

Package ‘wrapr’

July 24, 2019

Type Package

Title Wrap R Tools for Debugging and Parametric Programming

Version 1.8.9

Date 2019-07-24

URL <https://github.com/WinVector/wrapr>,
<http://winvector.github.io/wrapr/>

Maintainer John Mount <jmount@win-vector.com>

BugReports <https://github.com/WinVector/wrapr/issues>

Description Tools for writing and debugging R code. Provides:

'%.>%' dot-pipe (an 'S3' configurable pipe),

'let()'

(converts non-standard evaluation interfaces to parametric standard evaluation interfaces, inspired by 'gtools:strmacro()' and 'base::bquote()'),

'build_frame()'/draw_frame()' ('data.frame' example tools),

'qc()' (quoting concatenate),

':= ' (named map builder),

and more.

License GPL-2 | GPL-3

Encoding UTF-8

LazyData true

RoxygenNote 6.1.1

Depends R (>= 3.2.1)

Imports utils, methods, graphics, stats

Suggests parallel, knitr, rmarkdown, RUnit, R.rsp

VignetteBuilder knitr, R.rsp

ByteCompile true

NeedsCompilation no

add_name_column *Add list name as a column to a list of data.frames.*

Description

Add list name as a column to a list of data.frames.

Usage

```
add_name_column(dlist, destinationColumn)
```

Arguments

dlist named list of data.frames
destinationColumn
 character, name of new column to add

Value

list of data frames, each of which as the new destinationColumn.

Examples

```
dlist <- list(a = data.frame(x = 1), b = data.frame(x = 2))
add_name_column(dlist, 'name')
```

ApplyTo

Apply a single argument function to its argument.

Description

If `x` is a `UnaryFn` instance this function returns a new `UnaryFnList` representing the composite function `c(f, x)` which is interpreted as the function `x(f(.))` (composition from left to right). Otherwise evaluate `f(x)` (application from left to right).

Usage

```
ApplyTo(f, x, env = parent.frame())

## S4 method for signature 'UnaryFnList,UnaryFnList'
ApplyTo(f, x, env = parent.frame())

## S4 method for signature 'UnaryFnList,UnaryFn'
ApplyTo(f, x, env = parent.frame())

## S4 method for signature 'UnaryFn,UnaryFnList'
ApplyTo(f, x, env = parent.frame())

## S4 method for signature 'UnaryFn,UnaryFn'
ApplyTo(f, x, env = parent.frame())

## S4 method for signature 'UnaryFnList,ANY'
ApplyTo(f, x, env = parent.frame())

## S4 method for signature 'PartialNamedFn,ANY'
ApplyTo(f, x, env = parent.frame())

## S4 method for signature 'PartialNamedFn,UnaryFnList'
ApplyTo(f, x,
  env = parent.frame())

## S4 method for signature 'PartialNamedFn,UnaryFn'
ApplyTo(f, x, env = parent.frame())

## S4 method for signature 'PartialFunction,ANY'
ApplyTo(f, x, env = parent.frame())

## S4 method for signature 'PartialFunction,UnaryFnList'
ApplyTo(f, x,
  env = parent.frame())

## S4 method for signature 'PartialFunction,UnaryFn'
ApplyTo(f, x, env = parent.frame())
```

```
## S4 method for signature 'SrcFunction,ANY'
ApplyTo(f, x, env = parent.frame())

## S4 method for signature 'SrcFunction,UnaryFnList'
ApplyTo(f, x, env = parent.frame())

## S4 method for signature 'SrcFunction,UnaryFn'
ApplyTo(f, x, env = parent.frame())
```

Arguments

| | |
|-----|--|
| f | object of S4 class derived from UnaryFn. |
| x | argument. |
| env | environment to work in. |

Value

f(x) if x is not a UnaryFn else f composed with x.

| | |
|------------|---|
| apply_left | <i>S3 dispatch on class of pipe_left_arg.</i> |
|------------|---|

Description

For formal documentation please see https://github.com/WinVector/wrapr/blob/master/extras/wrapr_pipe.pdf.

Usage

```
apply_left(pipe_left_arg, pipe_right_arg, pipe_environment, left_arg_name,
           pipe_string, right_arg_name)
```

Arguments

| | |
|------------------|---|
| pipe_left_arg | left argument. |
| pipe_right_arg | substitute(pipe_right_arg) argument. |
| pipe_environment | environment to evaluate in. |
| left_arg_name | name, if not NULL name of left argument. |
| pipe_string | character, name of pipe operator. |
| right_arg_name | name, if not NULL name of right argument. |

Value

result

See Also

`apply_left.default`

Examples

```
apply_left.character <- function(pipe_left_arg,
                                pipe_right_arg,
                                pipe_environment,
                                left_arg_name,
                                pipe_string,
                                right_arg_name) {
  if(is.language(pipe_right_arg)) {
    wrapr::apply_left_default(pipe_left_arg,
                              pipe_right_arg,
                              pipe_environment,
                              left_arg_name,
                              pipe_string,
                              right_arg_name)
  } else {
    paste(pipe_left_arg, pipe_right_arg)
  }
}
setMethod(
  wrapr::apply_right_S4,

```

`apply_left.default` *S3 dispatch on class of pipe_left_arg.*

Description

Place evaluation of left argument in `.` and then evaluate right argument.

Usage

```
## Default S3 method:  
apply_left(pipe_left_arg, pipe_right_arg,  
           pipe_environment, left_arg_name, pipe_string, right_arg_name)
```

Arguments

`pipe_left_arg`
left argument

`pipe_right_arg`
substitute(`pipe_right_arg`) argument

`pipe_environment`
environment to evaluate in

`left_arg_name`
name, if not NULL name of left argument.

`pipe_string` character, name of pipe operator.

`right_arg_name`
name, if not NULL name of right argument.

Value

result

See Also

`apply_left`

Examples

```
5 %.>% sin(.)
```

apply_left_default *S3 dispatch on class of pipe_left_arg.*

Description

Place evaluation of left argument in `.` and then evaluate right argument.

Usage

```
apply_left_default(pipe_left_arg, pipe_right_arg, pipe_environment,  
  left_arg_name, pipe_string, right_arg_name)
```

Arguments

`pipe_left_arg`
left argument

`pipe_right_arg`
substitute(`pipe_right_arg`) argument

`pipe_environment`
environment to evaluate in

`left_arg_name`
name, if not NULL name of left argument.

`pipe_string` character, name of pipe operator.

`right_arg_name`
name, if not NULL name of right argument.

Value

result

See Also

`apply_left`

Examples

```
5 %.>% sin(.)
```

apply_right *S3 dispatch on class of pipe_right_argument.*

Description

Triggered if right hand side of pipe stage was a name that does not resolve to a function. For formal documentation please see https://github.com/WinVector/wrapr/blob/master/extras/wrapr_pipe.pdf.

Usage

```
apply_right(pipe_left_arg, pipe_right_arg, pipe_environment, left_arg_name,
            pipe_string, right_arg_name)
```

Arguments

```
pipe_left_arg                    left argument
pipe_right_arg                  right argument
pipe_environment                environment to evaluate in
left_arg_name                   name, if not NULL name of left argument.
pipe_string                    character, name of pipe operator.
right_arg_name                  name, if not NULL name of right argument.
```

Value

result

See Also

apply_left, apply_right_S4

Examples

```
# simulate a function pointer
apply_right.list <- function(pipe_left_arg,
                             pipe_right_arg,
                             pipe_environment,
                             left_arg_name,
                             pipe_string,
                             right_arg_name) {
  pipe_right_arg$f(pipe_left_arg)
}
```

```
f <- list(f=sin)
2 %.>% f
f$f <- cos
2 %.>% f
```

```
apply_right.default
```

Default apply_right implementation.

Description

Default apply_right implementation: S4 dispatch to apply_right_S4.

Usage

```
## Default S3 method:
apply_right(pipe_left_arg, pipe_right_arg,
            pipe_environment, left_arg_name, pipe_string, right_arg_name)
```

Arguments

```
pipe_left_arg      left argument
pipe_right_arg     pipe_right_arg argument
pipe_environment   environment to evaluate in
left_arg_name      name, if not NULL name of left argument.
pipe_string        character, name of pipe operator.
right_arg_name     name, if not NULL name of right argument.
```

Value

result

See Also

apply_left, apply_right, apply_right_S4

Examples

```
# simulate a function pointer
apply_right.list <- function(pipe_left_arg,
                             pipe_right_arg,
                             pipe_environment,
                             left_arg_name,
                             pipe_string,
                             right_arg_name) {
  pipe_right_arg$f(pipe_left_arg)
}

f <- list(f=sin)
2 %.>% f
f$f <- cos
2 %.>% f
```

 apply_right_S4

S4 dispatch method for apply_right.

Description

Intended to be generic on first two arguments.

Usage

```
apply_right_S4(pipe_left_arg, pipe_right_arg, pipe_environment,
               left_arg_name, pipe_string, right_arg_name)
```

Arguments

```
pipe_left_arg      left argument
pipe_right_arg     pipe_right_arg argument
pipe_environment   environment to evaluate in
left_arg_name      name, if not NULL name of left argument.
pipe_string        character, name of pipe operator.
right_arg_name     name, if not NULL name of right argument.
```

Value

result

See Also

apply_left, apply_right

Examples

```
a <- data.frame(x = 1)
b <- data.frame(x = 2)

# a %.>% b # will (intentionally) throw

setMethod(
  "apply_right_S4",
  signature("data.frame", "data.frame"),
  function(pipe_left_arg,
           pipe_right_arg,
           pipe_environment,
           left_arg_name,
           pipe_string,
           right_arg_name) {
    rbind(pipe_left_arg, pipe_right_arg)
  })

a %.>% b # should equal data.frame(x = c(1, 2))
```

as.list.UnaryFn *Get list of primitive unary fns.*

Description

Get list of primitive unary fns.

Usage

```
## S3 method for class 'UnaryFn'
as.list(x, ...)
```

Arguments

x UnaryFn derived classe to extract
 ... not used.

Value

list of non UnaryFnList functions

Examples

```
as.list(pkgfn("base::sin", "x"))
as.list(c(pkgfn("base::sin", "x"), pkgfn("base::cos", "x")))
```

```
as.list.UnaryFnList
```

Get list of primitive unary fns.

Description

Get list of primitive unary fns.

