector is like this:
x <- y <- 1:4
units(x) <- "m/s" # meters / second

# Alternatively, the easiest pipe-friendly way to set units:
if(requireNamespace("magrittr", quietly = TRUE)) {
  library(magrittr)
y %<>% set_units(m/s)
}

# these are different ways of creating the same unit:
# meters per second squared, i.e, acceleration
x1 <- make_units(m/s^2)
x2 <- as_units(quote(m/s^2))
x2 <- as_units("m/s^2")
x3 <- as_units("m s^-2") # in product power form, i.e., implicit exponents = T
x4 <- set_units(1, m/s^2) # by default, mode = "symbols"
x5 <- set_units(1, "m/s^2", mode = "standard")
x6 <- set_units(1, x1, mode = "standard")
x7 <- set_units(1, units(x1), mode = "standard")
x8 <- as_units("m") / as_units("s")^2

all_identical <- function(...) {
```
l <- list(...)  
for(i in seq_along(l)[-1])  
  if(!identical(l[[1]], l[[i]]))  
    return(FALSE)  
TRUE  
}
all_identical(x1, x2, x3, x4, x5, x6, x7, x8)

# Note, direct usage of these unit creation functions is typically not  
# necessary, since coercion is automatically done via as_units(). Again,  
# these are all equivalent ways to generate the same result.
x1 <- x2 <- x3 <- x4 <- x5 <- x6 <- x7 <- x8 <- 1:4  
units(x1) <- "m/s^2"  
units(x2) <- "m s^-2"  
units(x3) <- quote(m/s^2)  
units(x4) <- make_units(m/s^2)  
units(x5) <- as_units(quote(m/s^2))  
x6 <- set_units(x6, m/s^2)  
x7 <- set_units(x7, "m/s^2", mode = "standard")  
x8 <- set_units(x8, units(x1), mode = "standard")  

all_identical(x1, x2, x3, x4, x5, x6, x7, x8)

# Both unit names or symbols can be used. By default, unit names are  
# automatically converted to unit symbols.  
make_units(degree_C)  
make_units(kilogram)  
make_units(ohm)

## Arithmetic operations and units  
# conversion between unit objects that were defined as symbols and names will  
# work correctly, although unit simplification in printing may not always occur.  
x <- 500 * make_units(micrograms/liter)  
y <- set_units(200, ug/l)  
x + y  
x * y  
# numeric result is correct, but units not simplified completely

# note, plural form of unit name accepted too ('liters' vs 'liter'), and  
# denominator simplification can be performed correctly  
x * set_units(5, liters)  

# unit conversion works too  
set_units(x, grams/gallon)

## Creating custom, user defined units  
# For example, a microbiologist might work with counts of bacterial cells  
# make_units(cells/ml) # by default, throws an ERROR  
# First define the unit, then the newly defined unit is accepted.  
install_unit("cells")  
make_units(cells/ml)
# Note that install_unit() adds support for defining relationships between
# the newly created symbols or names and existing units.

## set_units()
# set_units is a pipe friendly version of `units<-`.
if(requireNamespace("magrittr", quietly = TRUE)) {
  library(magrittr)
  1:5 %>% set_units(N/m^2)
  # first sets to m, then converts to km
  1:5 %>% set_units(m) %>% set_units(km)
}

## set_units has two modes of operation. By default, it operates with
## bare symbols to define the units.
set_units(1:5, m/s)

# use `mode = "standard"` to use the value of supplied argument, rather than
# the bare symbols of the expression. In this mode, set_units() can be
# thought of as a simple alias for `units<-` that is pipe friendly.
set_units(1:5, "m/s", mode = "standard")
set_units(1:5, make_units(m/s), mode = "standard")

# the mode of set_units() can be controlled via a global option
# units_options(set_units_mode = "standard")

# To remove units use
units(x) <- NULL
# or
set_units(x, NULL)
# or
drop_units(y)
s = Sys.time()
d = s - (s+1)
as_units(d)

---

Defunct functions in units

### Description
These functions are no longer available.

### Details
- ud_units: Use as_units instead.
- as.units: Use as_units instead.
- make_unit: Use as_units instead.
- parse_unit: Use as_units instead.
• **as Cf**: Use `deparse_unit` instead.
• **install_symbolic_unit**: Use `install_unit` instead.
• **remove_symbolic_unit**: Use `remove_unit` instead.
• **install_conversion_constant**: Use `install_unit` instead.
• **install_conversion_offset**: Use `install_unit` instead.

---

**units_options**

*set one or more units global options*

---

**Description**

set units global options, mostly related how units are printed and plotted

**Usage**