Usage

```
## S3 method for class 'UnaryFnList'
as.list(x, ...)
```

Arguments

| | |
|-----|-----------------------------------|
| x | UnaryFn derived classe to extract |
| ... | not used. |

Value

list of non UnaryFnList functions

Examples

```
as.list(pkgfn("base::sin", "x"))
as.list(c(pkgfn("base::sin", "x"), pkgfn("base::cos", "x")))
```

```
as.UnaryFn
```

Convert a list of UnaryFns into a UnaryFn.

Description

Unary functions are evaluated in left to right or first to last order.

Usage

```
as.UnaryFn(items, env = parent.frame())
```

Arguments

items list of UnaryFn derived instances.
 env environment to work in.

Value

UnaryFnList

See Also

pkgfn, wrapfn, srcfn

Examples

```
f <- as.UnaryFn(list(pkgfn("base::sin", "x"), pkgfn("base::cos", "x")))
cat(format(f))
1:3 %.>% f
```

 as_dot_fn

Convert an unevaluted pipeline into a function.

Description

Convert an unevaluted pipeline into a function of "."

Usage

```
as_dot_fn(pipeline, env = parent.frame())
```

Arguments

pipeline a un-evaluated wrapr pipeline.
 env environment to work in.

Details

Note: writes "." into env.

Value

single function with signature (., env = parent.frame())

Examples

```
f <- as_dot_fn(sin(.) %.>% cos(.))
f(1:3)

g <- as_dot_fn(. %.>% sin(.) %.>% cos(.))
g(1:3)
```

as_fn

Convert a pipeable object into a function.

Description

Convert a pipeable object into a function of "."

Usage

```
as_fn(pipeable, env = parent.frame())
```

Arguments

| | |
|----------|----------------------------------|
| pipeable | a wrapr dot-pipe pipeable object |
| env | environment to work in. |

Details

Note: writes "." into env.

Value

single function with signature (., env = parent.frame())

Examples

```
p <- pkgfn("base::sin", "x")
f <- as_fn(p)
f(5)
```

`as_fnlist`*Wrap a list of UnaryFns as a UnaryFnList.*

Description

Unary functions are evaluated in left to right or first to last order.

Usage

```
as_fnlist(items, env = parent.frame())
```

Arguments

| | |
|--------------------|------------------------------------|
| <code>items</code> | list of UnaryFn derived instances. |
| <code>env</code> | environment to work in. |

Value

UnaryFnList

See Also

`pkgfn`, `wrapfn`, `srcfn`

Examples

```
f <- as_fnlist(list(pkgfn("base::sin", "x"), pkgfn("base::cos", "x")))
cat(format(f))
1:3 %.>% f
```

`bquote_call`*Treat ... call argument as bquoted-values.*

Description

`bquote_call` re-writes calls.

Usage

```
bquote_call(call, env = parent.frame())
```

Arguments

| | |
|-------------------|-------------------------------------|
| <code>call</code> | result of <code>match.call()</code> |
| <code>env</code> | environment to perform lookups in. |

Details

Note: eagerly evaluates argument and writes them into the function's executing environment.

Value

altered call

See Also

bquote_function, bquote_call_args

bquote_function *Adapt a function to use bquote on its arguments.*

Description

bquote_function is for adapting a function defined elsewhere for bquote-enabled argument substitution.

Usage

```
bquote_function(fn)
```

Arguments

fn function to adapt, must have non-empty formals().

Value

new function.

See Also

bquote_call_args

Examples

```
angle = 1:10
variable <- as.name("angle")
plotb <- bquote_function(graphics::plot)
plotb(x = .(variable), y = sin(. (variable)))
```

```
f1 <- function(x) { substitute(x) }
f2 <- bquote_function(f1)
```

```
arg <- as.name("USER_ARG")
f2(arg) # returns arg
f2(.(arg)) # returns USER_ARG
```

buildNameCallback *Build a custom writeback function that writes state into a user named variable.*

Description

Build a custom writeback function that writes state into a user named variable.

Usage

```
buildNameCallback(varName)
```

Arguments

varName character where to write captured state

Value

writeback function for use with functions such as DebugFnW

Examples

```
# user function
f <- function(i) { (1:10)[[i]] }
# capture last error in variable called "lastError"
writeBack <- buildNameCallback('lastError')
# wrap function with writeBack
df <- DebugFnW(writeBack, f)
# capture error (Note: tryCatch not needed for user code!)
tryCatch(
  df(12),
  error = function(e) { print(e) })
# examine error
str(lastError)
# redo call, perhaps debugging
tryCatch(
  do.call(lastError$fn_name, lastError$args),
  error = function(e) { print(e) })
```

 build_frame

Build a data.frame from the user's description.

Description

A convenient way to build a data.frame in legible transposed form. Position of first "|" (or other infix operator) determines number of columns (all other infix operators are aliases for "|"). Names are de-referenced.

Usage

```
build_frame(..., cf_eval_environment = parent.frame())
```

Arguments

... cell names, first infix operator denotes end of header row of column names.
 cf_eval_environment environment to evaluate names in.

Value

character data.frame

See Also

draw_frame, qchar_frame

Examples

```
tc_name <- "training"
x <- build_frame(
  "measure", tc_name, "validation" |
  "minus binary cross entropy", 5, -7 |
  "accuracy", 0.8, 0.6 )
print(x)
str(x)
cat(draw_frame(x))

build_frame(
  "x" |
  -1 |
  2 )
```

| | |
|-----------|-------------------------|
| c.UnaryFn | <i>Combine UnaryFns</i> |
|-----------|-------------------------|

Description

Combine UnaryFns

Usage

```
## S3 method for class 'UnaryFn'  
c(...)
```

Arguments

... UnaryFn derived classes to combine

Value

UnaryFn representing the sequence

Examples

```
c(pkgfn("base::sin", "x"), pkgfn("base::cos", "x"))
```

| | |
|-------------------------|--|
| checkColsFormUniqueKeys | <i>Check that a set of columns form unique keys.</i> |
|-------------------------|--|

Description

For local data.frame only.

Usage

```
checkColsFormUniqueKeys(data, keyColNames)
```

Arguments

data data.frame to work with.
keyColNames character array of column names to check.

Value

logical TRUE if the rows of data are unique addressable by the columns named in keyColNames.

Examples

```
d <- data.frame(key = c('a','a', 'b'), k2 = c(1 ,2, 2))
checkColsFormUniqueKeys(d, 'key') # should be FALSE
checkColsFormUniqueKeys(d, c('key', 'k2')) # should be TRUE
```

check_equiv_frames *Check two data.frames are equivalent after sorting columns and rows.*

Description

Confirm two dataframes are equivalent after reordering columns and rows.

Usage

```
check_equiv_frames(d1, d2)
```

Arguments

| | |
|----|--------------|
| d1 | data.frame 1 |
| d2 | data.frame 2 |

Value

logical TRUE if equivalent

clean_fit_glm *Fit a stats::glm without carrying back large structures.*

Description

Please see <http://www.win-vector.com/blog/2014/05/trimming-the-fat-from-glm-models-in-> for discussion.

Usage

```
clean_fit_glm(outcome, variables, data, ..., family, intercept = TRUE,
  outcome_target = NULL, outcome_comparator = "==", weights = NULL,
  env = baseenv())
```

Arguments

| | |
|--------------------|---|
| outcome | character, name of outcome column. |
| variables | character, names of variable columns. |
| data | data.frame, training data. |
| ... | not used, force later arguments to be used by name |
| family | passed to stats::glm() |
| intercept | logical, if TRUE allow an intercept term. |
| outcome_target | scalar, if not NULL write outcome==outcome_target in formula. |
| outcome_comparator | one of "=", "!=", ">=", "<=", ">", "<", only use of outcome_target is not NULL. |
| weights | passed to stats::glm() |
| env | environment to work in. |

Value

list(model=model, summary=summary)

Examples

```

mk_data_example <- function(k) {
  data.frame(
    x1 = rep(c("a", "a", "b", "b"), k),
    x2 = rep(c(0, 0, 0, 1), k),
    y = rep(1:4, k),
    yC = rep(c(FALSE, TRUE, TRUE, TRUE), k),
    stringsAsFactors = FALSE)
}

res_glm <- clean_fit_glm("yC", c("x1", "x2"),
  mk_data_example(1),
  family = binomial)
length(serialize(res_glm$model, NULL))

res_glm <- clean_fit_glm("yC", c("x1", "x2"),
  mk_data_example(10000),
  family = binomial)
length(serialize(res_glm$model, NULL))

predict(res_glm$model,
  newdata = mk_data_example(1),
  type = "response")

```

clean_fit_lm *Fit a stats::lm without carrying back large structures.*

Description

Please see <http://www.win-vector.com/blog/2014/05/trimming-the-fat-from-glm-models-in-> for discussion.

Usage

```
clean_fit_lm(outcome, variables, data, ..., intercept = TRUE,
             weights = NULL, env = baseenv())
```

Arguments

| | |
|-----------|--|
| outcome | character, name of outcome column. |
| variables | character, names of variable columns. |
| data | data.frame, training data. |
| ... | not used, force later arguments to be used by name |
| intercept | logical, if TRUE allow an intercept term. |
| weights | passed to stats::glm() |
| env | environment to work in. |

Value

list(model=model, summary=summary)

Examples

```
mk_data_example <- function(k) {
  data.frame(
    x1 = rep(c("a", "a", "b", "b"), k),
    x2 = rep(c(0, 0, 0, 1), k),
    y = rep(1:4, k),
    yC = rep(c(FALSE, TRUE, TRUE, TRUE), k),
    stringsAsFactors = FALSE)
}

res_lm <- clean_fit_lm("y", c("x1", "x2"),
                     mk_data_example(1))
length(serialize(res_lm$model, NULL))

res_lm <- clean_fit_lm("y", c("x1", "x2"),
                     mk_data_example(10000))
length(serialize(res_lm$model, NULL))
```

```
predict(res_lm$model,  
        newdata = mk_data_example(1))
```

coalesce *Coalesce values (NULL/NA on left replaced by values on the right).*

Description

This is a simple "try to take values on the left, but fall back to the right if they are not available" operator. It is inspired by SQL coalesce and the notation is designed to evoke the idea of testing and the C# ?? null coalescing operator. NA and NULL are treated roughly equally: both are replaced regardless of available replacement value (with some exceptions). The exceptions are: if the left hand side is a non-zero length vector we preserve the vector type of the left-hand side and do not assign any values that vectors can not hold (NULLs and complex structures) and do not replace with a right argument list.

Usage

```
coalesce(coalesce_left_arg, coalesce_right_arg)  
  
coalesce_left_arg %?? coalesce_right_arg
```

Arguments

```
coalesce_left_arg  
    vector or list.  
coalesce_right_arg  
    vector or list.
```

Details

This operator represents a compromise between the desire to replace length zero structures and NULL/NA values and the desire to preserve the first argument's structure (vector versus list). The order of operations has been chosen to be safe, convenient, and useful. Length zero lists are not treated as NULL (which is consistent with R in general). Note for non-vector operations on conditions we recommend looking into `isTRUE`, which solves some problems even faster than coalesce style operators.

When `length(coalesce_left_arg) <= 0` then return `coalesce_right_arg` if `length(coalesce_right_arg) > 0`, otherwise return `coalesce_left_arg`. When `length(coalesce_left_arg) > 0`: assume `coalesce_left_arg` is a list or vector and `coalesce_right_arg` is a list or vector that is either the same length as `coalesce_left_arg` or length 1. In this case replace NA/NULL elements of `coalesce_left_arg` with corresponding elements of `coalesce_right_arg` (re-cycling `coalesce_right_arg` when it is length 1).

Value

`coalesce_left_arg` with NA elements replaced.

Functions

- `???`: coalesce operator

Examples

```

c(NA, NA, NA) ??? 5           # returns c(5, 5, 5)
c(1, NA, NA) ??? list(5)     # returns c(1, 5, 5)
c(1, NA, NA) ??? list(list(5)) # returns c(1, NA, NA)
c(1, NA, NA) ??? c(NA, 20, NA) # returns c(1, 20, NA)
NULL ??? list()             # returns NULL
NULL ??? c(1, NA)          # returns c(1, NA)
list(1, NULL, NULL) ??? c(3, 4, NA) # returns list(1, 4, NA_real_)
list(1, NULL, NULL, NA, NA) ??? list(2, NULL, NA, NULL, NA) # returns list(1, NULL, NA, NULL, NA)
c(1, NA, NA) ??? list(1, 2, list(3)) # returns c(1, 2, NA)
c(1, NA) ??? list(1, NULL)          # returns c(1, NA)
c() ??? list(1, NA, NULL)           # returns list(1, NA, NULL)
c() ??? c(1, NA, 2)                 # returns c(1, NA, 2)

```

Collector

Build a collector that can capture all pipe stages to the right.

Description

Build a collector that can capture all pipe stages to the right, using `bquote()` - `()` escaping.

Usage

```
Collector()
```

Value

a Collector list-object.

Examples

```

phase <- 0.1
Collector() %>% sin(.) %>% cos(. + .(phase))

```

| | |
|---------|---|
| DebugFn | <i>Capture arguments of exception throwing function call for later debugging.</i> |
|---------|---|

Description

Run fn, save arguments on failure. Please see: `vignette("DebugFnW", package="wrapr")`.

Usage

```
DebugFn(saveDest, fn, ...)
```

Arguments

| | |
|----------|---|
| saveDest | where to write captured state (determined by type): NULL random temp file, character temp file, name <code>globalenv()</code> variable, and function triggers callback. |
| fn | function to call |
| ... | arguments for fn |

Value

`fn(...)` normally, but if `fn(...)` throws an exception save to `saveDest` RDS of list `r` such that `do.call(rfn,rargs)` repeats the call to `fn` with `args`.

See Also

`dump.frames`, `DebugFn`, `DebugFnW`, `DebugFnWE`, `DebugPrintFn`, `DebugFnE`, `DebugPrintFnE`

Examples

```
saveDest <- paste0(tempfile('debug'), '.RDS')
f <- function(i) { (1:10)[[i]] }
# correct run
DebugFn(saveDest, f, 5)
# now re-run
# capture error on incorrect run
tryCatch(
  DebugFn(saveDest, f, 12),
  error = function(e) { print(e) })
# examine details
situation <- readRDS(saveDest)
str(situation)
# fix and re-run
situation$args[[1]] <- 6
do.call(situation$fn_name, situation$args)
# clean up
file.remove(saveDest)
```

| | |
|----------|---|
| DebugFnE | <i>Capture arguments and environment of exception throwing function call for later debugging.</i> |
|----------|---|

Description

Run fn, save arguments, and environment on failure. Please see: `vignette("DebugFnW", package="wrapr")`.

Usage

```
DebugFnE(saveDest, fn, ...)
```

Arguments

| | |
|----------|---|
| saveDest | where to write captured state (determined by type): NULL random temp file, character temp file, name <code>globalenv()</code> variable, and function triggers callback. |
| fn | function to call |
| ... | arguments for fn |

Value

`fn(...)` normally, but if `fn(...)` throws an exception save to `saveDest` RDS of list `r` such that `do.call(rfn,rargs)` repeats the call to `fn` with `args`.

See Also

`dump.frames`, `DebugFn`, `DebugFnW`, `DebugFnWE`, `DebugPrintFn`, `DebugFnE`, `DebugPrintFnE`

Examples

```
saveDest <- paste0(tempfile('debug'),'RDS')
f <- function(i) { (1:10)[[i]] }
# correct run
DebugFnE(saveDest, f, 5)
# now re-run
# capture error on incorrect run
tryCatch(
  DebugFnE(saveDest, f, 12),
  error = function(e) { print(e) })
# examine details
situation <- readRDS(saveDest)
str(situation)
# fix and re-run
situation$args[[1]] <- 6
do.call(situation$fn, situation$args, envir=situation$env)
# clean up
file.remove(saveDest)
```

`DebugFnW`*Wrap a function for debugging.*

Description

Wrap fn, so it will save arguments on failure.

Usage

```
DebugFnW(saveDest, fn)
```

Arguments

| | |
|-----------------------|---|
| <code>saveDest</code> | where to write captured state (determined by type): NULL random temp file, character temp file, name <code>globalenv()</code> variable, and function triggers callback. |
| <code>fn</code> | function to call |

Value

wrapped function that saves state on error.

See Also

`dump.frames`, `DebugFn`, `DebugFnW`, `DebugFnWE`, `DebugPrintFn`, `DebugFnE`, `DebugPrintFnE`
Operator idea from: <https://gist.github.com/nassimhaddad/c9c327d10a91dcf9a3370d30dff8ac3d> .
Please see: `vignette("DebugFnW", package="wrapr")`.

Examples

```
saveDest <- paste0(tempfile('debug'), '.RDS')
f <- function(i) { (1:10)[[i]] }
df <- DebugFnW(saveDest, f)
# correct run
df(5)
# now re-run
# capture error on incorrect run
tryCatch(
  df(12),
  error = function(e) { print(e) })
# examine details
situation <- readRDS(saveDest)
str(situation)
# fix and re-run
situation$args[[1]] <- 6
do.call(situation$fn, situation$args)
# clean up
file.remove(saveDest)
```

```
f <- function(i) { (1:10)[[i]] }
curEnv <- environment()
writeBack <- function(sit) {
  assign('lastError', sit, envir=curEnv)
}
attr(writeBack, 'name') <- 'writeBack'
df <- DebugFnW(writeBack, f)
tryCatch(
  df(12),
  error = function(e) { print(e) })
str(lastError)
```

DebugFnWE

Wrap function to capture arguments and environment of exception throwing function call for later debugging.

Description

Wrap fn, so it will save arguments and environment on failure. Please see: `vignette("DebugFnW", package="wrapr")`

Usage

```
DebugFnWE(saveDest, fn, ...)
```

Arguments

| | |
|-----------------------|---|
| <code>saveDest</code> | where to write captured state (determined by type): NULL random temp file, character temp file, name <code>globalenv()</code> variable, and function triggers callback. |
| <code>fn</code> | function to call |
| <code>...</code> | arguments for fn |

Value

wrapped function that captures state on error.

See Also

`dump.frames`, `DebugFn`, `DebugFnW`, `DebugFnWE`, `DebugPrintFn`, `DebugFnE`, `DebugPrintFnE`

Idea from: <https://gist.github.com/nassimhaddad/c9c327d10a91dcf9a3370d30dff8ac3d>

Examples

```

saveDest <- paste0(tempfile('debug'), '.RDS')
f <- function(i) { (1:10)[[i]] }
df <- DebugFnWE(saveDest, f)
# correct run
df(5)
# now re-run
# capture error on incorrect run
tryCatch(
  df(12),
  error = function(e) { print(e) })
# examine details
situation <- readRDS(saveDest)
str(situation)
# fix and re-run
situation$args[[1]] <- 6
do.call(situation$fn, situation$args, envir=situation$env)
# clean up
file.remove(saveDest)

```

| | |
|--------------|---|
| DebugPrintFn | <i>Capture arguments of exception throwing function call for later debugging.</i> |
|--------------|---|

Description

Run `fn` and print result, save arguments on failure. Use on systems like `ggplot()` where some calculation is delayed until `print()`. Please see: `vignette("DebugFnW", package="wrappR")`.

Usage

```
DebugPrintFn(saveDest, fn, ...)
```

Arguments

| | |
|-----------------------|---|
| <code>saveDest</code> | where to write captured state (determined by type): NULL random temp file, character temp file, name <code>globalenv()</code> variable, and function triggers callback. |
| <code>fn</code> | function to call |
| <code>...</code> | arguments for <code>fn</code> |

Value

`fn(...)` normally, but if `fn(...)` throws an exception save to `saveDest` RDS of list `r` such that `do.call(rfn, rargs)` repeats the call to `fn` with `args`.

See Also

dump.frames, DebugFn, DebugFnW, DebugFnWE, DebugPrintFn, DebugFnE, DebugPrintFnE

Examples

```
saveDest <- paste0(tempfile('debug'), '.RDS')
f <- function(i) { (1:10)[[i]] }
# correct run
DebugPrintFn(saveDest, f, 5)
# now re-run
# capture error on incorrect run
tryCatch(
  DebugPrintFn(saveDest, f, 12),
  error = function(e) { print(e) })
# examine details
situation <- readRDS(saveDest)
str(situation)
# fix and re-run
situation$args[[1]] <- 6
do.call(situation$fn, situation$args)
# clean up
file.remove(saveDest)
```

| | |
|---------------|---|
| DebugPrintFnE | <i>Capture arguments and environment of exception throwing function call for later debugging.</i> |
|---------------|---|

Description

Run fn and print result, save arguments and environment on failure. Use on systems like ggplot() where some calculation is delayed until print(). Please see: `vignette("DebugFnW", package="wrapr")`.

Usage

```
DebugPrintFnE(saveDest, fn, ...)
```

Arguments

| | |
|----------|--|
| saveDest | where to write captured state (determined by type): NULL random temp file, character temp file, name globalenv() variable, and function triggers callback. |
| fn | function to call |
| ... | arguments for fn |

Value

fn(...) normally, but if fn(...) throws an exception save to saveDest RDS of list r such that do.call(r\$fn, r\$args) repeats the call to fn with args.