```r
units_options(..., sep, group, negative_power, parse, set_units_mode,
    auto_convert_names_to_symbols, simplify, allow_mixed, unitless_symbol,
    define_bel)
```

**Arguments**

- **...**: named options (character) for which the value is queried
- **sep**: character length two; default c("-", "~"); space separator between variable and units, and space separator between two different units
- **group**: character length two; start and end group, may be two empty strings, a parenthesis pair, or square brackets; default: square brackets.
- **negative_power**: logical, default FALSE; should denominators have negative power, or follow a division symbol?
- **parse**: logical, default TRUE; should the units be made into an expression (so we get subscripts)? Setting to FALSE may be useful if `parse` fails, e.g. if the unit contains symbols that assume a particular encoding
- **set_units_mode**: character; either "symbols" or "standard"; see `set_units`; default is "symbols"
- **auto_convert_names_to_symbols**: logical, default TRUE: should names, such as `degree_C` be converted to their usual symbol?
- **simplify**: logical, default NA; simplify units in expressions?
- **allow_mixed**: logical; if TRUE, combining mixed units creates a `mixed_units` object, if FALSE it generates an error
- **unitless_symbol**: character; set the symbol to use for unitless (1) units
- **define_bel**: logical; if TRUE, define the unit B (i.e., the `bel`, widely used with the deci- prefix as dB, `decibel`) as an alias of `lg(re 1)`. TRUE by default, unless B is already defined in the existing XML database.
valid_udunits

Details

This sets or gets units options. Set them by using named arguments, get them by passing the option name.

The default NA value for simplify means units are not simplified in set_units or as_units, but are simplified in arithmetical expressions.

Value

in case options are set, invisibly a named list with the option values that are being set; if an option is queried, the current option value.

Examples

old = units_options(sep = c("~~~", "~"), group = c("", "")) # more space, parenthesis
old
## set back to defaults:
units_options(sep = c("-", "-"), group = c("[", "]"), negative_power = FALSE, parse = TRUE)
units_options("group")

valid_udunits  Get information about valid units

Description

These functions require the xml2 package, and return data frames with complete information about pre-defined units from UDUNITS2. Inspect this data frames to determine what inputs are accepted by as_units (and the other functions it powers: as_units, set_units, units<-).

Usage

valid_udunits(quiet = FALSE)

valid_udunits_prefixes(quiet = FALSE)

Arguments

quiet logical, defaults TRUE to give a message about the location of the udunits database being read.

Details

Any entry listed under symbol, symbol_aliases, name_singular, name_singular_aliases, name_plural, or name_plural_aliases is valid. Additionally, any entry under symbol or symbol_aliases may can also contain a valid prefix, as specified by valid_udunits_prefixes()

Note, this is primarily intended for interactive use, the exact format of the returned data frames may change in the future.
Value

A data frame with columns `symbol`, `symbol_aliases`, `name_singular`, `name_singular_aliases`, `name_plural`, or `name_plural_aliases`, `def`, `definition`, `comment`, `dimensionless` and `source_xml`.

Examples

```r
if (requireNamespace("xml2", quietly = TRUE)) {
  valid_udunits()
  valid_udunits_prefixes()
  if(interactive())
    View(valid_udunits())
}
```