See Also

dump.frames, DebugFn, DebugFnW, DebugFnWE, DebugPrintFn, DebugFnE, DebugPrintFnE

Examples

```
saveDest <- paste0(tempfile('debug'), '.RDS')
f <- function(i) { (1:10)[[i]] }
# correct run
DebugPrintFnE(saveDest, f, 5)
# now re-run
# capture error on incorrect run
tryCatch(
  DebugPrintFnE(saveDest, f, 12),
  error = function(e) { print(e) })
# examine details
situation <- readRDS(saveDest)
str(situation)
# fix and re-run
situation$args[[1]] <- 6
do.call(situation$fn, situation$args, envir=situation$env)
# clean up
file.remove(saveDest)
```

defineLambda

Define lambda function building function.

Description

Use this to place a copy of the lambda-symbol function builder in your workspace.

Usage

```
defineLambda(envir = parent.frame(), name = NULL)
```

Arguments

envir environment to work in.
name character, name to assign to (defaults to Greek lambda).

See Also

lambda, makeFunction_se, named_map_builder

Examples

```
defineLambda()
# ls()
```

dot_arrow

Pipe operator ("dot arrow", "dot pipe" or "dot arrow pipe").

Description

Defined as roughly : `a %>.% b ~ { . <-a; b };` (with visible .-side effects).

Usage

```
pipe_left_arg %.>% pipe_right_arg
```

```
pipe_left_arg %>.% pipe_right_arg
```

```
pipe_left_arg %.% pipe_right_arg
```

Arguments

```
pipe_left_arg
```

left argument expression (substituted into .)

```
pipe_right_arg
```

right argument expression (presumably including .)

Details

The pipe operator has a couple of special cases. First: if the right hand side is a name, then we try to de-reference it and apply it as a function or surrogate function.

The pipe operator checks for and throws an exception for a number of "piped into nothing cases" such as `5 %.>% sin()`, many of these checks can be turned off by adding braces.

For some discussion, please see <http://www.win-vector.com/blog/2017/07/in-praise-of-syntactic>

For some more examples, please see the package README <https://github.com/WinVector/wrapr>. For formal documentation please see https://github.com/WinVector/wrapr/blob/master/extras/wrapr_pipe.pdf.

For a base-R step-debuggable pipe please try the **Bizarro Pipe** <http://www.win-vector.com/blog/2017/01/using-the-bizarro-pipe-to-debug-ma>

`%>.%` and `%.>%` are synonyms.

Value

```
eval({ . <- pipe_left_arg; pipe_right_arg });)
```

Functions

- `%.>%`: dot arrow
- `%>.`: alias for dot arrow
- `%.%`: alias for dot arrow

Examples

```
# both should be equal:
cos(exp(sin(4)))
4 %.>% sin(.) %.>% exp(.) %.>% cos(.)
```

draw_frame

Render a simple data.frame in build_frame format.

Description

Render a simple data.frame in build_frame format.

Usage

```
draw_frame(x, ..., time_format = "%Y-%m-%d %H:%M:%S",
           formatC_options = list(), adjust_for_auto_indent = 2)
```

Arguments

`x` data.frame (with atomic types).

`...` not used for values, forces later arguments to bind by name.

`time_format` character, format for "POSIXt" classes.

`formatC_options` named list, options for formatC()- used on numerics.

`adjust_for_auto_indent` integer additional after first row padding

Value

character

See Also

build_frame, qchar_frame

Examples

```
tc_name <- "training"
x <- build_frame(
  "measure" , tc_name, "validation", "idx" |
  "minus binary cross entropy", 5 , 7 , 1L |
  "accuracy" , 0.8 , 0.6 , 2L )
print(x)
cat(draw_frame(x))
```

draw_framec

Render a simple data.frame in qchar_frame format.

Description

Render a simple data.frame in qchar_frame format.

Usage

```
draw_framec(x, ..., unquote_cols = character(0),
  adjust_for_auto_indent = 2)
```

Arguments

`x` data.frame (with character types).

`...` not used for values, forces later arguments to bind by name.

`unquote_cols` character, columns to elide quotes from.

`adjust_for_auto_indent` integer additional after first row padding.

Value

character

See Also

build_frame, qchar_frame

Examples

```
controlTable <- wrapr::qchar_frame(
  "flower_part", "Length" , "Width" |
  "Petal" , Petal.Length , Petal.Width |
  "Sepal" , Sepal.Length , Sepal.Width )
cat(draw_framec(controlTable, unquote_cols = qc(Length, Width)))
```

| | |
|-------|-------------------------------------|
| evalb | <i>eval(bquote(expr)) shortcut.</i> |
|-------|-------------------------------------|

Description

eval(bquote(expr)) shortcut.

Usage

```
evalb(..., where = parent.frame())
```

Arguments

... expression to evaluate (one argument).
 where environment to work in.

Value

eval(bquote(expr))

Examples

```
angle = 1:10
variable <- as.name("angle")
evalb(plot(x = .(variable), y = sin.(variable)))
```

| | |
|------------------|---|
| execute_parallel | <i>Execute f in parallel partitioned by partition_column.</i> |
|------------------|---|

Description

Execute f in parallel partitioned by partition_column, see partition_tables for details.

Usage

```
execute_parallel(tables, f, partition_column, ..., cl = NULL,
  debug = FALSE, env = parent.frame())
```

Arguments

| | |
|------------------|---|
| tables | named map of tables to use. |
| f | function to apply to each tableset signature is function takes a single argument that is a named list of data.frames. |
| partition_column | character name of column to partition on |
| ... | force later arguments to bind by name. |
| cl | parallel cluster. |
| debug | logical if TRUE use lapply instead of parallel::clusterApplyLB. |
| env | environment to look for values in. |

Value

list of f evaluations.

See Also

partition_tables

Examples

```

if(requireNamespace("parallel", quietly = TRUE)) {
  cl <- parallel::makeCluster(2)

  d <- data.frame(x = 1:5, g = c(1, 1, 2, 2, 2))
  f <- function(dl) {
    d <- dl$d
    d$s <- sqrt(d$x)
    d
  }
  r <- execute_parallel(list(d = d), f,
                           partition_column = "g",
                           cl = cl) %>%
    do.call(rbind, .) %>%
    print(.)

  parallel::stopCluster(cl)
}

```

`fnlist`*Wrap a list of functions as a function.*

Description

Unary functions are evaluated in left to right or first to last order.

Usage

```
fnlist(...)
```

Arguments

... UnaryFn derived instances.

Value

UnaryFnList

See Also

`pkgfn`, `wrapfn`, `srcfn`

Examples

```
f <- fnlist(pkgfn("base::sin", "x"), pkgfn("base::cos", "x"))
cat(format(f))
1:3 %.>% f
```

`format.PartialFunction`*format step*

Description

format step

Usage

```
## S3 method for class 'PartialFunction'
format(x, ...)
```

Arguments

x object to format
 ... additional arguments (not used)

Value

character

format.PartialNamedFn
format step

Description

format step

Usage

```
## S3 method for class 'PartialNamedFn'
format(x, ...)
```

Arguments

x object to format
 ... additional arguments (not used)

Value

character

format.SrcFunction *format step*

Description

format step

Usage

```
## S3 method for class 'SrcFunction'
format(x, ...)
```

Arguments

x object to format
 ... additional arguments (not used)

Value

character

```
format.UnaryFnList format step
```

Description

format step

Usage

```
## S3 method for class 'UnaryFnList'
format(x, ...)
```

Arguments

| | |
|-----|---------------------------------|
| x | object to format |
| ... | additional arguments (not used) |

Value

character

```
grepdf Grep for column names from a data.frame
```

DescriptionGrep for column names from a `data.frame`**Usage**

```
grepdf(pattern, x, ..., ignore.case = FALSE, perl = FALSE,
        value = FALSE, fixed = FALSE, useBytes = FALSE, invert = FALSE)
```

Arguments

| | |
|-------------|--|
| pattern | passed to <code>grep</code> |
| x | <code>data.frame</code> to work with |
| ... | force later arguments to be passed by name |
| ignore.case | passed to <code>grep</code> |
| perl | passed to <code>grep</code> |
| value | passed to <code>grep</code> |
| fixed | passed to <code>grep</code> |
| useBytes | passed to <code>grep</code> |
| invert | passed to <code>grep</code> |

Value

column names of x matching grep condition.

See Also

grep, grepv

Examples

```
d <- data.frame(xa=1, yb=2)

# starts with
grepdf('^x', d)

# ends with
grepdf('b$', d)
```

grepv

Return a vector of matches.

Description

Return a vector of matches.

Usage

```
grepv(pattern, x, ..., ignore.case = FALSE, perl = FALSE,
       fixed = FALSE, useBytes = FALSE, invert = FALSE)
```

Arguments

| | |
|-------------|---|
| pattern | character scalar, pattern to match, passed to grep. |
| x | character vector to match to, passed to grep. |
| ... | not used, forced later arguments to bind by name. |
| ignore.case | logical, passed to grep. |
| perl | logical, passed to grep. |
| fixed | logical, passed to grep. |
| useBytes | logical, passed to grep. |
| invert | passed to grep. |

Value

vector of matching values.

See Also

grep, grepdf

Examples

```
grepv("x$", c("sox", "xor"))
```

| | |
|-----------------|----------------------------------|
| has_no_dup_rows | <i>Check for duplicate rows.</i> |
|-----------------|----------------------------------|

Description

Check a simple data.frame (no list or exotic rows) for duplicate rows.

Usage

```
has_no_dup_rows(data)
```

Arguments

| | |
|------|------------|
| data | data.frame |
|------|------------|

Value

TRUE if there are no duplicate rows, else FALSE.

| | |
|-------------|------------------------------|
| invert_perm | <i>Invert a permutation.</i> |
|-------------|------------------------------|

Description

For a permutation p build q such that $p[q] == q[p] == \text{seq_len}(\text{length}(p))$. Please see <http://www.win-vector.com/blog/2017/05/on-indexing-operators-and-composition/> and <http://www.win-vector.com/blog/2017/09/permutation-theory-in-action/>.

Usage

```
invert_perm(p)
```

Arguments

| | |
|-----|--|
| p | vector of length n containing each of $\text{seq_len}(n)$ exactly once. |
|-----|--|

Value

vector `q` such that `p[q] == q[p] == seq_len(length(p))`

Examples

```
p <- c(4, 5, 7, 8, 9, 6, 1, 3, 2, 10)
q <- invert_perm(p)
p[q]
all.equal(p[q], seq_len(length(p)))
q[p]
all.equal(q[p], seq_len(length(p)))
```

lambda

Build an anonymous function.

Description

Mostly just a place-holder so lambda-symbol form has somewhere safe to hang its help entry.

Usage

```
lambda(..., env = parent.frame())
```

Arguments

`...` formal parameters of function, unbound names, followed by function body (code/language).
`env` environment to work in

Value

user defined function.

See Also

`defineLambda`, `makeFunction_se`, `named_map_builder`

Examples

```
#lambda-syntax: lambda(arg [, arg]*, body [, env=env])
# also works with lambda character as function name
# print(intToUtf8(0x03BB))

# example: square numbers
sapply(1:4, lambda(x, x^2))

# example more than one argument
```

```
f <- lambda(x, y, x+y)
f(2,4)

# brace interface syntax
f <- x := { x^2 }
f(5)

# formula interface syntax: [~arg|arg(~arg)+] := { body }
f <- x~y := { x + 3 * y }
f(5, 47)
```

lapplym

Memoizing wrapper for lapply.

Description

Memoizing wrapper for lapply.

Usage

```
lapplym(X, FUN, ...)
```

Arguments

| | |
|-----|---------------------------------------|
| X | list or vector of inputs |
| FUN | function to apply |
| ... | additional arguments passed to lapply |

Value

list of results.

See Also

VectorizeM, vapplym, parLapplyLBM

Examples

```
fs <- function(x) { x <- x[[1]]; print(paste("see", x)); sin(x) }
# should only print "see" twice, not 6 times
lapplym(c(0, 1, 1, 0, 0, 1), fs)
```

let *Execute expr with name substitutions specified in alias.*

Description

let implements a mapping from desired names (names used directly in the expr code) to names used in the data. Mnemonic: "expr code symbols are on the left, external data and function argument names are on the right."

Usage

```
let(alias, expr, ..., envir = parent.frame(), subsMethod = "langsubs",
    strict = TRUE, eval = TRUE, debugPrint = FALSE)
```

Arguments

| | |
|------------|--|
| alias | mapping from free names in expr to target names to use (mapping have both unique names and unique values). |
| expr | block to prepare for execution. |
| ... | force later arguments to be bound by name. |
| envir | environment to work in. |
| subsMethod | character substitution method, one of 'langsubs' (preferred), 'subsubs', or 'stringsubs'. |
| strict | logical if TRUE names and values must be valid un-quoted names, and not dot. |
| eval | logical if TRUE execute the re-mapped expression (else return it). |
| debugPrint | logical if TRUE print debugging information when in stringsubs mode. |

Details

Please see the `wrapr` vignette for some discussion of `let` and crossing function call boundaries: `vignette('wrapr', 'wrapr')`. For formal documentation please see https://github.com/WinVector/wrapr/blob/master/extras/wrapr_let.pdf. Transformation is performed by substitution, so please be wary of unintended name collisions or aliasing.

Something like `let` is only useful to get control of a function that is parameterized (in the sense it take column names) but non-standard (in that it takes column names from non-standard evaluation argument name capture, and not as simple variables or parameters). So `wrapr:let` is not useful for non-parameterized functions (functions that work only over values such as `base::sum`), and not useful for functions take parameters in straightforward way (such as `base::merge`'s "by" argument). `dplyr::mutate` is an example where we can use a `let` helper. `dplyr::mutate` is parameterized (in the sense it can work over user supplied columns and expressions), but column names are captured through non-standard evaluation (and it rapidly becomes unwieldy to use complex formulas with the standard evaluation equivalent `dplyr::mutate_`). `alias` can not include the symbol `"."`.

The intent from is from the user perspective to have (if `a <-1`; `b <-2`): `let(c(z = 'a'), z+b)` to behave a lot like `eval(substitute(z+b, c(z=quote(a))))`.

let deliberately checks that it is mapping only to legal R names; this is to discourage the use of let to make names to arbitrary values, as that is the more properly left to R's environment systems. let is intended to transform "tame" variable and column names to "tame" variable and column names. Substitution outcomes that are not valid simple R variable names (produced with out use of back-ticks) are forbidden. It is suggested that substitution targets be written ALL_CAPS style to make them stand out.

let was inspired by `gtools::strmacro()`. Please see <https://github.com/WinVector/wrapr/blob/master/extras/MacrosInR.md> for a discussion of macro tools in R.

Value

result of expr executed in calling environment (or expression if `eval==FALSE`).

See Also

`bquote`, `do.call`

Examples

```
d <- data.frame(
  Sepal_Length=c(5.8,5.7),
  Sepal_Width=c(4.0,4.4),
  Species='setosa')

mapping <- qc(
  AREA_COL = Sepal_area,
  LENGTH_COL = Sepal_Length,
  WIDTH_COL = Sepal_Width
)

# let-block notation
let(
  mapping,
  d %>%
    transform(., AREA_COL = LENGTH_COL * WIDTH_COL)
)

# Note: in packages can make assignment such as:
#   AREA_COL <- LENGTH_COL <- WIDTH_COL <- NULL
# prior to code so targets don't look like unbound names.
```

Description

Developed from: <http://www.win-vector.com/blog/2016/12/the-case-for-using-in-r/comment-page-1/#comment-66399>, <https://github.com/klmr/functional#a-concise-lambda-notation>, <https://github.com/klmr/functional/blob/master/lambda.r> Called from := operator.

Usage

```
makeFunction_se(params, body, env = parent.frame())
```

Arguments

| | |
|--------|---|
| params | formal parameters of function, unbound names. |
| body | substituted body of function to map arguments into (braces required for "!=" notation). |
| env | environment to work in. |

Value

user defined function.

See Also

`lambda`, `defineLambda`, `named_map_builder`

Examples

```
f <- makeFunction_se(as.name('x'), substitute({x*x}))
f(7)

f <- x := { x*x }
f(7)

g <- makeFunction_se(c(as.name('x'), as.name('y')), substitute({ x + 3*y }))
g(1,100)

g <- c(x,y) := { x + 3*y }
g(1,100)
```

| | |
|---------|---|
| mapsyms | <i>Map symbol names to referenced values if those values are string scalars (else throw).</i> |
|---------|---|

Description

Map symbol names to referenced values if those values are string scalars (else throw).

Usage

```
mapsyms(...)
```

Arguments

... symbol names mapping to string scalars

Value

map from original symbol names to new names (names found in the current environment)

See Also

let

Examples

```
x <- 'a'
y <- 'b'
print(mapsyms(x, y))
d <- data.frame(a = 1, b = 2)
let(mapsyms(x, y), d$x + d$y)
```

| | |
|-------------|----------------------|
| map_to_char | <i>format a map.</i> |
|-------------|----------------------|

Description

format a map.

Usage

```
map_to_char(mp, ..., sep = " ", assignment = "=",
  quote_fn = base::shQuote)
```

Arguments

| | |
|------------|--|
| mp | named vector or list |
| ... | not used, force later arguments to bind by name. |
| sep | separator suffix, what to put after commas |
| assignment | assignment string |
| quote_fn | string quoting function |

Value

character formatted representation

See Also

dput, capture.output

Examples

```
cat(map_to_char(c('a' = 'b', 'c' = 'd')))
cat(map_to_char(c('a' = 'b', 'd', 'e' = 'f')))
cat(map_to_char(c('a' = 'b', 'd' = NA, 'e' = 'f')))
cat(map_to_char(c(1, NA, 2)))
```

| | |
|-----------|--|
| map_upper | <i>Map up-cased symbol names to referenced values if those values are string scalars (else throw).</i> |
|-----------|--|

Description

Map up-cased symbol names to referenced values if those values are string scalars (else throw).

Usage

```
map_upper(...)
```

Arguments

... symbol names mapping to string scalars

Value

map from original symbol names to new names (names found in the current environment)

See Also

let

Examples

```
x <- 'a'
print(map_upper(x))
d <- data.frame(a = "a_val")
let(map_upper(x), paste(d$X, x))
```

| | |
|-------------|------------------------------------|
| match_order | <i>Match one order to another.</i> |
|-------------|------------------------------------|

Description

Build a permutation p such that $ids1[p] == ids2$. See <http://www.win-vector.com/blog/2017/09/permutation-theory-in-action/>.

Usage

```
match_order(ids1, ids2)
```

Arguments

| | |
|------|--|
| ids1 | unique vector of ids. |
| ids2 | unique vector of ids with $sort(ids1) == sort(ids2)$. |

Value

p integers such that $ids1[p] == ids2$

Examples

```
ids1 <- c(4, 5, 7, 8, 9, 6, 1, 3, 2, 10)
ids2 <- c(3, 6, 4, 8, 5, 7, 1, 9, 10, 2)
p <- match_order(ids1, ids2)
ids1[p]
all.equal(ids1[p], ids2)
# note base::match(ids2, ids1) also solves this problem
```

mk_formula

*Construct a formula.***Description**

Safely construct a simple Wilkinson notation formula from the outcome (dependent variable) name and vector of input (independent variable) names.

Usage

```
mk_formula(outcome, variables, ..., intercept = TRUE,
           outcome_target = NULL, outcome_comparator = "==", env = baseenv(),
           extra_values = NULL)
```

Arguments

| | |
|--------------------|--|
| outcome | character scalar, name of outcome or dependent variable. |
| variables | character vector, names of input or independent variables. |
| ... | not used, force later arguments to bind by name. |
| intercept | logical, if TRUE allow an intercept term. |
| outcome_target | scalar, if not NULL write outcome==outcome_target in formula. |
| outcome_comparator | one of "==", "!=", ">=", "<=", ">", "<", only use of outcome_target is not NULL. |
| env | environment to use in formula (unless extra_values is non empty, then this is a parent environemnt). |
| extra_values | if not empty extra values to be added to a new formula environment containing env. |

Details

Note: outcome and variables are each intended to be simple variable names or column names (or .). They are not intended to specify interactions, I()-terms, transforms, general expressions or other complex formula terms. Essentially the same effect as reformulate, but trying to avoid the paste currently in reformulate by calling update.formula (which appears to work over terms). Another reasonable way to do this is just paste(outcome, paste(variables, collapse = " + "), sep = " ~ ").

Care must be taken with later arguments to functions like lm() whose help states: "All of weights, subset and offset are evaluated in the same way as variables in formula, that is first in data and then in the environment of formula." Also note env defaults to baseenv() to try and minimize reference leaks produced by the environemnt captured by the formal ending up stored in the resulting model for lm() and glm(). For behavior closer to as.formula() please set the env argument to parent.frame().

Value

a formula object

See Also

reformulate, update.formula

Examples

```
f <- mk_formula("mpg", c("cyl", "disp"))
print(f)
(model <- lm(f, mtcars))
format(model$terms)

f <- mk_formula("cyl", c("wt", "gear"), outcome_target = 8, outcome_comparator = ">=")
print(f)
(model <- glm(f, mtcars, family = binomial))
format(model$terms)
```

mk_tmp_name_source *Produce a temp name generator with a given prefix.*

Description

Returns a function `f` where: `f()` returns a new temporary name, `f(remove=vector)` removes names in vector and returns what was removed, `f(dumpList=TRUE)` returns the list of names generated and clears the list, `f(peek=TRUE)` returns the list without altering anything.

Usage

```
mk_tmp_name_source(prefix = "tmpnam", ...,
  alphabet = as.character(0:9), size = 20, sep = "_")
```

Arguments

| | |
|-----------------------|--|
| <code>prefix</code> | character, string to prefix temp names with. |
| <code>...</code> | force later argument to be bound by name. |
| <code>alphabet</code> | character, characters to choose from in building ids. |
| <code>size</code> | character, number of characters to build id portion of names from. |
| <code>sep</code> | character, separator between temp name fields. |

Value

name generator function.

Examples

```
f <- mk_tmp_name_source('ex')
print(f())
nm2 <- f()
print(nm2)
f(remove=nm2)
print(f(dumpList=TRUE))
```

named_map_builder *Named map builder.*

Description

Set names of right-argument to be left-argument, and return right argument. Called from := operator.

Usage

```
named_map_builder(names, values)

" := " (names, values)

names % := % values
```

Arguments

| | |
|--------|---|
| names | names to set. |
| values | values to assign names to (and return). |

Value

values with names set.

See Also

lambda, defineLambda, makeFunction_se

Examples

```
c('a' := '4', 'b' := '5')
# equivalent to: c(a = '4', b = '5')

c('a', 'b') := c('1', '2')
# equivalent to: c(a = '1', b = '2')
```

```

# the important example
name <- 'a'
name := '5'
# equivalent to: c('a' = '5')

# fn version:
# applied when right side is {}
# or when left side is of class formula.

g <- x~y := { x + 3*y }
g(1,100)

f <- ~x := x^2
f(7)

f <- x := { sqrt(x) }
f(7)

```

orderv

Order by a list of vectors.

Description

Produce an ordering permutation from a list of vectors. Essentially a non-... interface to `order`.

Usage

```
orderv(columns, ..., na.last = TRUE, decreasing = FALSE,
        method = c("auto", "shell", "radix"))
```

Arguments

| | |
|-------------------------|---|
| <code>columns</code> | list of atomic columns to order on, can be a <code>data.frame</code> . |
| <code>...</code> | not used, force later arguments to bind by name. |
| <code>na.last</code> | (passed to <code>order</code>) for controlling the treatment of NAs. If <code>TRUE</code> , missing values in the data are put last; if <code>FALSE</code> , they are put first; if <code>NA</code> , they are removed. |
| <code>decreasing</code> | (passed to <code>order</code>) logical. Should the sort order be increasing or decreasing? For the "radix" method, this can be a vector of length equal to the number of arguments in ... For the other methods, it must be length one. |
| <code>method</code> | (passed to <code>order</code>) the method to be used: partial matches are allowed. The default ("auto") implies "radix" for short numeric vectors, integer vectors, logical vectors and factors. Otherwise, it implies "shell". For details of methods "shell", "quick", and "radix", see the help for <code>sort</code> . |

Value

ordering permutation

See Also

order, sortv

Examples

```
d <- data.frame(x = c(2, 2, 3, 3, 1, 1), y = 6:1)
d[order(d$x, d$y), , drop = FALSE]
d[orderv(d), , drop = FALSE]
```

parLapplyLBm

Memoizing wrapper for parLapplyLB

Description

Memoizing wrapper for parLapplyLB

Usage

```
parLapplyLBm(cl = NULL, X, fun, ..., chunk.size = NULL)
```

Arguments

| | |
|------------|---------------------------------------|
| cl | cluster object |
| X | list or vector of inputs |
| fun | function to apply |
| ... | additional arguments passed to lapply |
| chunk.size | passed to parallel::parLapplyLB |

Value

list of results.

See Also

parLapplyLB, lapplym, VectorizeM, vapplym

Examples

```

if(requireNamespace("parallel", quietly = TRUE)) {
  cl <- parallel::makeCluster(2)
  fs <- function(x) { x <- x[[1]]; Sys.sleep(1); sin(x) }
  # without memoization should take 1000 seconds
  lst <- parLapplyLBm(cl, c(rep(0, 1000), rep(1, 1000)), fs)
  parallel::stopCluster(cl)
}

```

PartialFunction-class

Function with partial arguments as a new single argument function.

Description

Function with partial arguments as a new single argument function.

PartialNamedFn-class

Package qualified name of a function as a function.

Description

Package qualified name of a function as a function.

partition_tables *Partition as set of tables into a list.*

Description

Partition a set of tables into a list of sets of tables. Note: removes rownames.

Usage

```

partition_tables(tables_used, partition_column, ..., source_usage = NULL,
  source_limit = NULL, tables = NULL, env = NULL)

```

Arguments

`tables_used` character, names of tables to look for.
`partition_column` character, name of column to partition by (tables should not have NAs in this column).
`...` force later arguments to bind by name.
`source_usage` optional named map from `tables_used` names to sets of columns used.
`source_limit` optional numeric scalar limit on rows wanted every source.
`tables` named map from `tables_used` names to `data.frames`.
`env` environment to also look for tables named by `tables_used`

Value

list of names maps of `data.frames` partitioned by `partition_column`.

See Also

`execute_parallel`

Examples

```

d1 <- data.frame(a = 1:5, g = c(1, 1, 2, 2, 2))
d2 <- data.frame(x = 1:3, g = 1:3)
d3 <- data.frame(y = 1)
partition_tables(c("d1", "d2", "d3"), "g", tables = list(d1 = d1, d2 = d2, d3 = d3))

```

`pkgfn`

Wrap the name of a function as a function.

Description

Wrap the name of a function as a function.

Usage

```
pkgfn(fname, arg_name = ".", args = list())
```

Arguments

`fname` character, function name in `fname` or `package::fname` format.
`arg_name` character, name of argument to assign.
`args` named list of additional arguments and values.

Value

PartialNamedFn

See Also

fnlist, wrapfn, srcfn

Examples

```
f <- pkgfn("base::sin", "x")
cat(format(f))
1:3 %.>% f
```

psagg

Pseudo aggregator.

Description

Take a vector or list and return the first element (pseudo-aggregation or projection). If the argument length is zero or there are different items throw in an error.

Usage

```
psagg(x, ..., strict = TRUE)
```

Arguments

| | |
|--------|--|
| x | should be a vector or list of items. |
| ... | force later arguments to be passed by name |
| strict | logical, should we check value uniqueness. |

Details

This function is useful in some split by column situations as a safe and legible way to convert vectors to scalars.

Value

x[[1]] (or throw if not all items are equal or this is an empty vector).

Examples

```
d <- data.frame(
  group = c("a", "a", "b"),
  stringsAsFactors = FALSE)
dl <- lapply(
  split(d, d$group),
  function(di) {
    data.frame(
      # note: di$group is a possibly length>1 vector!
      # pseudo aggregate it to the value that is
      # constant for each group, confirming it is constant.
      group_label = psagg(di$group),
      group_count = nrow(di),
      stringsAsFactors = FALSE
    )
  })
do.call(rbind, dl)
```

qae

Quote assignment expressions (name = expr, name := expr, name %:= % expr).

Description

Accepts arbitrary un-parsed expressions as assignments to allow forms such as "Sepal_Long := Sepal.Length >= 2 * Sepal.Width". (without the quotes). Terms are expressions of the form "lhs := rhs", "lhs = rhs", "lhs %:= % rhs".

Usage

```
qae(...)
```

Arguments

... assignment expressions.

Details

qae() uses bquote() .() quasiquotation escaping notation.

Value

array of quoted assignment expressions.

See Also

qc, qe

Examples

```

ratio <- 2

exprs <- qae(Sepal_Long := Sepal.Length >= ratio * Sepal.Width,
             Petal_Short = Petal.Length <= 3.5)
print(exprs)

exprs <- qae(Sepal_Long := Sepal.Length >= .(ratio) * Sepal.Width,
             Petal_Short = Petal.Length <= 3.5)
print(exprs)

# library("rqdatatable")
# datasets::iris %.>%
# extend_se(., exprs) %.>%
# summary(.)

```

qc

Quoting version of c() array concatenate.

Description

The `qc()` function is intended to help quote user inputs.

Usage

```
qc(..., .wrapr_private_var_env = parent.frame())
```

Arguments

```

...           items to place into an array
.wrapr_private_var_env
              environment to evaluate in

```

Details

`qc()` a convenience function allowing the user to elide excess quotation marks. It quotes its arguments instead of evaluating them, except in the case of a nested call to `qc()` or `c()`. Please see the examples for typical uses both for named and un-named character vectors.

`qc()` uses `bquote()` `.`() quasiquotation escaping notation.

Value

quoted array of character items

See Also

`qe`, `qae`, `bquote`

Examples

```

a <- "x"

qc(a) # returns the string "a" (not "x")

qc.(a) # returns the string "x" (not "a")

qc.(a) := a # returns c("x" = "a")

qc("a") # return the string "a" (not "\"a\"")

qc(sin(x)) # returns the string "sin(x)"

qc(a, qc(b, c)) # returns c("a", "b", "c")

qc(a, c("b", "c")) # returns c("a", "b", "c")

qc(x=a, qc(y=b, z=c)) # returns c(x="a", y="b", z="c")

qc('x'='a', wrapr::qc('y'='b', 'z'='c')) # returns c(x="a", y="b", z="c")

c(a = c(a="1", b="2")) # returns c(a.a = "1", a.b = "2")
qc(a = c(a=1, b=2)) # returns c(a.a = "1", a.b = "2")
qc(a := c(a=1, b=2)) # returns c(a.a = "1", a.b = "2")

```

qchar_frame

Build a quoted data.frame.

Description

A convenient way to build a character data.frame in legible transposed form. Position of first "`|`" (or other infix operator) determines number of columns (all other infix operators are aliases for "`|`"). Names are treated as character types.

Usage

```
qchar_frame(...)
```

Arguments

`...` cell names, first infix operator denotes end of header row of column names.

Details

`qchar_frame()` uses `bquote()` `.``()` quasiquotation escaping notation. Because of this using dot as a name in some places may fail if the dot looks like a function call.

Value

character data.frame

See Also

draw_frame, build_frame

Examples

```

loss_name <- "loss"
x <- qchar_frame(
  measure,           training,   validation |
  "minus binary cross entropy", .(loss_name), val_loss  |
  accuracy,         acc,         val_acc    )
print(x)
str(x)
cat(draw_frame(x))

qchar_frame(
  x |
  1 |
  2 ) %.>% str(.)

```

 qe

Quote expressions.

Description

Accepts arbitrary un-parsed expressions as to allow forms such as "Sepal.Length >= 2 * Sepal.Width". (without the quotes).

Usage

```
qe(...)
```

Arguments

... assignment expressions.

Details

qe() uses bquote() .() quasiquotation escaping notation.

Value

array of quoted assignment expressions.

See Also

qc, qae

Examples

```
ratio <- 2

exprs <- qe(Sepal.Length >= ratio * Sepal.Width,
            Petal.Length <= 3.5)
print(exprs)

exprs <- qe(Sepal.Length >= .(ratio) * Sepal.Width,
            Petal.Length <= 3.5)
print(exprs)
```

qs

Quote argument as a string.

Description

qs() uses bquote() .() quasiquotation escaping notation.

Usage

```
qs(s)
```

Arguments

s expression to be quoted as a string.

Value

character

Examples

```
x <- 7

qs(a == x)

qs(a == .(x))
```

reduceexpand *Use function to reduce or expand arguments.*

Description

The operators `%.|%` and `%|.%` are wrappers for `do.call`. These functions are used to pass arguments from a list to variadic function (such as `sum`). The operator symbols are meant to invoke non-tilted versions of APL's reduce and expand operators. Unevaluated expressions containing `%.|%`, `%|.%`, or `do.call` can be used simulate partial function application or simulate function Currying. The take-away is one can delegate all variadic argument construction to `list`, and manipulation to `c`.

Usage

```
f %|. % args
```

```
args %.| % f
```

Arguments

| | |
|-------------------|--|
| <code>f</code> | function. |
| <code>args</code> | argument list or vector, entries expanded as function arguments. |

Value

`f(args)` where `args` elements become individual arguments of `f`.

Functions

- `%|. %`: `f reduce args`
- `%.| %`: `args expand f`

See Also

`do.call`, `list`, `c`

Examples

```
# basic examples
1:10 %.| % sum
1:10 %.| % base::sum
1:10 %.| % function(...) { sum(...) }

# simulate partial application of log(., base=2)
1:4 %.>% do.call(log, list(., base = 2))

# # simulate partial application with dplyr
```

```
# # can be used with dplyr/rlang as follows
# d <- data.frame(x=1, y=2, z=3)
# syms <- rlang::syms(c("x", "y"))
# d %>% do.call(dplyr::select, c(list(.), syms))
```

```
restrictToNameAssignments
```

Restrict an alias mapping list to things that look like name assignments

Description

Restrict an alias mapping list to things that look like name assignments

Usage

```
restrictToNameAssignments(alias, restrictToAllCaps = FALSE)
```

Arguments

alias mapping list
restrictToAllCaps
 logical, if true only use all-capitalized keys

Value

string to string mapping

Examples

```
alias <- list(region= 'east', str= "'seven'")
aliasR <- restrictToNameAssignments(alias)
print(aliasR)
```

run_package_tests *Run package tests.*

Description

For all files with names of the form "`^test_+\\.R$`" in the package directory `unit_tests` run all functions with names of the form "`^test_+.$`" as RUnit tests. Attaches RUnit and `pkg`, requires RUnit. Stops on error.

Usage

```
run_package_tests(pkg, ..., verbose = TRUE,
  package_test_dirs = "unit_tests", test_dirs = character(0),
  stop_on_issue = TRUE, stop_if_no_tests = TRUE,
  require_RUnit_attached = FALSE, require_pkg_attached = TRUE,
  rngKind = "Mersenne-Twister", rngNormalKind = "Inversion")
```

Arguments

| | |
|-------------------------------------|---|
| <code>pkg</code> | character, name of package to test. |
| <code>...</code> | not used, force later arguments to bind by name. |
| <code>verbose</code> | logical, if TRUE print more. |
| <code>package_test_dirs</code> | directory names to look for in the installed package. |
| <code>test_dirs</code> | paths to look for tests in. |
| <code>stop_on_issue</code> | logical, if TRUE stop after errors or failures. |
| <code>stop_if_no_tests</code> | logical, if TRUE stop if no tests were found. |
| <code>require_RUnit_attached</code> | logical, if TRUE require RUnit be attached before testing. |
| <code>require_pkg_attached</code> | logical, if TRUE require <code>pkg</code> be attached before testing. |
| <code>rngKind</code> | pseudo-random number generator method name. |
| <code>rngNormalKind</code> | pseudo-random normal generator method name. |

Details

Based on <https://github.com/RcppCore/Rcpp/blob/master/tests/doRUnit.R>. This version is GPL-3, works derived from it must be distributed GPL-3.

Value

RUnit test results (invisible).

run_wrapr_tests *Run wrapr package tests.*

Description

Run the tests included with the wrapr package (assumes wrapr attached).

Usage

```
run_wrapr_tests(..., verbose = TRUE, package_test_dirs = "unit_tests",
  test_dirs = character(), stop_on_issue = TRUE,
  stop_if_no_tests = TRUE, require_RUnit_attached = FALSE,
  require_pkg_attached = TRUE, rngKind = "Mersenne-Twister",
  rngNormalKind = "Inversion")
```

Arguments

... not used, force later arguments to bind by name.

verbose logical, if TRUE print more.

package_test_dirs directory names to look for in the installed package.

test_dirs paths to look for tests in.

stop_on_issue logical, if TRUE stop after errors or failures.

stop_if_no_tests logical, if TRUE stop if no tests were found.

require_RUnit_attached logical, if TRUE require RUnit be attached before testing.

require_pkg_attached logical, if TRUE require pkg be attached before testing.

rngKind pseudo-random number generator method name.

rngNormalKind pseudo-random normal generator method name.

Value

RUnit test results (invisible).

seqi *Increasing whole-number sequence.*

Description

Return an increasing whole-number sequence from a to b inclusive (return integer(0) if none such). Allows for safe iteration.

Usage

```
seqi(a, b)
```

Arguments

| | |
|---|--------------------|
| a | scalar lower bound |
| b | scalar upper bound |

Value

whole number sequence

Examples

```
# print 3, 4, and then 5
for(i in seqi(3, 5)) {
  print(i)
}

# empty
for(i in seqi(5, 2)) {
  print(i)
}
```

sequence_as_function *Convert a sequence of expressions into a function.*

Description

Convert a sequence of expressions into a function.

Usage

```
sequence_as_function(dot_seq, env = parent.frame())
```

Arguments

dot_seq list of expressions.
env environment to work in.

Details

Note: not for steps that intend side-effects or have references to items in non-standard environments.

Value

function with signature (., eval_environment = parent.frame())

Examples

```
seq <- Collector() %.>% paste(., "a") %.>% paste(., "b")  
f <- sequence_as_function(seq)  
f("x")
```

show,PartialFunction-method
S4 print method

Description

S4 print method

Usage

```
## S4 method for signature 'PartialFunction'  
show(object)
```

Arguments

object item to print

show,PartialNamedFn-method
S4 print method

Description

S4 print method

Usage

```
## S4 method for signature 'PartialNamedFn'  
show(object)
```

Arguments

object item to print

show,SrcFunction-method
S4 print method

Description

S4 print method

Usage

```
## S4 method for signature 'SrcFunction'  
show(object)
```

Arguments

object item to print

```
show, UnaryFnList-method
      S4 print method
```

Description

S4 print method

Usage

```
## S4 method for signature 'UnaryFnList'
show(object)
```

Arguments

object item to print

```
sinterp            Dot substitution.
```

Description

String interpolation using `bquote`-style `.`(`.`) notation. Pure R, no C/C++ code called.

Usage

```
sinterp(str, ..., envir = parent.frame(), enclos = parent.frame(),
  match_pattern = "\\.\.\\(((\\^[^()]+)|\\(\\([^\n]*\\)))+\\)",
  removal_patterns = c("^\\.\\.\\(", "\\)$"))
```

Arguments

str charater string to be substituted into
 ... force later arguments to bind by name
 envir environemnt to look for values
 enclos enclosing evaluation environment
 match_pattern regexp to find substitution targets.
 removal_patterns regexprs to remove markers from substitution targets.

Details

See also <https://CRAN.R-project.org/package=R.utils>, <https://CRAN.R-project.org/package=rprintf>, and <https://CRAN.R-project.org/package=glue>.

Value

modified strings

Examples

```
x <- 7
sinterp("x is .(x), x+1 is .(x+1)\n.(x) is odd is .(x%%2 == 1)")

# Because matching is done by a regular expression we
# can not use arbitrary depths of nested parenthesis inside
# the interpolation region. The default regexp allows
# one level of nesting (and one can use {} in place
# of parens in many places).
sinterp("sin(x*(x+1)) is .(sin(x*{x+1}))")

# We can also change the delimiters,
# in this case to !! through the first whitespace.
sinterp(c("x is !!x , x+1 is !!x+1\n!!x is odd is !!x%%2==1"),
        match_pattern = '!!^[[:space:]]+[[[:space:]]?$',
        removal_patterns = c("^!!", "[[:space:]]?$"))
```

sortv

Sort a data.frame.

Description

Sort a data.frame by a set of columns.

Usage

```
sortv(data, colnames, ..., na.last = TRUE, decreasing = FALSE,
      method = c("auto", "shell", "radix"))
```

Arguments

| | |
|------------|--|
| data | data.frame to sort. |
| colnames | column names to sort on. |
| ... | not used, force later arguments to bind by name. |
| na.last | (passed to <code>order</code>) for controlling the treatment of NAs. If TRUE, missing values in the data are put last; if FALSE, they are put first; if NA, they are removed. |
| decreasing | (passed to <code>order</code>) logical. Should the sort order be increasing or decreasing? For the "radix" method, this can be a vector of length equal to the number of arguments in ... For the other methods, it must be length one. |

method (passed to `order`) the method to be used: partial matches are allowed. The default ("auto") implies "radix" for short numeric vectors, integer vectors, logical vectors and factors. Otherwise, it implies "shell". For details of methods "shell", "quick", and "radix", see the help for `sort`.

Value

ordering permutation

See Also

`orderv`

Examples

```
d <- data.frame(x = c(2, 2, 3, 3, 1, 1), y = 6:1)
sortv(d, c("x", "y"))
```

```
split_at_brace_pairs
```

Split strings at -pairs.

Description

Split strings at -pairs.

Usage

```
split_at_brace_pairs(s, open_symbol = "{", close_symbol = ")")
```

Arguments

`s` string or list of strings to split.

`open_symbol` symbol to start marking.

`close_symbol` symbol to end marking.

Value

array or list of split strings.

Examples

```
split_at_brace_pairs("{x} + y + {z}")
```

`srcfn`*Wrap the source for an expression as a function.*

Description

Wrap the source for an expression as a function.

Usage

```
srcfn(expr_src, arg_name = ".", args = list())
```

Arguments

| | |
|-----------------------|--|
| <code>expr_src</code> | character, source code of expression. |
| <code>arg_name</code> | character, name of argument to assign. |
| <code>args</code> | named list of additional arguments and values. |

Value

SrcFunction

See Also

`fnlist`, `pkgfn`, `wrapfn`

Examples

```
f <- srcfn(". + z", ".", args = list(z = 10))
cat(format(f))
1:3 %.>% f
```

`SrcFunction-class`*Code text as a new partial function.*

Description

Code text as a new partial function.

`stop_if_dot_args` *Stop with message if dot_args is a non-trivial list.*

Description

Generate a stop with a good error message if the dots argument was a non-trivial list. Useful in writing functions that force named arguments.

Usage

```
stop_if_dot_args(dot_args, msg = "")
```

Arguments

| | |
|-----------------------|--|
| <code>dot_args</code> | substitute(list(...)) from another function. |
| <code>msg</code> | character, optional message to prepend. |

Value

NULL or stop()

Examples

```
f <- function(x, ..., inc = 1) {
  stop_if_dot_args(substitute(list(...)), "f")
  x + inc
}
f(7)
f(7, inc = 2)
tryCatch(
  f(7, 2),
  error = function(e) { print(e) }
)
```

`strsplit_capture` *Split a string, keeping separator regions*

Description

Split a string, keeping separator regions

Usage

```
strsplit_capture(x, split, ..., ignore.case = FALSE, fixed = FALSE,
  perl = FALSE, useBytes = FALSE)
```

Arguments

| | |
|--------------------------|---|
| <code>x</code> | character string to split (length 1 vector) |
| <code>split</code> | split pattern |
| <code>...</code> | force later arguments to bind by name |
| <code>ignore.case</code> | passed to <code>gregexpr</code> |
| <code>fixed</code> | passed to <code>gregexpr</code> |
| <code>perl</code> | passed to <code>gregexpr</code> |
| <code>useBytes</code> | passed to <code>gregexpr</code> |

Value

list of string segments annotated with `is_sep`.

Examples

```
strsplit_capture("x is .(x) and x+1 is .(x+1)", "\\.[^()]+\\")
```

UnaryFn-class *Functions that take a single argument*

Description

Functions that take a single argument

UnaryFnList-class *List of Unary functions taken in order.*

Description

Unary functions are evaluated in left to right or first to last order.

uniques *Strict version of unique (without ...).*

Description

Check that `...` is empty and if so call `base::unique(x, incomparables = incomparables, MARGIN = MARGIN, fromLast = fromLast)` (else throw an error)

Usage

```
uniques(x, ..., incomparables = FALSE, MARGIN = 1, fromLast = FALSE)
```

Arguments

| | |
|----------------------------|--|
| <code>x</code> | items to be compared. |
| <code>...</code> | not used, checked to be empty to prevent errors. |
| <code>incomparables</code> | passed to <code>base::unique</code> . |
| <code>MARGIN</code> | passed to <code>base::unique</code> . |
| <code>fromLast</code> | passed to <code>base::unique</code> . |

Value

`base::unique(x, incomparables = incomparables, MARGIN = MARGIN, fromLast = fromLast)`

Examples

```
x = c("a", "b")
y = c("b", "c")

# task: get unique items in x plus y
unique(c(x, y)) # correct answer
unique(x, y)    # oops forgot to wrap arguments, quietly get wrong answer
tryCatch(
  uniques(x, y), # uniques catches the error
  error = function(e) { e })
uniques(c(x, y)) # uniques works like base::unique in most case
```

vapplym *Memoizing wrapper for vapply.*

Description

Memoizing wrapper for vapply.

Usage

```
vapplym(X, FUN, FUN.VALUE, ..., USE.NAMES = TRUE)
```

Arguments

| | |
|-----------|---------------------------------------|
| X | list or vector of inputs |
| FUN | function to apply |
| FUN.VALUE | type of vector to return |
| ... | additional arguments passed to lapply |
| USE.NAMES | passed to vapply |

Value

vector of results.

See Also

VectorizeM, lapplym

Examples

```
fs <- function(x) { x <- x[[1]]; print(paste("see", x)); sin(x) }
# should only print "see" twice, not 6 times
vapplym(c(0, 1, 1, 0, 0, 1), fs, numeric(1))
```

VectorizeM *Memoizing wrapper to base::Vectorize()*

Description

Build a wrapped function that applies to each unique argument in a vector of arguments once.

Usage

```
VectorizeM(FUN, vectorize.args = arg.names, SIMPLIFY = TRUE,
  USE.NAMES = TRUE, UNLIST = FALSE)
```

Arguments

| | |
|-----------------------------|--|
| <code>FUN</code> | function to apply |
| <code>vectorize.args</code> | a character vector of arguments which should be vectorized. Defaults to first argument of <code>FUN</code> . If set must be length 1. |
| <code>SIMPLIFY</code> | logical or character string; attempt to reduce the result to a vector, matrix or higher dimensional array; see the <code>simplify</code> argument of <code>sapply</code> . |
| <code>USE.NAMES</code> | logical; use names if the first ... argument has names, or if it is a character vector, use that character vector as the names. |
| <code>UNLIST</code> | logical; if <code>TRUE</code> try to unlist the result. |

Details

Only sensible for pure side-effect free deterministic functions.

Value

adapted function (vectorized with one call per different value).

See Also

`Vectorize`, `vapplym`, `lapplym`

Examples

```
fs <- function(x) { x <- x[[1]]; print(paste("see", x)); sin(x) }
fv <- VectorizeM(fs)
# should only print "see" twice, not 6 times
fv(c(0, 1, 1, 0, 0, 1))
```

view

Invoke a spreadsheet like viewer when appropriate.

Description

Invoke a spreadsheet like viewer when appropriate.

Usage

```
view(x, ..., title = wrapr_deparse(substitute(x)), n = 200)
```

Arguments

| | |
|-------|--|
| x | R object to view |
| ... | force later arguments to bind by name. |
| title | title for viewer |
| n | number of rows to show |

Value

invoke view or format object

Examples

```
view(mtcars)
```

```
wrapfn
```

Wrap the source for an expression as a function.

Description

Wrap the source for an expression as a function.

Usage

```
wrapfn(fn, arg_name = ".", args = list())
```

Arguments

| | |
|----------|--|
| fn | function. |
| arg_name | character, name of argument to assign. |
| args | named list of additional arguments and values. |

Value

PartialFunction

See Also

pkgfn, fnlist, srcfn

Examples

```
f <- wrapfn(sin, "x")
cat(format(f))
1:3 %>% f
```

| | |
|-------|---|
| wrapr | <i>wrapr: Wrap R Functions for Debugging and Parametric Programming</i> |
|-------|---|

Description

Provides `DebugFnW()` to capture function context on error for debugging, and `let()` which converts non-standard evaluation interfaces to parametric standard evaluation interfaces. `DebugFnW()` captures the calling function and arguments prior to the call causing the exception, while the classic options (`error=dump.frames`) form captures at the moment of the exception itself (thus function arguments may not be at their starting values). `let()` rebinds (possibly unbound) names to names.

Details

| | |
|------------|-----------------------------------|
| %in_block% | <i>Inline let-block notation.</i> |
|------------|-----------------------------------|

Description

Inline version of `let-block`.

Usage

```
a %in_block% b
```

Arguments

- | | |
|---|---|
| a | (left argument) named character vector with target names as names, and replacement names as values. |
| b | (right argument) expression or block to evaluate under let substitution rules. |

Value

evaluated block.

See Also

let

Examples

```
d <- data.frame(
  Sepal_Length=c(5.8,5.7),
  Sepal_Width=c(4.0,4.4),
  Species='setosa')

# let-block notation
let(
  qc(
    AREA_COL = Sepal_area,
    LENGTH_COL = Sepal_Length,
    WIDTH_COL = Sepal_Width
  ),
  d %.>%
  transform(., AREA_COL = LENGTH_COL * WIDTH_COL)
)

# %in_block% notation
qc(
  AREA_COL = Sepal_area,
  LENGTH_COL = Sepal_Length,
  WIDTH_COL = Sepal_Width
) %in_block% {
  d %.>%
  transform(., AREA_COL = LENGTH_COL * WIDTH_COL)
}

# Note: in packages can make assignment such as:
# AREA_COL <- LENGTH_COL <- WIDTH_COL <- NULL
# prior to code so targets don't look like unbound names.
```

`%c%`*Inline list/array concatenate.*

Description

Inline list/array concatenate.

Usage`e1 %c% e2`

Arguments

e1 first, or left argument.
e2 second, or right argument.

Value

c(e1, c2)

Examples

```
1:2 %c% 5:6
```

```
c("a", "b") %c% "d"
```

%dot%

Inline dot product.

Description

Inline dot product.

Usage

```
e1 %dot% e2
```

Arguments

e1 first, or left argument.
e2 second, or right argument.

Value

c(e1, c2)

Examples

```
c(1,2) %dot% c(3, 5)
```

`%p%` *Inline character paste0.*

Description

Inline character paste0.

Usage

`e1 %p% e2`

Arguments

`e1` first, or left argument.
`e2` second, or right argument.

Value

`c(e1, c2)`

Examples

```
"a" %p% "b"  
c("a", "b") %p% "_d"
```

`%qc%` *Inline quoting list/array concatenate.*

Description

Inline quoting list/array concatenate.

Usage

`e1 %qc% e2`

Arguments

`e1` first, or left argument.
`e2` second, or right argument.

Value

`qc(e1, c2)`

Examples

1:2 %qc% 5:6

c("a", "b") %qc% d

a %qc% b %qc% c
